Caissons. When the site of the proposed building is of small area, and the depth of water is great, or in cases where the nature of the soil, such as a deep bed of sand, would render it almost impossible to keep the well of a dam dry, the foundations are often made by means of a caisson. This is a watertight box of suitable dimensions to hold the masonry of a pier and its footings (and also the workmen engaged in building it), which is floated over the site of the proposed pier, &c., that has previously been dredged and levelled. It is anchored between two piles at each end of the site, and iron angle guides are bolted to the sides of the caisson, on each side of the piles; these allow of downward movement, but keep the caisson centrally over the site. The building is now commenced and carried on inside the caisson directly upon its bottom, which is constructed of thick elm planking. This is made detachable, and when, as the work proceeds and the weight of the material causes the caisson to sink to the bottom, the bolts are withdrawn, the sides float upwards leaving the bottom to act as a permanent foundation. Before the water is admitted it is advisable to send a diver down to examine the foundation to see if any packing is required.

New York's Projected Tunnel.—A tunnel is to be made from the City Hall to the northen boundary of New York, but it will take ten years to complete. Trains are to be run in it at the rate of sixty miles an hour, which will bring one end of the city within twenty minutes of the other, and there will be no dust or smoke, as electricity will be the motive power. Tenders are now being advertised for the work.

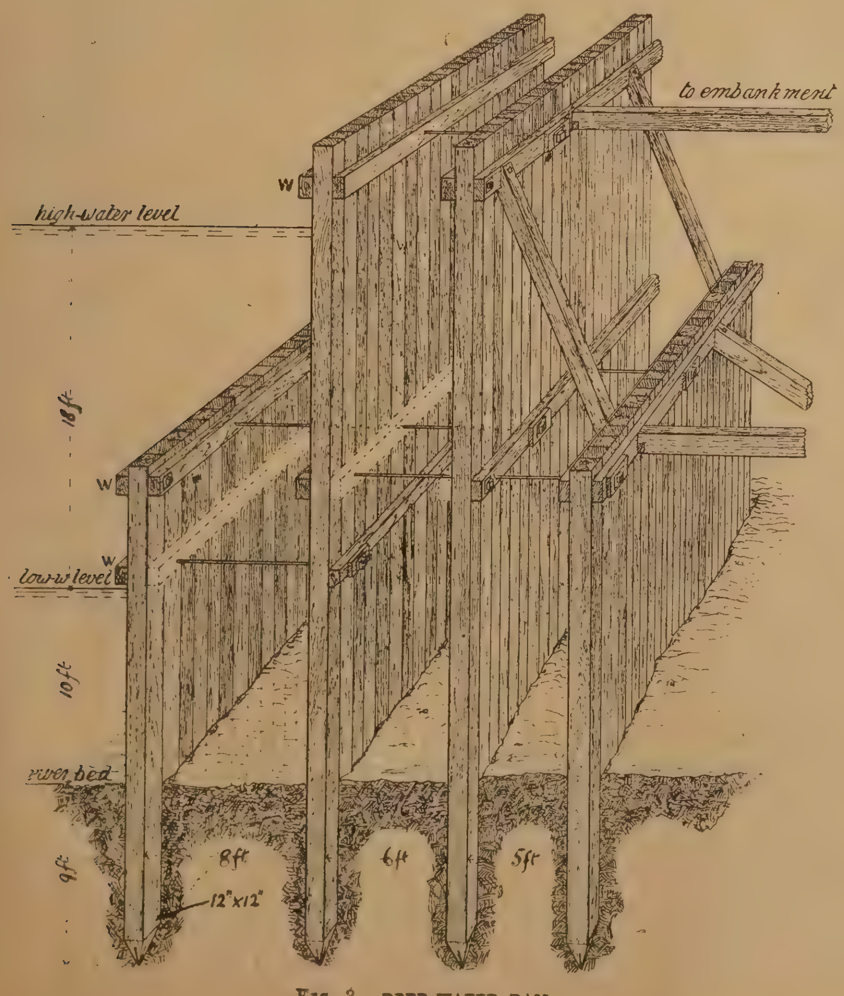

FIG. 3.—DEEP-WATER DAM.

Masters and Men.

Scotch Steel Trade Dispute.—In reply to the men's demands for an immediate advance of 5 per cent. in wages, the Scotch steelmasters have replied that they will grant 2½ per cent. increase on December 1st, and a second 2½ per cent. on January 1st. The men's officials have refused the offer.

United Operative Plumbers.—In his report to the United Operative Plumbers' Association of Great Britain and Ireland for the third quarter of this year, Mr Cherry says there had been an increase in the membership of 130. The total expenditure was £3,307 18s. 9½d., and the chief items were:—Travelling benefits, £238 4s. 3d.; sick benefit, £955 15s. 8d.; superannuation benefit, £191 17s.; strike pay, £905 9s. 1d.; and funeral benefit, £257 17s. 6d.

A General Strike in the Bradford Building Trade is now pending in consequence of the boom of trade. The operatives' societies are in harmony in making the demands, while the masters seem disposed to resist, or at least to temporise. The plasterers and labourers have taken the initiative by demanding advances of 1½d. and 1d, from 8½d. and 6d. an hour respectively. Notices have been served upon the masters which will expire on December 31st, and up to the present the conferences held have failed to bring about a satisfactory settlement. With every prospect of unusual activity in the building trades, the outlook is regarded with some degree of alarm. The present schemes on foot include the erection of the Cartwright Memorial Hall, central and district baths, market extensions, electricity works extentions, Town Hall extensions, workmen's dwellings, a new central fire brigade station, a new board school, and other large undertakings, besides the ordinary building operations of the city. The joiners in Bradford are also demanding an advance of 1d. per hour, the present rate being 8½d. The notices in this case expire on May 1st next.

THE NEW SUBWAY.

WHEN a site opposite the Bank of England was granted to the Central London Railway Company for their terminus, it was on the understanding that they should construct a public subway which, besides serving as an entrance and exit to the station, would connect with all the thoroughfares in the locality. Seven independent staircases lead to the subway, which is 15ft. wide and 10ft. high, and runs round a large central hall in which the company's booking offices will be situated. In this hall there are five iron-lined shafts, 60ft. deep, in which lifts will work; these have been supplied by the Sprague Elevator Company, of New York, and it will be remembered that they were the subject of some controversy a short time ago. The smallest lift will carry fifty persons, and the largest 100. The hall is covered by a steel trough roof covered with a 2in. layer of concrete and a topping of asphalte, which of course forms the road surface over which the great streams of traffic around the Mansion House pass. Glazed white tiles have been used for lining the subway. The work, which has been carried out most successfully, presented many great difficulties, not the least of which was that of dealing with the great underground mains; for instance, there was a 30in. gas main, a 24in. gas main, two 24in. water mains, and a main containing hydraulic pressure of 800lbs. Before these could be touched another subway had to be made to receive the new service pipes, and below all was a brick sewer 8ft. wide and 7ft. high, which could not, however, be diverted, and now runs between two of the lift shafts. The subway has been designed and carried out under the supervision of Mr. Basil Mott, and is certainly a great success and a decided addition to the brilliant list of the engineering achievements of the present century.

Builders' Notes.

A Crane Accident.—On Thursday last a twenty-ton travelling crane on the end of the Admiralty Pier Extension at Dover toppled into the sea.

The glazing at the Nottingham Central Station is being done by Messrs. Mellowes and Co., of Sheffield, on their patent "Eclipse" system.

Labourers' Cottages.—In their issue for November 24th the "Daily News" published a perspective, some plans and a section of a country labourer's cottage, estimated to cost £100. One living room, three bedrooms, a scullery, store, and closet are provided.

Paper Roofs.—A thick tarred pasteboard is now made by the Tokio Card and Pasteboard Co., the largest of its kind in Japan, as a substitute for shingles for roofing. It has a good sale, being 50 per cent. cheaper and more easily managed than the wooden article.

For letting Houses before obtaining certificates from the borough surveyor that they were fit for human habitation, Thomas Brown, a builder, was fined last week at Barrow £3 (£1 in respect of each house) and costs; Councillor J. H. Neal was fined £2 and costs for a similar offence.

The "Princess" Gas Fire, patented and made by Messrs. R. and A. Main, Limited, of London, Glasgow, Falkirk, Tottenham, Manchester, Bristol and Birmingham, will fit any grate and is most suitable for offices, &c. It gives a quick bright fire and a healthy heat with a low consumption of gas, and can be hired from gas companies at the rate of 1s. 6d. per quarter.

150,000 tons of rock was blown up recently at the Bonawe granite quarries, 12,000lbs. of gunpowder being used. "It was a wonderful sight," says one, "to see 250ft. of rock by 150ft. on the surface and 50ft. deep rise gradually for 6ft. or 8ft. and then collapse in a multitude of pieces, some of them weighing from 2,000 to 3,000 tons, and scatter themselves over the floor of the quarry."

At the Slate Merchants' Congress, held last week at Liverpool, Mr. Clement Braby (the president) stated that the association was increasing its membership, and now included about three-fourths of the slate trade of England. The hope was expressed that efforts would be made to federate all the national associations of building trades employers into one organization.

The Birmingham Master Builders' Association held its annual meeting on November 21st, and in the evening held a dinner. The association has now a balance in hand of about £218. Referring to the building trade, Mr. T. G. Price said that one in every seven of the working population of the country belonged to one or another of the various branches, and the employers paid upwards of £60,000,000 a year in wages.

Milne's Syphonic Chimney-top.—In our issue of March 9th, 1898, we drew attention to an appliance designed by Mr. E. P. Milne, of 15, Craven Street, London, W.C., for preventing down-draught and increasing the up-draught in sluggish chimneys. We are pleased to learn that this device has proved to be one of the best inventions for curing a smoky chimney. Mr. Milne is now executing a number of repeat orders—a fact which speaks for itself.

Building in Scarborough.—It is expected that the proposed change to be made in the system of disposing of the ground on Weaponness estate, belonging to the Corporation, will give an impetus to the building of villas on South Cliff, Scarborough. The Local Government Board has given its sanction to the plots being sold for a gross sum, on condition that the Corporation undertakes that all purchase monies received from the sale shall be applied to a fund for the redemption of loans.

Somebody's Fault.—Some new buildings have been erected in Carr Lane, Hull, for the Constitutional Club, and a heavy cornice had been placed in position. Last week this all fell down and was smashed; fortunately, nobody was injured seriously. It has been stated that the work was green, and that the cornice was not sufficiently weighted at the back; but builders ought to know the elements of their business.

A Large Column.—A piece of granite has been quarried in America which, when turned up, will be 54ft. long and 6ft. 3in. in diameter. It will be the first of eight columns which are destined to support the great dome of the Episcopal Cathedral of St. John the Divine, in New York. Two of the eight columns are to be of this size; the other six are to be of the same diameter bnt 52ft. in length. There is now being built for this work a special lathe costing between £3,000 and £4,000. The stone for the General Worth Monument, which was afterwards erected in New York, weighed 175 tons when quarried, but was found to contain a slight defect, and the contractors were obliged to furnish another. This monolith came from the famous Sands Quarry, which also supplied the stone for the Washington Post Office building and other notable structures.

Lancashire Asylums Board. — At the annual meeting of this Board on Thursday last the report of the Finance and General Purposes Committee was adopted. This recommended that £20,000 should be borrowed to meet the cost of making bricks for the new asylum at Winwick, and stated that the sanction of the Local Government Board had been obtained to borrow the following sums:—£21,817 for electric light installation and £8,900 for the new male infirmary at Prestwich; £22,315 for new reception and acute wards, and £4,800 for their furnishing. It was decided to grant £1,337 for erecting and fitting up a laboratory and museum for pathology and bacteriology at Lancaster Asylum, £6,000 for altering and relaying drains and treating sewage at Whittingham, and £7,000 for providing new farm buildings at Winwick Asylum.

London County Council.—At the meeting held on November 21st it was resolved to seek Parliamentary powers to reconstruct for electric traction the tramways between Westminster Bridge Road and Tooting and between Blackfriars Bridge and the junction near "The Horns" at Kennington. This is estimated to cost £251,000. Mr. Shaw Lefevre stated that the Strand widening scheme (by pulling down the Holywell Street houses) was being pushed forward, and the chairman of the Technical Education Board said that a grant of £2,500 a year each had been made for the maintenance of a faculty of commerce and a faculty of engineering at the University of London. The recommendation of the Parliamentary Committee that powers should be sought by a public Bill to allow burial authorities to provide crematoria was adopted, and the Council approved the draft orders with regard to the proposed light railways on Clapham and Kingston Road, New Cross and Eltham, and Archway Road, Highgate.

Letters may be Contracts.—In the High Court of Justice on November 20th the case of Croshaw v. Pritchard and Renwick was heard before Mr. Justice Bigham. The plaintiff was the owner of certain freehold premises in Bermondsey, and the defendants were builders. On August 22nd last, the plaintiff's architects wrote to the defendants stating that their client was about to make additions to his property, and asking for a tender in competition for the work. No quantities would be supplied, and their client did not bind himself to accept the lowest or any tender. Subsequently the specification was sent to the defendants, and on September 14th the defendants wrote to the plaintiff the following letter, which was headed "Estimate":—"Our estimate to carry out the sundry alterations to the above premises according to the drawings and specification amounts to the sum of £1,230." On the next day the plaintiff wrote that he accepted the defendants' offer, but later the defendants wrote to say that they had made an error in their figures, and that under the circumstances they must withdraw their estimate. The plaintiff had the work done by another builder at a price higher than that given by defendants, and he now brought this action to recover the difference in price as damages for breach of contract. The question was whether there was a complete contract binding on the defendants. Their contention was that their letter of September 14th was not a binding tender; that the word "estimate" was advisedly used by them in order to avoid a final and binding agreement, which would have resulted from the use of such words as "we offer to execute the work." Evidence was given by several builders to show that this distinction was always observed in the trade.—Mr. Justice Bigham said that the plaintiff's letter of August 22nd was an invitation to the defendants to send in a tender in competition for the work. That meant that they were to state the price at which they would do the work; and the specification was sent in order that they might have the necessary materials upon which to tender. Then, on September 14th, the defendants sent the letter headed "Estimate," and the question was whether that letter was an offer to do the work at the price mentioned. His Lordship was clearly of opinion that it was. It was said that there was no complete contract, because in the specification there was a blank left as to the time within which the work was to be completed. In the ordinary course a subsequent agreement would be come to as to the time, but if there was no subsequent agreement then the work would have to be done in a reasonable time but the absence of any such subsequent agreement would not have the effect of setting aside the already existing contract. The defendants had made a mistake, and they must abide by the consequences of it. There would be judgment for the plaintiff for £250, with costs.

Surveying and Sanitary Notes.

For sewerage works in the Settle District, £4,699 is proposed to be spent.

For forming thirty-five new streets at Morecambe, at the east and west ends of the town, it is proposed to borrow £9,700.

Liverpool Ladies' Sanitary Association.—At the recent annual meeting of this association, it was stated that during the present year three former students had been appointed to posts as lady sanitary inspectors—one in Liverpool (where there are already three), one in Leeds, and one in London.

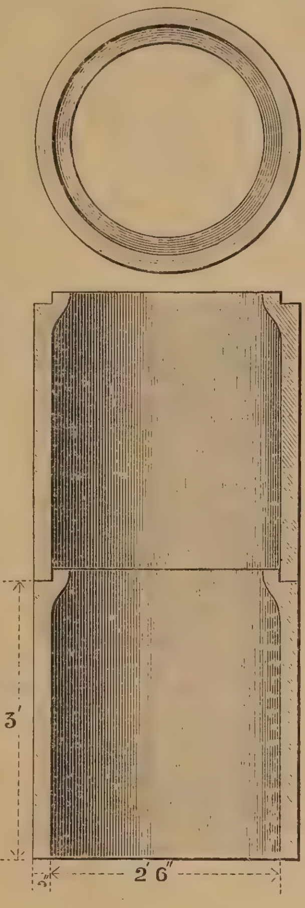
An Unsuccessful Sewage Farm.—Four months ago at Pierrelaye a sewage farm was opened, when the inhabitants were told that their soil would develop the most extraordinary fertility, and that Pierrelaye would become a centre of the market gardening industry. It has, says the Paris correspondent of the "Pall Mall Gazette," become a swamp permeated through and through by sewage. For this result to have been arrived at somebody, of course, must have blundered. It seems to have been the engineers. They affirmed that the soil at the Pierrelaye Farm would be capable of soaking up the 50,000 cubic metres of sewage water that has to be dealt with daily. It turns out that the ground, which is composed in parts of clay and rock, will not do this, and the sewage runs away through underground fissures on to the adjacent land. Water is now supplied to the inhabitants from carts.

Rural Insanitation. — The following is taken from the "Globe":—While at most great centres of population in England due attention is now paid to sanitation, as much cannot be said for the smaller towns and villages. Among them, the standing rule seems to be to do nothing in the way of improvement until some bad outburst of disease occurs. Then, consternation, panic, and hysterical clamour for instantaneous remedies of a thoroughly effectual character make things unpleasant for the responsible authorities. Sometimes, as at Wrexham just now, cottages long since condemned as unfit for human habitation are suffered to remain as death traps for the unwary, without the slightest attempt being made to improve their condition. What the consequences are may be gathered from the painful experiences through which the Chorley district is now passing. Sanitation having been neglected in the past, scarlet fever and typhoid struck such strong roots that 700 cases are now under treatment, and there seems every likelihood of the number being largely augmented. As usual, assurance is given that the authorities are adopting every precaution to prevent the epidemic from spreading. But it would have been more sensible, and far less expensive, to have done that before the outbreak. In most of these cases the main deterrent to official action is the fear of incurring unpopularity by inflating the rates. The older inhabitants see no reason for worrying themselves about remedial measures, without which they and their forefathers always got on quite comfortably, and the authorities fall in with this sentiment by remaining supine until forced to take action by panic.

Trade and Craft.

WELL SINKING.

There is often a great deal of anxiety experienced by those responsible for the sinking of a well, and anything which tends either to facilitate the construction, and so reduce the expense, is likely to receive the support of those connected with this branch of engineering. Messrs. Oates and Green, Ltd., of Halifax, are the sole manufacturers and patentees of a stoneware tube which saves labour and dispenses with wall supports in shaft sinking. We illustrate these tubes on this page. When the diggers have worked downwards a few feet one of the tubes is let into the hole, and it sinks gently and evenly by its own weight until the bottom is reached. After a further depth has been delved another tube is put on the top of the first one, which now sinks lower, the second tube sinking into the previous position of the first one. This process is continued as required to any depth. The tubes are extremely strong and will withstand great pressures, and are intended to remain in the shaft as a permanent support to prevent the earth falling in. The inside projecting rim serves as a support on which the workman can hang his ladder. A large quantity of tubes of 24in., 30in., and 36in. diameter is kept in stock, though other sizes can be obtained to order.



TUBES FOR WELL SINKING.

The proposal to construct tramways at Bournemouth, after suffering strenuous opposition for several years, has now been adopted by the Town Council.

Otley's Waterworks Scheme.—The Otley District Council have decided to promote a Bill in Parliament to enable them to purchase the waters of March Ghyll and its tributaries, in the township of Middleton, and also land for constructing a reservoir. This scheme is estimated to cost £43,000.

Engineering Notes.

For extending the Harrogate electricity works the Corporation propose to spend £28,000.

Electricity for all South Wales is the object of a Bill to be brought forward during the next Parliamentary session by the South Wales Electrical Power Distribution Company. It is proposed to establish generating stations at Panteg, near Pontypool, at Treforest, near Pontypridd, and at Neath, and from there to take cables alongside the railways to practically all the chief towns in South Wales.

The Barrage of the Nile.—Egypt, said Mr. Alderman Bowes at the recent meeting of the Manchester Geographical Society, was watered not by the rain but by the river. Napoleon, when he was in Egypt, proposed to construct dams, but was unable to carry out his scheme. Mehemet Ali began the Rosetta and Damietta dams in 1833. The plan adopted was to build two bridges, one of seventy-one arches and the other of sixty-one arches, with iron gates and sluices. The work was carried out by a celebrated French engineer, and cost nearly two millions. But through bad workmanship it was not a success, and did not hold up much more than half the water that was expected. Constant repairs were necessary, and in 1883 the dams were declared useless, and were put into the hands of Sir Colin Scott Moncrieff for thorough overhauling and repair. This work was completed in 1890, and when reconstructed the dams held up more than four metres of water above ordinary river level. Since Great Britain became the paramount Power in the administration of the finances of Egypt many schemes had been proposed for impounding more of the waters of the Nile. The work now being done at Assouan (590 miles above Cairo) and Assiout (250 miles) Mr. Bowes described in detail. The contractors for these dams were Messrs. John Aird and Co., with Sir Benjamin Baker as chief engineer. The First Cataract at Assouan was now a scene of bustling activity, and much progress had already been made with the work: from 500 to 600 European officials and workmen were employed, and about 10,000 natives. The Nile at this point was about a mile wide, and the channel at low water was broken by a labyrinth of rocky islets and ridges. It was on this foundation that the great dam would be built. It would be over a mile long, 80ft. wide at the base, and the top would be 90ft. above low-water mark. It would be pierced with 180 sluices for the regulation of the flood waters, and would raise the level of the river for 140 miles above the First Cataract. The dam at Assiout would be much shorter and not so high as that at Assouan. About a thousand men were employed on this part of the work. The scheme would not be completed for thirty years, and the total cost was to be £4,800,000.

Property and Land Sales.

FREEHOLD BUILDING LAND to be LET on LEASE, or SOLD in PLOTS; fronting on main road, and close to golf links and Highgate Woods; near Muswell Hill and East Finchley Stations. Liberal advances if required to responsible Builders.—For plans and particulars apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington Road, N. 10

To Architects, Builders, and Investors. — City of London.—To be Let on Building Lease, with option to buy the freehold, very valuable building sites in the new centre of commerce formed by the thoroughfare known as Lloyd's-avenue, leading from Fenchurch-street to Crutched-friars, where already important plots have been disposed of and are now in course of development.

MESSRS. JONES, LANG, AND CO., are instructed to offer by AUCTION, at the Mart, E.C., on THURSDAY, NOVEMBER 30th, 1899, at TWO o'clock, in Lots, to be let on Building Lease for 80 years, the very important and valuable BUILDING LAND, in Lloyd's-avenue, Fenchurch-street, City of London, ripe for immediate development, as follows:—

Plot of land, frontage 80ft. to Lloyd's-avenue, area 8,160ft.

Plot of land, frontage 60ft. to Lloyd's avenue, area 13,240.

Plot of land, frontage 60ft. to Lloyd's-avenue, area 9,270ft.

Plot of land, frontage 57ft. to Lloyd's avenue, area 5,350ft.

Plot of land, frontage 21ft. to Crutched-friars, and 69ft. to Lloyd's-avenue, area 1,350ft.

Plot of land, frontage 49ft. to Lloyd's-avenue, 54ft. to Crutched-friars, 42ft. to Northumberland-alley, area 2,450ft.

Plot of land, frontage 54ft. to Lloyd's-avenue, and 54ft. to Northumberland-alley, area 3,120ft.

Plot of land, frontage 69ft. to Lloyd's-avenue, and 74ft. to Northumberland-alley, area 4,220ft. super.

Particulars, with plans and conditions of letting, can be had at the Mart, E.C.; of Messrs. TURNER, SON, and FOLEY, Solicitors, 101, Leadenhall-street, E.C.; of Messrs. DAVIS and EMANUEL, Architects, 2, Finsbury-circus, E.C.; or of the AUCTIONEERS, 3, King-street, Cheapside, London, E.C.

SOUTH KENSINGTON.—Important Freehold Building Site, specially suitable for the erection of residential flats, and occupying an area of about 18,500 superficial feet.

By direction of the Executors of the late Captain Nislet, deceased.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY and CO. will SELL by AUCTION, at the Mart, E.C., on THURSDAY, DECEMBER 14th, 1899, at TWO o'clock precisely, the valuable FREEHOLD old-fashioned RESIDENCE and GROUNDS, known as "Hollywood Lodge," Hollywood-road, having a frontage thereto of 104ft., and a return frontage of 173ft. to Fawcett-street, and occupying a commanding corner position, about half-a-mile from Earl's-court and South Kensington Railway Stations, and close to the Fulham-road, and in direct communication with the West End and City omnibus route. With possession.

May be viewed, and particulars, plan, and conditions of sale obtained of Messrs. SANDILANDS and Co, Solicitors, 12, Fenchurch-avenue, Fenchurch-street, E.C.; at the Mart, E.C.; and of Messrs. FAREBROTHER, ELLIS and Co., 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

SALE DAYS for the Year 1899.
Messrs.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, Dec. 7 | Thursday, Dec. 14

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

R. I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses. — For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

MODELS.
For Exhibitions or Law Cases.
Illustrations sent of Work Executed.
JOHN B. THORP, 98, Gray's Inn-road, W.C.

A CIVIL ENGINEER (energetic) with considerable practical experience abroad, especially on railways, wishes to JOIN a well-established FIRM of BUILDERS and CONTRACTORS, about a year hence, as Advertiser has an engagement abroad. Applications will be registered now for future consideration. Advertiser will be able to put £500 in the concern.—Fullest particulars to "S.," 18, Featherstone-buildings. 1

TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.

J. G. FAULDS'

IMPROVED

Multiplex Stone-Cutter.

Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.

These IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

An Architectural Causerie.

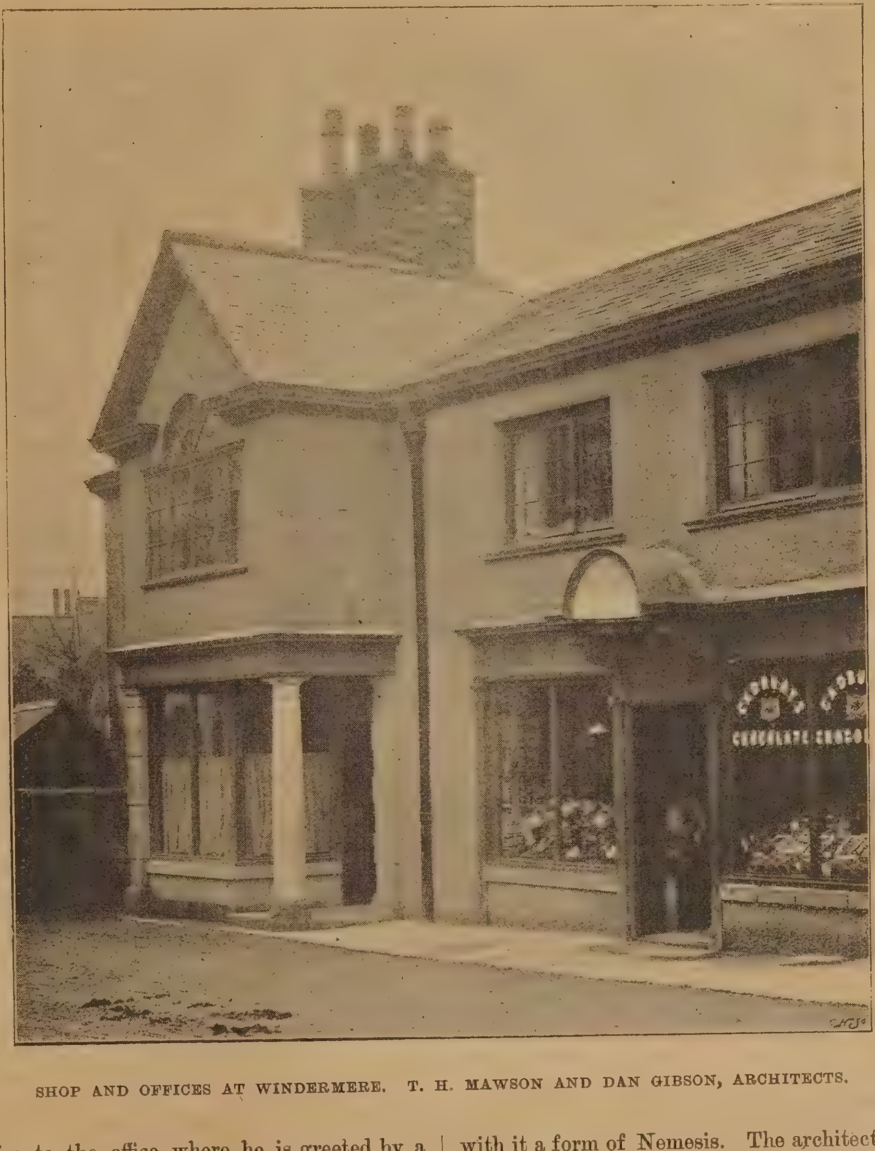
Physical Influences Affecting Design. Sterne tells us that before he sat down to write he always put on a clean shirt and his best silk breeches: this was no idle jest; the witty parson knew the importance of working under the most favourable conditions, and the nicety of his attire is reflected in the daintiness of his language. We might grant the clean shirt, but no one would expect an architect to work in his best clothes; most of us have an ancient and easy coat, shiny, indeed, at the elbows from constant contact with the drawing board, a coat, nevertheless, which we hold in affectionate regard, for, without it, we should consider ourselves but scantily armed to face the problems which we have to encounter; but this is not enough. Besides his magic sword and winged sandals, the Perseus of ancient legend was gifted with one further safeguard, unmentioned, indeed, in explicit terms, but directly implied by his success—perfect health—it is nowhere recorded that he was troubled by a cold, or that his nerves were unstrung. We moderns cannot, of course, expect complete immunity from ills such as these, but we can do much to lessen them if we once appreciate the influence of our own physical surroundings upon our work. Above all things, let him who would design well avoid worry and all that conduces thereto. We must all remain more or less subject to those "whips and scorns of Time" which weighed so heavily on Hamlet; at these it is useless to grumble, they will plague us from time to time be we never so careful, and indeed they will but brace up and invigorate a sturdy nature, for Time brings his revenges. It is the little worries, which might have been avoided, which gall us most. Who can sit calmly to his work while the small speculation which he confidingly made in "Great Bunkers" is dwindling by sixteenths to par, or forget in the studio the embarrassment arising from excessive expenditure in the house.

Another pernicious influence is an itching eagerness to put things straight, to join crusades, social or political. Think of the splendid isolation of Sir Christopher Wren through all the political turmoil and excitement of his time. Unrest of the mind will certainly show itself through the creations of the brain; the design of some men of great talent bears traces of the restless, nervous excitement, stirred up by controversy, and not yet soothed, when they set about their work. Our censors of the press and platform are never tired of reminding us of the depth of our fall, from the high perfection of the artists of the Grecian and Gothic periods; but let them pause for a moment, and contrast the physical surroundings of the architect monk of the thirteenth century with those of the architect citizen of the nineteenth. How can they expect the same quiet dignity and repose to show itself in the buildings of the latter, designed not in the calm atmosphere of the monastery, but in the turmoil of city life? What rest are they likely to find in the work of a man who has hurried from his breakfast to the train which rattles him to the office, where he is greeted by a batch of letters and sundry interviewers, all more or less disturbing, before he can give his attention to design. Even now the ecclesiastical work is, as a rule, better than the domestic, because it is almost always designed under more favourable circumstances. The site is handed over to the architect unfettered by those governing conditions which lead to wrangles over party walls and ancient lights, and the construction remains outside the by-laws and restrictions which shackle the details of the town house, so that he can concentrate all his attention upon the design.

Peace of mind is essential to that restful charm which is so often lacking in modern work. There are experts who will, with considerable accuracy, deduce the character of the writer from the handwriting, and it needs no very subtle power to read from the building the character and temperament of its designer. You may see good sense in the use of the material, clearness of head in the simplicity of the plan, a well-balanced mind in the disposition of the masses, courage in the breadth of the wall spaces, imagination in the treatment of the skyline, wit in the contour of a moulding, and humour in an unexpected piece of carving; or miss some, or all, of these qualities as the case may be.

We speak of an architect being at his best in some examples of his work, and feel a puzzled sense of surprise that, in another case, he fails to give us an equal pleasure; yet the man is the same, his talent as brilliant, only it has been employed under less favourable conditions. Success itself sometimes carries with it a form of Nemesis. The architect is distracted by the excessive demands made on his attention and time; he finds himself unable to give to his later work the careful consideration which won his early success, and his best work is done on the threshold of his career. But if, on the other hand, he, the architect, whether from strength of will or absence of temptation, escape this last disaster, his design, reflecting the firmer purpose and resolve which the lapse of time well spent give to his character, becomes with the advancing years more dignified, more calm. As he grows more self-reliant, he trusts less and less to those quips and conceits which give piquancy to his earlier work, and obtains his effects by a measured peaceful solemnity, becoming to age and mastery.

H. I



SHOP AND OFFICES AT WINDERMERE. T. H. MAWSON AND DAN GIBSON, ARCHITECTS.

What Shall I Study for? The question at the head of this leaderette is one which is sure, sooner or later, to confront an earnest student, and upon the answer given to it depends, to a great extent, his future career. This is particularly the case with the younger man, with his tastes unformed, or at best half formed, and it is to such that advice can best be offered. Even so, the advice must be considered carefully by each individual, that he may apply what are necessarily but general directions to his own special circumstances. Take, for instance, the young man whose relatives have wealth and influence at their command, who is himself artistically inclined, and who is articled to a firm renowned for its good architectural productions. It is natural that such an one should aim at passing the three examinations of the R.I.B.A., and he should sit for the Preliminary at the earliest possible moment, taking the Intermediate and the Final in due course, not hurrying his preparation, but doing it thoroughly; spending what money may be necessary to secure the best instruction possible; travelling, sketch-book in hand, to widen his knowledge, and purchasing at least the nucleus of a first-rate library, both for immediate reading and for reference; all this being done as an investment of time and money which is sure to be well repaid eventually. But, after all, it is the comparative few who are thus circumstanced. A large number more of equally talented men, with equal enthusiasm and intention of succeeding in architectural practice and of producing works of high excellence, have neither means nor time to undergo the long and exacting course of preparation now almost essential for entry to the R.I.B.A. To such the Society of Architects is open, with its one examination well devised and well conducted, which, although quite as severe in itself as the R.I.B.A. Final, does not make such exhausting demands upon the student, there being no testimonies of study to prepare, and only a single examination to pass. Then another large class of students is that to whom the professional rather than the artistic aspect of architectural work appeals. These are likely to become measuring or quantity surveyors rather than architects in the fuller meaning of the term, and for them the Surveyor's Institute has more attractions than either the R.I.B.A., or the S.A. They should enter for the Professional Associates Examination, following it up later on with that for fellowship—in the building section — and their preliminary studies might very well be directed towards the various South Kensington examinations in building construction and geometry. The examinations of the same authorities in architecture and design are much better avoided. Even now a fourth class of students remains to be considered—that of the men who intend to enter the technical branches of the Civil Service. For them the highest preparation possible is essential, and it ought to be directed towards the more severe examinations, such as those for assistant civil engineers in the Admiralty and for assistant surveyors in the Royal Engineers. The fourth page of the daily papers, such as the "Times," "Standard," or "Scotsman," should be watched, on Thursdays only, for announcements, which are made about six weeks in advance, and it will not unfrequently be found that a candidate who has prepared for one of the above-named examinations has made himself fit to compete for something else which happens to be advertised. In all cases, and above all, official particulars of the examination to be entered for should be obtained from headquarters and from nowhere else, and also, where possible, specimens of papers set on previous occasions; and all rules as to the proper mode of filling in application forms, paying fees, &c., must be rigidly adhered to. G. A. T. M.

On Reflection.

Unhealthy Offices. The office is the outcome of the art of writing, the spread of trade, and the congregation of men in towns and cities. In some respects the merchant of those days when the force of brute instinct was feeling the first effects of a growing civilisation was better off than his present-day descendant, for he had the inestimable advantage of breathing in an atmosphere which was unpolluted by soot, and of transacting most of his business in the open air. But though our newest offices cannot, necessarily, reach to the level of their early precursors, it can indeed be said for them that they are a vast improvement on those miserable, dirt-filled apartments with which we are so familiar in the pages of famous novels. But there are still far too many foul, badly-lighted, and evil-smelling, rooms called "offices." To an outsider it would seem the grossest folly for a man to spend the greater part of his waking hours boxed up in a place where the light is bad and the air stuffy; but how many such rooms is the reader not acquainted with? Offices should be as healthy, as free from dust, and as well ventilated as it is possible to make them. It is certainly satisfactory that the modern office is much healthier than the one, for instance, which Dickens describes in his "Christmas Carol," and which, unfortunately, was only one of a prevalent class, and a class whose traces have not yet been obliterated. Principals should make it their aim to see that those who work for them do so under conditions that are not deleterious to their constitutions, or, perhaps, ruinous to their eyesight; and it also behoves all subordinates to see that the rooms provided do not fall into an inhygienic state through the neglect of certain simple requirements which it should be their duty to see complied with daily.

Houses Without Windows. The open-air treatment of consumptives has been given so much prominence latterly that the question has been asked, why, if living in open rooms is good for people of delicate health, it is not even more so for those of sound constitution? In support of this plea it has been urged that, with a greater amount of fresh air, as opposed to living in stuffy and ill-ventilated apartments, the general health would be vastly improved, and a certain "hardness" would be acquired which would be a good safeguard against the many trifling ailments that are to-day so prevalent. As in sanatoria, it is proposed to remove all the window frames and to supply the house with as much air as possible without creating unpleasant draughts, and in considering the idea it is well to remember that "It's indoors, sir, as kills most people." It would certainly be better if we, that is, dwellers in cities more especially, got more fresh air into our lungs nowadays and lived in rooms which did not possess that offensive and oppressive smell which is the result of a silly aversion to the opening of windows and doors. Although we do not think that if the scheme were carried out to any considerable degree, really effective and satisfactory results could be obtained by adapting an ordinary house to the new requirements, yet it is quite feasible to suppose that with specially constructed houses, having corridors and rooms arranged on a definite and scientific basis, much good would obtain. But what would you do? says the outsider. Would you sit in a room which had no windows on a night when the cold wind was whistling around corners and the rain was coming down in one miserable and perpetual downpour? We should think that the most ardent enthusiast for houses without windows would hardly agree to this—with ordinarily constructed houses. But there's the point. Houses can be built and means can be provided to enable persons to live practically in the open air, and yet not experience inconvenience from cold or damp. There are many matters relating to the planning and furnishing of houses which require a good deal of revision, and after a certain time for experience and improvement, this idea of admitting fresh air in larger quantities than is possible by any means of artificial ventilation—for this can never equal natural ventilation—is one which perhaps possesses a great deal more merit than would at first appear to the follower of precedent and the prejudiced enemy of innovation.

Theatre Fires. Following catastrophes in which many lives have been lost there always comes an influx of measures and suggestions for preventing the recurrence of similar disasters, and it is in connection with the three recent theatre fires at St. Helens, Cardiff, and Sheffield that the British Fire Prevention Committee have issued, as one of their publications, a paper by Mr. W. Paul Gerhard, who is the leading authority in the United States in matters of theatre safety. Mention might here be made that the committee itself was the outcome of the deplorable Cripplegate fire two years ago. It is a common supposition that a fireproof building means one built of fireproof materials, but, as Mr. Gerhard points out, a badly-planned theatre might easily prove to be a veritable death-trap in spite of all fireproof construction; good planning is therefore the most important thing of all. It has been found from carefully prepared statistics that theatre fires generally originate on the stage, and it therefore becomes a primary necessity to provide means for effectually shutting off this portion from the auditorium. We feel sure everyone will agree that the arrangement of corridors leading into one another from different parts of the house is to be stringently avoided and every part decentralised as much as practicable. In the paper referred to it is emphasised that, as those in the gallery have the furthest to travel, they should be provided with the greatest facility for exit, though the reverse of this is often the case. As regards the rapidity at which a building can be emptied, it is stated that the 1,500 persons accommodated in the Bayreuth Theatre can leave in just two minutes, while the Gaiety Theatre in Boston (holding 3,000 persons) can be emptied in four minutes. Exit doors for 500 persons or less should be 5ft. wide, and 20in. wider for every additional 100 persons, and they should swing outwards: stairs should be at least 4ft. 6in. wide, and have a landing at the top. Mr. Gerhard advocates external escapes, and particularly mentions that lightning rods should be provided. Efficient watching is, of course, needed, and a periodical inspection of the building. To draw off the smoke, large ventilators should be provided in the stage roof, the doors in the proscenium wall should be of oak, lined on both sides with tin, and automatic sprinklers ought to be included among the fire-extinguishing apparatus. As Mr. Sachs (the chairman of the executive) pointed out at the Amsterdam Fire Congress of 1896, the proper order of preventing fire and panic in theatres was (1) planning; (2) watching; (3) inspection; and (4) construction. The loss of life through fires is so appalling that no effort should be spared to minimise the danger, in which endeavour even the architect of a small house may participate, though necessarily the responsibility which rests on him is trifling when compared with that which devolves on the designer of buildings that are nightly occupied by a large number of human beings.

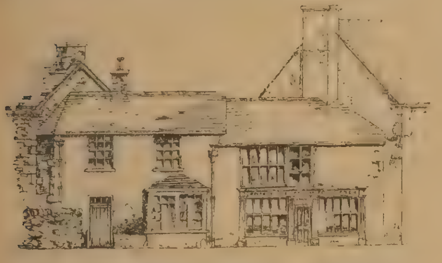
A GARDEN DESIGNER'S HOUSE AND OFFICES.

THE house shown in the accompanying plans and illustrations is erected on an eminence overlooking the whole of the northern portion of Lake Windermere, together with the grand ranges of mountains and numerous surrounding peaks. The site, which is a corner one and of about half an acre in extent, is on the Heathwaite Estate, and is bounded by two roads leading to the villages of Windermere and Bowness.

The house, which was planned to allow of further extension, was designed by Mr. Thomas H. Mawson, in conjunction with Mr. Dan Gibson, the stone being quarried on the site. The chimneys, stabling, and corbelling, and the design generally is in keeping with the older Westmoreland cottages. The panelling in the dining-room is in yellow pine, painted green, above which is a deep stencilled frieze. The limestone head to fireplace is decorated with a conventional treatment of the rose in lead inlay, whilst the firegrate is by the village smith. The furniture and decorations are designed by Mr. Mawson.

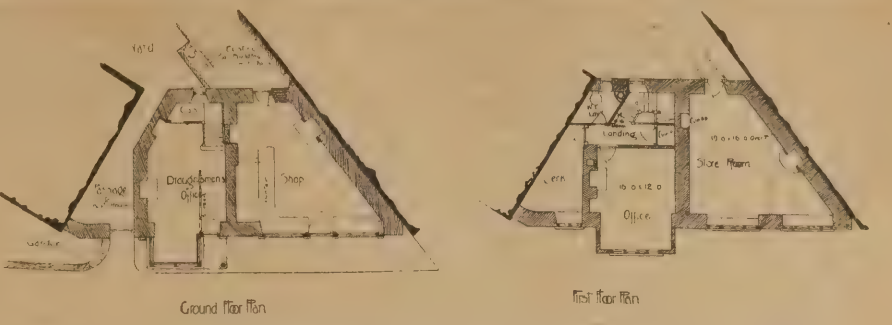
The small garden surrounding the house is quite simple in treatment, breadth and quietness being sought after. It is interesting as belonging to a professional garden designer.

The office was formerly a dwelling house attached to the shop. This portion has been to a large extent rebuilt, whilst the shop has been remodelled, the work being designed by Mr. Dan Gibson and Mr. Mawson. The walls are rough casted and coloured a very light pink, the wood work being painted green. The dressed stonework is of yellow freestone, and the carved brackets to the hood over the shop door are the work of Mr. Arthur Simpson, of Kendal.

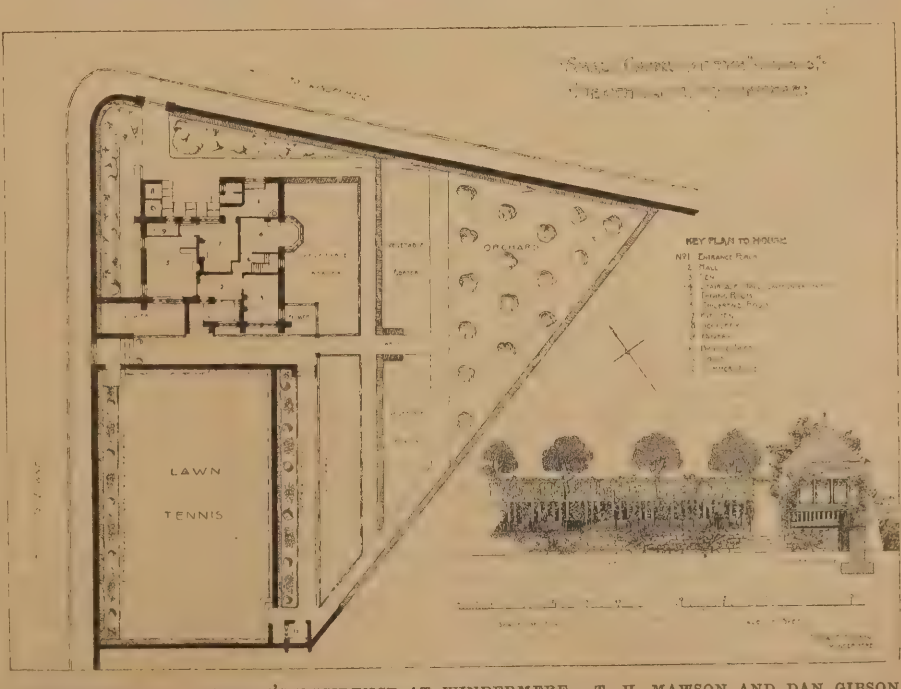


SHOP AND OFFICES BEFORE ALTERATION.

The staircase, which is somewhat unusual in character, has square story posts and newels, carved spads being used instead of turned balustry. The fireplace in the private office has been made by Mr. Pulham to the architect's designs. The settle shown in one of the illustrations is by Mr. Arthur Simpson, who has also made other office furniture.



SHOP AND OFFICES AT WINDERMERE. T. H. MAWSON AND DAN GIBSON, ARCHITECTS.



PLAN OF MR. T. H MAWSON'S RESIDENCE AT WINDERMERE. T. H MAWSON AND DAN GIBSON, ARCHITECTS.

New Church at Enfield.—A handsome new church, dedicated to St. Luke, has been consecrated by the Bishop of London at Enfield. The foundation stone was laid eleven months ago, and the building, of which Mr. James Brooks is the architect, has cost £6,000. It is at present incomplete, only one bay of the nave being built. When finished the new church will accommodate 800 worshippers.

A Rowton House at Hammersmith, W., was opened last week. The area of the site is about an acre and a half. In the construction a million and three-quarter bricks have been used, out of which half a million are glazed to render the work of cleansing more easy. For flooring and other purposes 1,200 tons of Portland cement have been used, and the structure has been strengthened by the employment of 300 tons of steel girder joists. The wood forming the cubicles ran into something like an acre and a half of material, the flooring and paving to two and a half acres, and the piping of various kinds to four miles, while adequate light and air have been secured through the instrumentality of 1,077 windows and 1,158 doors. The architect is Mr. H. B. Measures.

THE LATE LORD LEIGHTON AND THE TATE GALLERY.

SOME HITHERTO UNPUBLISHED LETTERS.

THE Tate Gallery is becoming more and more popular, and as the building has recently received considerable attention by reason of the new extensions (of which we gave particulars last week), it is interesting at this time to refer to certain opinions on architecture in general, and the architecture of the Tate Gallery in particular, expressed by the late Lord Leighton. The building of a new picture gallery was naturally a matter in which the President of the Royal Academy took a keen interest, and on seeing the original design for the building he offered certain criticisms and suggestions to the architect, Mr. Sidney R. J. Smith, through whose courtesy we are now enabled to give the following extracts from the interesting correspondence which ensued.

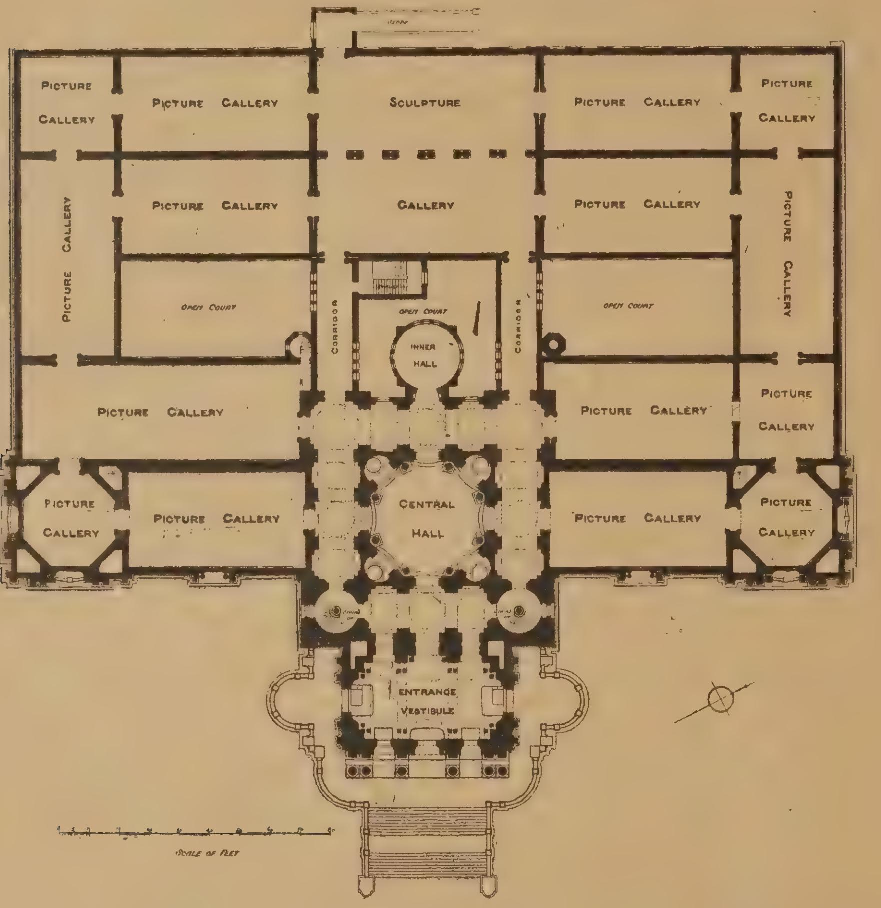
In a letter dated the 7th of May, 1894, Lord Leighton writes:—"I fully appreciate the spirit in which you have taken the criticisms which I ventured to make, on broad and general grounds, on your design for the new British Art Gallery. I may take this opportunity of saying that you were under a wrong impression when you said (on my telling you that I thought that cupolas and turrets were not suited to picture galleries, inasmuch as they were on the one hand *not expressive of* the *purpose of the building*, and on the other hand would cast, however small, considerable shadow over the Exhibition Galleries) that I desired the building to be Greek and not Roman in the character of its architecture. I had no such thought in my mind. With all my profound love and admiration for everything Greek, I should think Greek forms for a London picture gallery in every sense of the word a mistake. (Personally my own inclination would be for some vigorous and free development of Renaissance.) But under all circumstances the first object that an architect should, I think, propose to himself in erecting a building is to make it *expressive of its purpose*, as well as *suited* to it. I have no thought whatever of pressing my advice beyond broad questions of general principle and *fundamental fitness*."

With regard to these ideas of architecture and its treatment in connection with picture galleries, Mr. Smith said in his reply:—"Even if I did not agree with, I should not venture to express any opinion against your's as to 'utilitarianism in art' or 'fitness in building.' But in my original design I cannot but think it looked what it was, a picture gallery—even though it had a 'dome.' You will no doubt remember the Art Palace at Chicago, which was treated in a somewhat similar way (though on rather more Greek lines); also the Amsterdam Galleries, which have towers, and many other buildings for a similar purpose I could name. I need hardly mention the 'sky-lines' of our own National Gallery. I am afraid my drawing of the gallery does not show anything like what is meant by the design and detail. It is extremely difficult (as you know) to make a good drawing of Classic work without great care and finish in the detail, and this in a small sketch is not at all easy."

In Lord Leighton's reply (dated August 3rd, 1896) he says: "I should not revert to the subject of cupolas in connection with picture galleries except to answer what you advance, and that it is very important my meaning should be clear. That domes have occasionally been put upon picture galleries I do not for a moment contest, and, as you very justly say, one need not go further than the present National

Gallery and the schemes which have been promulgated for a new one, to illustrate that fact, but that therefore they have looked, in so far as the domes were concerned at all events, like what a picture gallery should be in *abstract fitness*, is a very different proposition and one to which I cannot accede. I am quite certain that no picture gallery will ever at a future time be built with a dome in France, where the sense of *fitness* is incomparably stronger than with us, or in Germany, where it is not. An edifice with a dome on it is one of the finest forms of building, but the last thing it would suggest to an unbiassed mind is a *casket* for the display of works of art."

Interesting as this correspondence is in itself, it is made doubly so by comparing the design of the Tate Gallery as originally schemed with the one according to which the building was completed. We give a reproduction of each of these designs on one of our inset sheets this week. It will be seen that Lord Leighton's suggestions were eventually adopted, but whether the result was to improve or to spoil the original design is a matter upon which there will doubtless be differences of opinion. The ground plan of the Gallery, with its new rooms, is shown on this page.



GROUND PLAN OF THE NATIONAL GALLERY OF BRITISH ART. SIDNEY R. J. SMITH, ARCHITECT.

Gladstone Memorial at Liverpool.—At the meeting held in Liverpool on Wednesday last (the Lord Mayor presiding), photographs of Mr. Thomas Brock's memorial design were submitted. This design shows a statue, 10ft. high, of Mr. Gladstone in ordinary dress standing on an ornamental pedestal; the total height of the memorial will be 28ft. On two sides of the pedestal are seated figures emblematic of Truth and Justice. On the front is a design in relief indicative of Brotherhood, while the panel on the other side represents Progress. The figures and panels are to be executed in bronze, and the pedestal in grey granite finely dressed. It was announced that upwards of £5,000 had been subscribed towards the memorial, and it was decided to offer Mr. Brock this sum for the execution of the work. The question of the site was not decided.

ELLIPSE BY COMPASSES.*

By R. RAMM.

This article is the result of a discovery by the writer of a simple, practical, and certain system for drawing true ellipses by means of set-square and compasses, or radius rod, an operation hitherto stated to be impossible. The writer was told a few months since by two gentlemen in authority at the Science and Art Department, South Kensington, that it was "quite impossible to do certain things correctly by compasses," the formation of true ellipses being one of the impossibilities. It is not intended here to go into the analytical demonstration of the figure so found, but simply to attempt to show and describe a system by means of which we can construct with confidence and directness true elliptic curves by the compasses upon the given major and minor axes.

This, as will be seen, is quite unlike the ordinary way, in that the method here shown applies to almost every description of the figure, excepting very flat curves, whereas in the ordinary way the points for striking the curves have to be found by a kind of guesswork, and it is in this particular that the difference between the ordinary way and the system under consideration will be appreciated, as here the points are, in almost every case, fixed, and they determine the variety of curve. For instance, the two diameters are given; the construction of the diagram gives at once the exact positions of the points, and the exact lengths of radii that will describe the true curve which shall, if necessary, pass through any number of points previously found in the curve from the foci.

Of course, the ordinary method, for practical purposes in the shop or on the building, is to set out by a trammel. In some cases this is inconvenient; it certainly is so when working upon paper, and if we can make use of a method by which we can describe any or all of these curves truly by either compasses or radius rod, we at once very considerably lessen the labour and vastly increase the pleasure attached to the operation. In regard to the general way of describing the approximate figure by compasses, it may sometimes happen that the curve, when tested, will be somewhere near the truth, but such an approximation is rare and will not be the effect of a direct method but of accident, as the way in which it was brought about would not apply in the next case with the same result.

The mere inspection of the examples here given will be sufficient to show the value of the system, and to explain how to find the true section of a cylinder upon a given oblique cutting plane; to find the true section of a cone upon a given plane, the section of which is an ellipse; to find the angle rib, the true rib being given, of either brackets, coves, or groins by compasses or radius rod.

Some of the diagrams given show the curve tested by points found from the foci, and also by ordinates (see Figs. 8 and 9). In all the constructive lines are drawn, and they, it is hoped, show exactly the working out of the figure. It will be found that the extra point obtained for describing what may be termed the "haunch" of the ellipse is just where it is wanted, as in nearly every case by the old way there is an ugly break at the junction of the two curves or arcs.

Let it be required to find the section of a cylinder upon a given oblique cutting plane. Fig. 1 is the plan, and Fig. 2 the elevation of the cylinder. A *a* is the cutting plane. With radius A *a*, describe the arc *a b*, produce lines from *b* and A of any convenient length at right angles to the vertical axis of the cylinder, and erect a perpendicular at *d*. This line represents the line A *a*, erected and moved to *d*. Take any point in the line *b b*, and drop a perpendicular, E *e*; find the centre, *o*, and describe a circle to touch the lines A *a* and *b b* at the points E *e*. Take radius from plan, Fig. 1, and from *o*, Fig. 3, describe a circle to cut the diameter at the points *g g*. The lines E *e*—*z z* now represent the major axis, and the minor axis of the ellipse moved to *e*, and rotated. With radius of circle *o* E, from *g g* describe arcs cutting the perpendicular E *e*. From *o* describe a circle that shall touch both these arcs at the points *h h*. With set-square, angle 60deg., draw lines from *h h* to cut the perpendicular E *e*, and produce them. At the intersection of these lines with the perpendicular will be found the points whence to strike the portions of the curves at E and *e*. With set-square, angle 30deg., draw lines tangent to the small circle each way as before, and where they cut the lines of 60deg. previously drawn are the points whence to strike the corresponding portions of the figure. From the points *i i*, on the diameter, with radius *i z* and *z i*, describe the arcs *z z*, which will complete the section.

It is required to find the true section of a cone. Fig. 4 is the plan, and Fig. 5 is the elevation of the cone. A *a* is the cutting plane. Bisect A *a* in the point *b*, and through the latter draw C *c* parallel to the base of the cone. From A, with radius A *a*, describe the arc *a d*, and draw lines *d d*, A *a*. Erect the perpendicular E *e*, and from *o*, with radius *b a*, Fig. 5, describe a circle touching *d d* and A *a* at the points E *e* (Fig. 6). Through the centre *o* draw the diameter *g g*, and produce it both ways to cut the circle. To find the minor axis of the ellipse, lay out the line C *c*, Fig. 5, anywhere, as at Fig. 7, bisect it and describe a half circle upon it. Take the distance *c b*, Fig. 5, in the compasses and apply it to the line C *c*, Fig. 7, from *c* to *b*; upon the point *b* raise the perpendicular *b b*; then *b b* is the radius of the circle *o z*, the diameter of which equals the minor axis; the perpendicular E *e* the major axis. The completion of the section is carried out exactly as in the previous section of the cylinder, Fig. 3.

Given the elevation of a rib, to find the elevation of the angle rib that shall intersect at all points with the true rib. The intersecting angle equals 45deg., but may be any given angle. Let Figs. 8 and 10 be the true ribs, &c., Figs. 9 and 11 are the angle ribs, Figs. 8 and 9 show the curve tested by

A NEW METHOD OF DRAWING ELLIPSES. BY R. RAMM.

(All rights reserved.)

points, and also by ordinates. The description of the sections of cylinder and cone apply in the same way to these diagrams, and also to Figs. 12, 13, and 14. The angles of 30deg. and 60 deg. are as conveniently found by rod on the drawing-board as by set-square upon paper. We have only to apply the radius of the small determinating circle from *h h*, as centres, cutting the perpendicular and the circumference of the small circle.

Correspondence.

CIVIL SERVICE APPOINTMENTS.

To the Editor of The Builders' Journal.

London, W.C.

Sir,—Professor Henry Adams has so high a reputation for accuracy, that it is astounding to notice what a mass of faulty information he has contrived to give in his reply to "Anxious" in your issue for Nov. 22. The regulations which he quotes have been, in every single case, superseded for some considerable time! The only right thing to do would have been to refer the querist to the secretary of the Civil Service Commissioners, 68, Victoria Street, S.W., who will supply full, and correct, particulars gratis on application. But even these should be accepted with caution, as every examination syllabus is liable to alteration at any time without notice. "G. R." would also do well to examine the present syllabus before purchasing the books which Professor Adams recommends. Seddon's "Builders' Work," for instance, is now valueless, for the R. E. Surveyors' Exam., and whoever bases his studies on Leaning's "Quantities," does so at grave risk of failure—and this in spite of the excellence of the book; while the "Schedules" are the worst things possible for the purpose of pricing. "Specification" is worth all three books put together, and Stevenson's "Estimating" should be added.—Yours truly,

G. A. T. MIDDLETON.

To the Editor of The Builders' Journal.

London, E.C.

Sir,—Having, through your courtesy, seen the above letter, I would say that the particulars given were the most recent in my possession, and that they are not very materially modified by the later examinations, *e.g.*, although handwriting and spelling are not now taken as separate subjects it would be absurd to suppose they are not duly considered by the examiners. In the last examination for assistant civil engineers, H.M. Admiralty, mineralogy was omitted and sanitary engineering added. In the examination for assistant surveyor in the Works Department of H. M. Admiralty, mensuration, book-keeping, trigonometry, and algebra are omitted from the latest regulations. In the examination for assistant surveyor R.E. Civil Staff the two parts are taken as one, and surveying and levelling are added. In the examination for assistant surveyor, H.M. Office of Works, the two parts are combined, practical geometry and algebra are omitted, and the additions are history of architecture, valuation, and law subjects (arbitrations, fixtures, dilapidations, light, and air). The other subjects practically stand unaltered, although there are slight differences in the wording of the regulations.

I expressly recommended prospective candidates to apply to the Civil Service Commissioners for particulars as soon as any examination is announced, on account of the variation in details which may occur.

I can quite understand Mr. Middleton's objections to any of Col. Seddon's works, but that does not affect my opinion of their value. As to "Qnantities," Fletcher's book is perhaps likely to be more favoured by the examiner than Leaning's, but the latter is, in my opinion, far better and more in accordance with London practice. If a knowledge of quantity surveying derived from Leanings book could possibly lead to failure it would indicate something radically wrong in the examination. Respecting the "Schedules," I would only say that these are the priced items upon which the War Office work is actually carried out. By all means add "Specification" and Stevenson's "Estimating" to the List.

HENRY ADAMS.

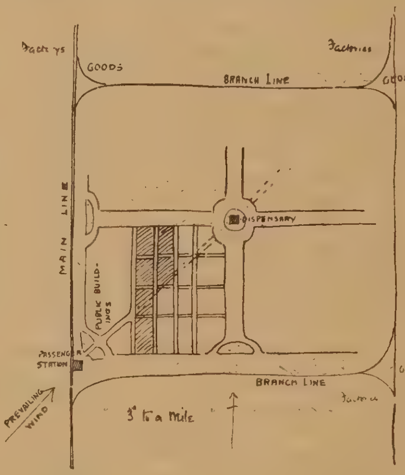
AN IDEAL CITY: MORE SUGGESTIONS FOR ITS PLANNING.

To the Editor of The Builders' Journal.

Bury.

Sir,—Having read with much interest the description of a model city and the very practical criticism on it by Mr. Strange, I should like to submit what to my mind are the essential points to be observed in laying out a town that shall give the maximum amount of convenience with the least objection.

In the first place, there is a great deal to be said in favour of what has been actually done in different localities to suit man's requirements, either in business or pleasure. It will generally be found on examination that certain dispositions of property or streets are the outcome of a natural want. Secondly, the heart of the modern town is the railway. It is our medium of communication with the rest of the world, and ready access to it is the chief consideration with the great majority. A few may prefer their home to be at a distance, but probably they are in a position to provide other means of easy conveyance—I mean in the way of horse or motor traction. A matter which is sometimes lost sight of is that the railway has two uses—passenger traffic and goods. Now the heart of it is the passenger part; the other should be as distinct as possible, consistent with easy access, and should be near the working or factory part, and, therefore, away from the residential district.



SUGGESTED PLAN FOR "GARDEN CITY."

Starting then with the passenger depôt as our nucleus, we begin by grouping round it the more palatial buildings. These would consist of municipal buildings, public assembly rooms, with probably the parish church, hotels, and residential mansions, and should be easily accessible by wide avenues and open spaces, giving proper dignity and distance from which to view them, whilst immediately at the back would be found the larger retail stores. Although the model dwellings for the poorer, or artizan, class, as well as factories and similar buildings, would be the best of their kind and no slums would be allowed to germinate, yet I think we should find that architectural efforts most pleasing to the eye would still be devoted to the edifices just mentioned.

Imagine the stranger on his first visit standing on the threshold of the strange city. What he then beholds will influence his opinion, and will create a prejudice that may be very hard to shake off. I know that on my first visit to Liverpool, viâ Lime Street, I was delighted with the noble group of buildings which I saw, and again at Manchester. Well, Manchester is Market Street and Albert Square. I think that in this way London is greatly handicapped, with all its wealth of buildings. There is not a great central feature to catch the eye and create a great primary impression which will never be forgotten.

Radiating, then, from the station should be wide avenues of as easy a gradient as possible, and, preferably, in three widths, the centre being devoted to that most essential equipment, the electric tramway. At the back of our town should be placed the working part, making it as far as possible to consist of factories, mills, or workshops only. Care should be taken that the winds prevailing should blow on to this district, and also that it should be on the highest part, and not on the lowest. At the back, again, of this should be a branch railway for goods.

I send herewith a sketch which will illustrate my meaning. It will be seen that I have placed the railway passenger station at the S.W. corner on a main line running N. and S. Extensions W. or S. to be residential only. Running from this point are main arteries with a bold crescent or square, having a park or enclosure in the centre. The streets, again, should be formed to run N. and S. It does not follow that the town would be long and narrow on this account, as the gabled streets could be of any length, but would be subordinate, and could give access to back streets, thus keeping the fronts clear of a lot of dirt and refuse.

The factories should be placed at either of the other three corners, and connected to the main railway by loop or branch lines. One advantage of the arrangement given would be the value of the land for its purpose, and as the outlying portion would be cheaper it would suit capitalists wishing to erect works covering a large area.

Although we cannot arrange awnings to cover the entire street in time of wet weather, as suggested in "Looking Backwards," we could go half way and build shelters, leaving spaces for these and enclosures at intervals. A good position for a hospital or dispensary might also be in one of these spaces. We certainly ought to arrange for pneumatic tubes to convey our goods, as well as a culvert to take sewer, gas, and water pipes and electric lighting and telephone mains, &c. I do not think it would be out of the range of possibility to have all smoke flues conveyed to one central main leading to the outskirts.

Mr. Strange is severe on absurd by-laws, and although too great rigidity is to be decried, yet he must surely admit that much good has been done by the adoption of the model ones, if not in their entirety, at least in some of their more salient points. It is the aim of the authorities to control the speculator, who naturally wants to build cheaply, but, alas, not always securely, and the responsible architect is not primarily the object of their application. The fault may be the manner in which by-laws are commonly administered. The surveyor to the urban authority is not an architect, but an engineer, and he does not look at the question from its artistic aspect. His deputy is, perhaps, a bricklayer or joiner by trade, and between them they hamper and oppress with the means at hand the inspired architect in his flights of genius. Possibly with a little bending on both sides the intentions of the Local Government Board would be found to be for the good of the community at large, and therefore to be considered in our ideal city.

Although I have shown a crescent on plan, I might add that these should be used sparingly, and of as large a curve as possible. The Lewes Crescent, at Brighton, is a fine example of what a crescent should be—it is about 700ft. across, but it would be still better if it were 1,000.—Yours faithfully,

B. S.

Dewey Memorial in New York.—The necessary money for the erection of the Dewey memorial arch in permanent form has been pledged, and work on the new structure will begin at once. The total cost will probably amount to about a million dollars. It has not been positively decided yet whether the permanent arch will be erected on the site of the temporary one at Madison Square, or at the Lennox Avenue entrance to Central Park, or elsewhere.

THE PERFORMANCE OF CONTRACTS.*

TO the bewildered student of our chaotic jurisprudence, engaged in "mastering the lawless science of our law—that codeless myriad of precedent—that wilderness of single instances"—Mr. Rawlins' work on "The Specific Performance of Contracts," will come as a boon. Treatises, such as this, are all too rare in our legal literature. Now and then a specimen appears—"Hawkins's Concise Treatise on the Construction of Wills," published in 1863, was one; but it can hardly be said to have had a successor until the book now under review. "A concise text-book which aims at discharging the modest function of a finger-post," to use the language of Mr. Rawlins in his preface, requires for its compilation qualifications that many authors do not possess. The truth is, it is often much easier to write a voluminous dissertation on a legal subject than an essay which, while absolutely trustworthy, is condensed within the narrowest possible compass. To frame definitions which shall be strictly accurate, to enunciate principles in language which is at once brief, unambiguous, and correct, and to make a judicious selection among a multitude of decided cases, needs great learning, wide research, and untiring industry; Mr. Rawlins has accomplished this difficult task with conspicuous success. His epitome will prove an excellent introduction to a work already become classic—that of Sir Edward Fry, to whom it is dedicated, and who, with his usual kindness, has afforded Mr. Rawlins his invaluable assistance in its preparation.

The specific performance of contracts is a subject not devoid of interest for even the non-professional reader. Almost everyone may have occasion at some time or another to enter into a contract, the non-performance of which by the other party will cause disappointment, inconvenience, and loss, for which mere money will afford no adequate compensation. For such wrongs the Common Law of England gave no satisfactory redress. Pecuniary damages constituted practically the only kind of atonement which it provided. A broken head, a broken heart, or a broken covenant alike gave rise to an action which, to use a legal phrase, "sounded in damages." In this respect the law of Scotland was in advance of our own, as it gave, in certain cases, a remedy called "implement," which is, in fact, specific performance under another name. The beneficial action of courts of equity in supplying defects in the Common Law is, perhaps, nowhere better exemplified than in the assumption and exercise of the jurisdiction to compel people to actually carry out the agreements into which they have entered, and to prevent their escaping by merely paying pecuniary damages. These courts were courts of conscience, originally presided over by ecclesiastics, and acted upon broad principles of natural justice. A similar system grew up in Rome, where successive Prætors, by their annual "edicts," gradually established an enlightened code of equity. It is curious to note, however, that the idea of compelling the specific performance of contracts found no place in Roman equity. The Continental systems of jurisprudence have been largely founded on Roman law, and the result has been that, except in Scotland, it is only in places which have derived their ideas from English law—Ireland, certain of our Colonies, and the United States—that this remedy exists. The ecclesiastics who sat as judges seem to have derived their ideas on this subject from the Canon Law, which apparently recognised the principle. Chaucer, in "The Friar's Tale," speaks of—

> An Erchdeken, a man of gret degré,
> That boldely did execucioun
> In punischyng of fornicacioun,
> Of wicchecraft, and eek of bauderye,
> Of diffimcionn, and avoutrie
> Of Chirche-reeve and of testamentes,
> Of contractes, and of lak of sacraments,
> And eek of many another maner cryme.

The jurisdiction, whatever be its origin, can be traced back as far as the reign of Richard II., but the Common Law Courts vigorously opposed its exercise, and so late as the tenth year of James I. the judges of the King's Bench, with the illustrious Lord Coke at their head, stopped by prohibition, in the case of *Bromage* v. *Gennings*, what seems to have been a suit in the Marches of Wales, to enforce specific performance of a covenant to grant a lease. So strong, indeed, was the feeling of Common Law lawyers on the matter, that Serjeant Harris, the respondent's counsel, said that the part he took in the case was against his conscience. Let us hope that he returned his fee!

It is not all contracts, however, of which a Court of Equity will compel the specific performance. At first, this seemed to depend on the discretion of the Chancellor. Mr. Rawlins quotes a well-known passage from Selden's "Table Talk," which shows what was the impression that prevailed in the seventeenth century regarding the fluctuating views of different holders of the seals. We make no apology for reproducing it:—"Equity in law is the same as the spirit in religion, what everyone pleases to make it. Sometimes they go according to conscience, sometimes according to law, sometimes according to the rule of the court. Equity is a roguish thing; for law we have a measure, know what to trust to; Equity is according to the conscience of him that is Chancellor, and as that is larger or narrower, so is Equity. 'Tis all one as if they should make the standard for the measure we call a foot, a Chancellor's foot; what an uncertain measure would this be! This Chancellor has a long foot, another a short foot, a third an indifferent foot. 'Tis the same thing in the Chancellor's conscience."

However well founded these ideas may once have been, they have long since ceased to be even approximately true. Lord Eldon, under whose chancellorship many equitable doctrines attained shape and fixity, denounced them in emphatic language. "Nothing," said he in *Gee* v. *Pritchard*, "would inflict on me greater pain than the recollection that I had done anything to justify the reproach that the equity of this court varies like the Chancellor's foot."

But the long feud between courts of equity and courts of law was finally composed by the Judicature Act, and at the present day equity "walks arm in arm with precedent." The rules of equity are happily now, so to speak, stereotyped; the difficulty lies not so much in stating as in applying them. As regards the enforcement of contracts by a judgment for specific performance, the cases in which that remedy is available are clearly defined. Thus, you cannot compel the specific performance of a contract for the sale of an article of ordinary commerce, such as wheat or wool, but you can do so in the case of a contract for the sale of a house or an estate. The reason is not far to seek. In the former case you can go into the market yourself, and buy the same quantity of the article, and if you have to pay more for it, recover the difference, and, in some instances, other consequential loss, as damages. Pecuniary damages therefore afford sufficient redress. But not so in the latter case. You cannot, or at any rate, may not, find a house or an estate exactly similar to that which you bargained for, and pecuniary damages, therefore, would not place you in the same position as you would have occupied if the sale had been actually carried out. This is the reason why you cannot obtain special performance of a contract for the sale of Government stock, or any other security which is commonly sold in the open market, but can compel the delivery of those securities which, like the shares of many joint stock companies, are not always to be had at a price.

Mr. Rawlins gives an exhaustive list of the cases in which specific performance will be refused. The most important class of these is, perhaps, that in which the contract is in its nature strictly personal, as where it relates to personal services to be rendered by one of the contracting parties. You cannot obtain the specific performance of a contract to serve as an assistant in business, or to enter into partnership, any more than of a contract to marry. Closely connected with this class of cases is another in which the readers of the Builders' Journal are more immediately interested—namely, those for the erection of houses, the working of mines, the construction of railways, and others involving a continuous series of acts. Specific performance of such contracts cannot be enforced, the reason being that the court would be unable to superintend or enforce effectually the execution of its judgment. There is another case in which, curiously enough, specific performance cannot be obtained—namely, where the contract is for the loan of money. In that case, neither party can enforce it in this way, except that if it be already advanced, the borrower can be made to execute the mortgage or other security agreed on.

For the grounds of defence to an action for specific performance we must refer our readers to the work itself, mentioning only one—namely, misrepresentation made by the party seeking to enforce the contract, in order to induce the other party to enter into it. On this point Mr. Rawlins quotes a passage from a judgment of Mr. Justice North, which embodies the law on the subject: "It is quite true that a man may with impunity tell a lie in gross in the course of negotiations for a contract; but he cannot, in my opinion, tell a lie appurtenant. That is to say, if he tells a lie relating to any part of the contract or its subject matter, which induces another person to contract to deal with his property in a way in which he would not do if he knew the truth, the man who tells the lie cannot enforce the contract." Arthur Houston, Q.C.

Views and Reviews.

THE PROCESS YEAR BOOK.

The subject matter of this annual is apparent from the title, but the scope of the work is more particularly a review of the graphic arts. We may deplore the non-decorative get-up of modern books and periodicals, but as this in the majority of cases is influenced by commercialism, we feel that the system has come to stay. The introduction of thin types in place of the old black-letter ones at once threw the wood-cuts out of relation; then these latter became photographic in nature, marking a still further degradation of decorative aspect in books; and finally we have the photo-mechanical processes, which have now practically banished the wood-cut. William Morris and his followers have done considerable good in reminding us that modern printed works are not decorative and in showing us by what means they can be made so, but the illustrative artist cannot do without some slight knowledge of the processes now in use for illustration. We know of no better work to provide the knowledge than this annual. The book contains a very large number of illustrations in all the usual processes of reproduction, and contains an immense amount of information, but this is conveyed in articles written by experts who have a rather exaggerated view of their particular subject, and reminding one of the cobbler's remark: "There is nothing like leather." It would be well in future numbers, we think, if the Editor gave more hints upon the true value of the various processes of reproduction. Photography in colour and reproduction by the half-tone colour process occupies rather too prominent a place in the book for the general reader, for we consider it will have to make large strides before it can be extensively adopted in place of colour collotypy, photogravure or lithography. The annual is most carefully printed on glossy paper, and shows modern work at its best.

"Penrose's Pictorial Annual: The Process Year Book for 1899." Penrose and Co., 8 and 8A, Upper Baker-street, Lloyd-square, W.C.

DISCHARGES AND VELOCITIES OF SEWERS.

This small book contains a series of diagrams designed from calculations based on Weisbach's well-known formula, and dealing with discharges up to 300 cubic feet per second, equivalent to over 161,600,000 gallons in twenty-four hours, together with velocities up to 15ft. per second. The diagrams are intended to facilitate the determination of information on various matters connected with the flow of liquids in sewers and conduits, and to some extent meet the need which engineers engaged in designing sewerage schemes now experience, for an expeditious method of obtaining the discharges and velocities of sewers and water conduits of various sizes, laid at different gradients, and when sewage is flowing in them at various depths. The information has been put in diagrammatic, in preference to tabular, form, first on account of the smaller liability in the former case to serious mistakes by reason of clerical and other similar errors, which, if of moment, generally make their presence conspicuous on a diagram; and, secondly, because, on account of their greater compactness and completeness, the diagrams forming a series may be read in conjunction with one another with greater facility than tables. Mr. Newton has succeeded in producing a very valuable work in thus lightening the labour and time expended on one department of engineering.

"Diagrams exhibiting the Discharges and Velocities of Circular and Oval Sewers, and Water Conduits, together with Notes on the design of Sewerage Schemes." By Edwin B. Newton, F.S.I., A.M.I.C.E. London: St. Bride's Press, Ltd. Price 2s. 6d. nett.

ELECTRIC WIRING.

Although there is no lack of popular guides to electric lighting, mostly published at 1s., and full of cuts taken from manufacturer's catalogues, on the one hand, and of abstruse and highly mathematical "elementary" treatises on the theory of electricity on the other hand, yet there are very few books that deal in a practical manner with the appliances needed in electric lighting. The book under notice attempts partially to fill the gap, and in a measure succeeds. Students, especially those preparing for the Preliminary and Ordinary Grade examinations in electric lighting conducted by the City and Guilds of London Institute, may be recommended with confidence to the book, while to a more limited extent architects and builders will find it useful. The three chapters into which the work is divided deal principally with lamps, both glow and arc, switches, and systems of wiring. As a commencement the book gives a short account of the manufacture of incandescent or glow lamps, including notes on the preparation of cotton for filaments, the carbonisation of the cellulose wire, mounting the filaments, flashing, sealing, exhausting the lamp bulbs, and testing. Necessarily not much more than an outline of each of the processes is given, but it is to be regretted that no reference was made for the benefit of the student to a work giving fuller information, such, for instance, as Ram's "Incandescent Lamp." This, indeed, is one of the shortcomings of the book, the reader being shunted—to use an appropriate term—to the author's other elementary manuals, rather than to a handbook written by a specialist, for further information on matters that cannot be completely considered in the book under discussion.

After the account of the manufacture of incandescent lamps, descriptions are given of several forms of lamp-holders and switch lamp-holders, the reader in this way becoming initiated into the mysteries of B.C. (bottom contact), etc., E.S. (Edison screw), and other initial letters to which the electrical engineer is so extremely partial. Forms of glow lamps, their shades, &c., are illustrated and mentioned, and a short discussion on the efficiencies of the lamps and the method of connecting them to the mains completes this section. It is interesting to note, simply by the way, the failure of the attempt to use "incandescence" as the adjective rather than "incandescent"; nowhere in the book, as far as we have seen, is the first employed.

In connection with the power efficiency of glow lamps, we are glad to note that the author allows ordinary lamps about 3·75 watts per candle, many writers on the subject unjustifiably assuming higher efficiencies as average values. The remainder of the first chapter describes the action of ten different types of arc lamps and their accessories, and, miracle among such works, the book describes only one form that is obsolete. This portion of the book is perhaps the most valuable, useful line drawings being given of most of the lamps, so that the mechanism can be clearly understood. Four of the modern enclosed arc lamps are treated, including the Jandus, Stewart, Davy, and Lewis lamps. The second chapter contains descriptions of many forms of switches, fuses, wall sockets, earthing devices, lightning arresters, &c. The information given is in many cases little more than a description of a trade block, and not much that is quantitative appears, nothing, for instance, being said as to areas of rubbing surfaces in switches, carrying capacities of different metals, distance between parts at opposite poles, &c. This robs the book of value it might have possessed for the electrical designer. The third chapter can be commended to the notice of architects, as, in addition to other matter, it contains good descriptions of the following systems of wiring: Bathurst's armoured insulating tube system; Waterhouse's and other plain tube systems; the National Electric Wiring Co.'s lead-sheathed system; Andrews', and Mavor and Coulson's concentric systems; and, finally, the wood-casing system, if so it can be called. Some practical directions on jointing wires, a few simple notes on electrical and other units, &c., and a reprint of the wiring rules of the Institution of Electrical Engineers complete the book. The illustrations number 360, but a very large proportion have already been used in catalogues, and are therefore only more or less appropriate; those that have been specially drawn are, however, specially helpful. The book is descriptive rather than critical and is written in a plain style, the accounts and explanations being simple, and, in some cases, even artless.

"Electric Wiring, Fittings, Switches, and Lamps." By W. Perren Maycock. Price, 6s. London: Whittaker and Co.

MODEL BY-LAWS.

To all concerned in questions of building and sanitation throughout the country, the subject of the present work is of extreme importance. Messrs. Mackenzie and Handford have attempted a laborious task; and the two substantial volumes before us bear witness that they have accomplished it in a creditable manner. The work is necessarily on similar lines to the well-known "Annotated Model By-Laws" of Messrs. Knight and Co.; but it contains additional matter, much of which is original, and it seems to have been brought thoroughly up-to-date. The model by-laws and regulations of the Local Government Board are interspersed throughout with explanatory comments, in which collated reports of legal decisions bearing upon the various questions discussed are embodied, being conveniently arranged for ready reference. Not content with this, the editors have suggested alternative forms of by-laws, adapted to the varying conditions of different localities, and numerous regulations relating to building, sanitary, and other matters that come within the general scope of the Public Health Acts and kindred Acts of Parliament. Several matters of detail are illustrated with the aid of appropriate diagrams, which, we should imagine, will prove to be of practical utility to those for whom the work seems principally intended—that is, to local bodies engaged in drawing up their own by-laws and regulations. As a work of reference, also, it will be found almost indispensable to surveyors acting under municipal or local authorities, and one which architects and builders may frequently consult with advantage. It bears evidence of considerable knowledge and experience and a general acquaintance with the practical needs of various localities; and the editors acknowledge the assistance which they have received in the form of suggestions from Messrs. R. Bruce Low, M.D., and C. Shaw Bond, M.B., M.R.C.S., D.P.H., on sanitary questions, and from Mr. Brook Taylor Kitchin, on questions relating to architecture.

Among so much that is excellent, it is not surprising that there should be found here and there a statement to which exception may be taken, or an instance where fuller information might have been imparted. Thus, for example, it is certainly an error to suppose, as stated at page 88 in the first volume, that it was held in *Drury* v. *Army and Navy Auxiliary Co-operative Supply Company, Limited*, that a wall was only a party wall in so far as it divided "one building from another." On the next page, "*Western*" v. *Arnold* is obviously a misprint for "*Weston*." At page 110 the usual proportions in the composition of lime mortar and cement mortar are specified, but at page 117 no suggestion is offered upon the composition of concrete, which is a matter about which mistakes are more likely to occur. At page 110 reference is made to the practice, sometimes advocated, of grouting walls at every course. "There are serious practical objections," it is remarked, "to this requirement, which, moreover, would be very difficult to enforce. At best the 'grout' only effects what should be, and, with very little additional trouble, may be done with 'mortar.'" There lies the point. If we could always depend upon the ideal bricklayer being employed, we could be certain that the "very little additional trouble" would be taken; but as this, alas, is not the case, it may be as well to require brickwork to be grouted, especially as the most serious objections to it have been obviated since the practice of building-in wood bricks and bond timbers was abandoned. The suggestion made at page 117 that basements should be kept dry by means of hollow walls will commend itself to most persons. Many, however, would prefer to have the greater thickness of wall on the inside instead of on the outside, as shown in Plate III., Fig. 9. By the former arrangement the main portion of the wall is kept dry, and adequate support is provided where it is wanted for the floor timbers above.

The suggestion made at page 179 for providing an outlet to the external air, in addition to a window, for the ventilation of an indoor w.c., is to be commended, but we fear that it would be of little efficacy unless some special means of extraction were provided. Too often the admission of cold air has the effect of driving the foul air of a closet into the house. Where possible, it is better to provide a well-ventilated lobby between the closet and the rest of the house.

In the second volume thirteen original supplementary series of by-laws and regulations are given, most of which seem useful and desirable. In some of them the scantlings for timbers of roofs and floors are prescribed. It must surely be through an oversight that, at page 19, the beams and girders in ordinary floors are directed to be laid 10ft. apart, seeing that provision is made for floor joists for bearings up to 23ft. The scantlings prescribed do not err on the side of extravagance, and we would suggest that in some instances more latitude should be allowed. Why, for example, should not a builder have the option of using 9in. by 2in. instead of 7in. by 3in. for a bearing of 15ft.? The objection to thick floor joists is that their shrinkage is often sufficiently appreciable to cause cracks in the ceiling under them. Such little points as those to which we have drawn attention might perhaps be revised in a future edition, to which it seems likely the work under notice may attain.

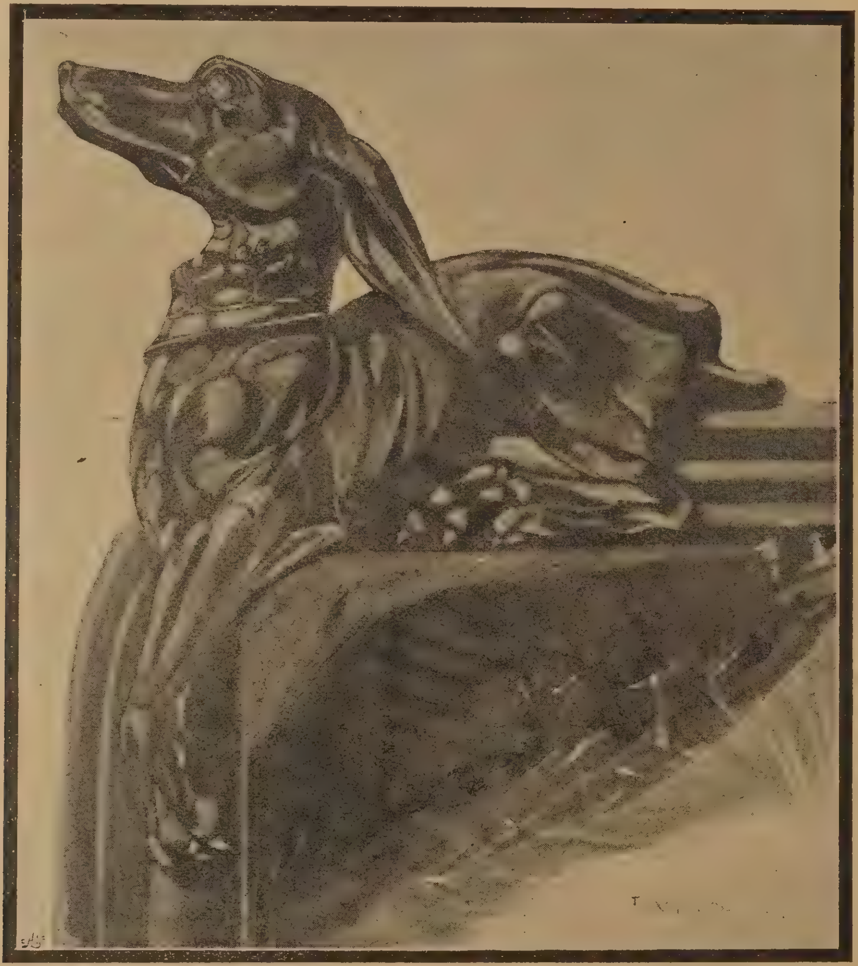
FIRST DESIGN FOR THE NATIONAL GALLERY OF BRITISH ART. Sidney R. J. Smith, F.R.I.B.A., Architect.

THE HOUSES OF PARLIAMENT: BY PAUL WATERHOUSE: WITH ILLUSTRATIONS OF PUGIN'S WORK BY PATTEN WILSON.

* * * *

An architect should be an *ἀρχιτέκτων*, a master workman, not a *παντέκτων*, which—if there be such a word—means a jack-of-all-trades. Here we have dangerous ground of course, and a theory which, however sound in itself, will serve to bolster up the iniquity of the man who cannot draw a stroke, but who can sweat half-a-dozen clever draughtsmen. The impropriety of this misapplication of the theory does not upset its truth, and the Houses of Parliament remain an example of what can be done in real art by a co-operation of workers under an able and modest head. I am quite aware of the controversy as to the authorship of the building which broke out after the death of the two great men concerned. That controversy was wholly unnecessary, but has mercifully detracted little from the dignified renown of the dead heroes, on whose supposed behalf the war was waged. Neither Sir Charles Barry nor Augustus Welby Pugin would, I think, have wished to see the other's claim obliterated or even challenged. The laborious and modest Pugin cared little for personal renown so long as good work was done and he had a hand in the doing of it; and Barry, while he lived, paid more than one tribute to the able assistance of his coadjutor.



CARVED FIGURE ON SEAT END ON RIGHT OF DOOR: BY P. WILSON.

The above is extracted from an article, Part I. of which appears in the Architectural Review for December. This number is one of the best that has been yet produced, and is one of the most attractive of the Art Annuals that appear at this season. There are many other articles of interest to the Architectural Profession. "From Holborn to the Strand: An Ideal Street" is the title of a suggestive article by Mervyn Macartney, and illustrated by plans of the proposed London improvement. "Nôtre Dame la Grande, Poitiers," is an article written and fully illustrated by T. M. Rooke, which is a guarantee of its attractiveness. There are several other equally instructive articles. Being an Art Annual there are several special plates in this number. There is a coloured supplement entitled "A Spanish Garden," from the original painting by A. T. Griffith, and there are full-page plates: "Bridgnorth," from a lithograph by Oliver Hall; "Jerusalem from the Hill of Evil Counsel," from the original painting by T. R. Spence; and a two-page plate of "Nôtre Dame la Grande, Poitiers." The whole is a most attractive number. The price is only one shilling, and copies may be had from the offices, Effingham House, Arundel Street, Strand, or from any bookseller.

Under Discussion.

THE ORIGIN OF THE ARCH.

At the fourth ordinary meeting of the People's Palace Architectural Society, held recently, Mr. Francis R. Taylor in the chair, Mr. Warrow read a paper on "The Origin of the Arch." The principle of the arch as a constructive medium for spanning openings was known by the ancient nations many centuries before the Christian era. In Egypt, India, Persia, Assyria and Greece there were remains of buildings and other indications to show that the arch was known. In all the countries it was originally used as a constructive and not an architectural feature. In the Pyramids two methods were employed for spanning the openings, which undoubtedly showed that the Egyptians were aware of the principle of the arch. In the ascending gallery to the King's Chamber the roof was formed by allowing every succeeding course of stone to project a little beyond the course below until one large stone at the top closed the opening. Other examples of the arch were to be found all over Egypt, notably at the Pyramids of Thebes, which were roofed in by brick and stone arches of semi-circular form. The next appearance of the arch was in Assyria, about the eighth century B.C. These were, however, a considerable improvement on the Egyptian form of arch, one of the best examples being at the city gates of Korshabad. The Greeks were not ignorant of the principle of the arch, but their forms were very crude and infrequent, the best examples being at the Treasury of Atreus at Mycenae, and the gateway at Assos. It was in Tuscany, however, that the arch began to be used, and the Etruscans were the first people who appeared to have understood it. The Roman period of architecture followed closely on the Tuscan, and the arch was now first used as a decorative feature, one of the best examples being the Pantheon at Rome, which had a diameter of 145ft. and was surmounted by one large dome of arch construction. From the semi-circular arch of the Roman period it was not a great step to the pointed arch, resulting in the magnificent building of the Gothic period. A number of lantern slides illustrative of the above paper were shown.

FOR AND AGAINST THE R.I.B.A.

A debate upon the question, "Is the existence of the R.I.B.A. justified?" took place at a recent meeting of the Edinburgh Architectural Society.

Mr. J. A. Williamson, A.R.I.B.A., in opening the question for the affirmative, gave a sketch of the history of the Institute. It was founded in 1834, chartered in 1837, and a medal had been struck in 1846. The membership had increased by leaps and bounds, and now contained 618 Fellows, 290 of whom were from the metropolis, and 328 from the provinces. These figures proved that the Institute could no longer be reproached with being purely metropolitan. The Institute had been consulted several times by the Government, and it had opposed all Registration Bills brought forward by other bodies, but had otherwise encouraged the education of architects. With regard to registration, Mr. Williamson thought that the opinion of the Institute was deserving of respect. Registration would be difficult to carry into legislation. At the start it would be necessary to register good and bad architects alike. Then, was it possible to examine a man as to his artistic abilities? Even eminent architects had been occasionally condemned for their bad taste.

Mr. A. R. Scott introduced the negative side of the debate. He considered that the success of the Institute was due, not to the amount of good it had done to the architectural profession, but to its business-like qualities. All the prominent members were thorough business men, who accepted office possibly on account of the advertisement which such positions afforded. The object of the Institute in opposing registration bills brought forward by other societies was to secure for itself the management of examinations on behalf of the Government. Any man could cram sufficiently to pass the R.I.B.A. in one year, and forget all he had learnt in the same time. Many eminent architects did not ally themselves with the Institute.

Mr. Nobbs, in supporting Mr. Williamson, said that the Institute had been the guide and guardian of the profession. Of all the professions, that of architecture was held in least repute by the public, on account of its being uncertificated. No certificate being required, the architectural profession was adopted by those who had failed in other professions. The examinations of the R.I.B.A. acted as a weeding machine, its only drawback being that its field was limited.

Mr. Gildard seconded the negative side of the question. The provincial members, he thought, received little or no benefit from the Institute examination.

GLASGOW BUILDING REGULATIONS.

These regulations were the subject of discussion at the meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held on Friday, November 24th. Mr. R. W. Horn, A.R.I.B.A., who led the opening remarks, gave a summarised statement of the progress of building in Glasgow, and the consequent necessity for new laws and regulations. The first Bills passed, namely, the "Police Acts" of 1862 and 1866, while being good in their small way, gave the authorities little power, and were entirely lacking in detail. This was remedied by the Bill of 1892, and will be brought nearer perfection by the new Bill of 1900, of which a draft copy was shown. After mentioning the method of preparing plans and petitions of proposed work for submitting to the Dean of Guild Court, and their subsequent revision by the Master of Works and the Guild Liners, he criticised the present regulations and the proposed new ones, mentioning points in which they failed, and making suggestions as to remedies. A useful discussion followed.

EDINBURGH ARCHITECTURAL ASSOCIATION.

The opening meeting of the forty-second session of the Edinburgh Architectural Association was held on November 29th in the Royal Institution, Princes Street, Mr. James Bruce, the president, in the chair. In the course of his presidential address, Mr. Bruce touched on the great change that had taken place within a few years in the character of the structures with which architects had to deal. With regard to architects, he thought their association should try to secure that they were well equipped both theoretically and practically for the duties devolving upon them; that their rights were duly recognised, and their responsibilities not unduly stretched. Regarding their work, he thought their endeavour should be that buildings should primarily be safe in themselves, and suitable in design for the purpose for which they were intended, that they should possess individuality, be harmonious and in keeping with their surroundings, and have in as high a degree as possible beauty of form. To those aims he would add another—that their Association should take all means in its power to see that our venerable historic buildings were respectfully cared for, that restorations, when made, were real restorations and not destructions, and that accurate delineations were made of the outline and detail of buildings that constituted the rich architectural heritage that had come down to us from days gone by. On the subject of the equipment of architects, he said they should try to make it imperative that they should possess knowledge of the laws of construction, and that they should have a good grasp of architecture in its historical aspect. At present that equipment was acquired as apprentices and assistants, and they had the school of Applied Art and the Heriot-Watt College. In the University there was a Chair of Engineering and a Chair of Fine Art, but it did seem to him desirable that among the other Chairs in their University for specific teaching they should have a Chair of Architecture. Looking to the wide interest of the subject and its vast importance to the comfort and well-being of the people, it was surprising that their University did not already possess such a Chair. As to their rights and responsibilities, architecture was an art as well as a profession, but still he thought they might with advantage encourage steps towards meeting those in Scotland who practice architecture as a profession in some recognised corporate body. At present, he understood, anyone without the slightest test of qualification might call himself an architect, and be in a position to practice as such. In this matter he thought the public were entitled to be protected. That could be done by architects being required to pass certain tests, and that they had done so could be guaranteed by their membership of some recognised body. Mr. Bruce enlarged on the other aims of the association, referring, among other matters, to the action of successive Governments in their ill-treatment of our old historic national buildings. At the close the president was warmly thanked for his paper.

CHURCH FURNITURE.

When it is remembered what diversity of opinion exists with regard to the proper method of church worship and of religious ceremonies, it is not surprising that, at the debate last Friday evening of the Discussion Section of the Architectural Association, held in their rooms at 56, Great Marlborough Street, W., rules governing the proportions and details of such furniture were laid down by some, and not accepted by others. Mr. Bonner Hopkins presided. At the outset of his paper, Mr. F. C. Eden pointed out how a gas bracket or a hot-water pipe might mar the interior of a church, and the architect could, therefore, not be too particular about the furnishings. Besides being a designer he ought to have a smattering of certain liturgical rules and requirements and ecclesiological traditions, which would better fit him for the work he had undertaken, and prevent any incongruities creeping into the design. No walls looked better for the inside of a church than whitewashed ones, and it was a pity that this was not considered more in connection with the average suburban church, which frequently exhibited many common and vulgar errors that had appeared since the Gothic revival. When funds were small, it should be the architect's aim to have few things and good, rather than many and cheap, and he ought, in this respect, to be able to distinguish between essentials and non-essentials. Assuming that there was a lack of funds, the best order in which to obtain the principal church furnishings was—first, the altar, then the screen, then the pulpit, then the reredos, and lastly the lectern.

Severity should be the note of altar design, for it was too solemn a thing to be trifled with, and stone should be the material employed. The high altar of a parish church should not be less than 8ft. long, and in considering the height of altars it should not be forgotten that they were meant to be accessible without bending or stretching; the modern tendency was to make them too low. After describing the vestments of the altar, Mr. Eden mentioned that the altar end-posts were the survival of the old (and now obsolete) canopy, while the curtains were the relics of the veil which was formerly used to cover the altar at certain times. As regards candles, these should be of wax throughout, and not half dummy; generally, they were much too long. Unless it was possible to spend a great deal of money on the frontal, it was better that this should be of good plain material, and it was well to avoid having a large central and isolated design worked on it.

The reredos might be of stone, though wood itself was admirable, but as it was an accessory and not an adjunct there was no excuse for cheapness in its construction; in fact, it should be particularly remembered that whatever work was done in connection with a church should be good. The triptych, he thought, was perhaps the noblest form of reredos. Flowers and candles formed no part of altar decoration (they were introduced by certain French nuns) and were not needed; neither was a screen an essential, though it was desirable to have one. Care should be taken to see that the altar rails were not placed on the step above the kneeling step, as this was inconvenient. With regard to the chancel, the rage for large surpliced choirs had played havoc with this part of the church, which ought not to be crowded with stalls, while the organ was, as a rule, far too large, a feature that caused detriment to the power of the instrument and to the beauty of the building. Three matters relating to the organ which should be left for the architect to decide were, its size, its position and its case. In the majority of instances the west choir was the best place for it. On no account should the pipes be decorated.

Pews, broadly speaking, were not essentials to the congregation, and in the Prayer Book there was no mention of their being provided, except one for the Bishop. Seating accommodation ought to be provided for the average, and not for an extra congregation; alleys should be wide, and fixed benches should not be introduced unless there was enough money to obtain those of good workmanship and material. Chairs were, perhaps, the most convenient, but they should not be fastened together, as by this means they had the disadvantages of both chairs and benches without the advantage of either. The pulpit was best not placed against the chancel screen, but a good position for it was well up the nave, an arrangement which enabled everyone to hear the preacher. Wood was a better material to use than stone, and a sounding-board was usually an advantage. The font, in England, was never placed in a baptistery or special chapel, and it was essential that it should have a cover, whether it was a plain one or an elaborate one 20ft. high. In concluding, Mr. Eden remarked that the subject of church furniture was a large one, and in compressing it he had been obliged to leave out certain matters—such as lighting—and to state as facts and rigid principles things which were indeed controversial.

Mr. W. Millard thought a "smattering" of ecclesiological and liturgical matters was insufficient for the designer of church furniture, who ought to have a deep knowledge, guided with, what was most important, a proportion of common-sense, which was more than knowledge. He quite agreed that whitewash was admirable for church interiors, and, as a contrast, mentioned how the plaster had been removed at St. Margaret's, Westminster, and the joints of the brickwork emphasised most objectionably with black mortar.

Mr. Rose was of opinion that it was good that so much attention was given to detail, and thought that the hymn-board with the Oxford frame was very undesirable. The seats, said Mr. Lucas, might be painted a very dark green or red, and the height of the pulpit should be such that the preacher's feet were on a level with the tops of the pews. Doors should be fitted to the screen to carry out the original idea of keeping persons out of the portion adjacent to the altar. Mr. C. H. Brodie objected to movable chairs as they made a great noise, while Mr. L. S. Crosbie thought the idea of the screen was not to shut people out, but to give an air of mystery, and said that by placing the pulpit up the nave many of the congregation would require to turn round in their seats in order to see the preacher. One thing which Mr. G. H. Smith felt sure the architect ought not to forget was the poor man's box, an article often of miserable design.

Mr. G. H. Fellowes-Prynne (who was present as a special visitor) said that there was much fashion in the matter of church furniture, and he asked why there was so little feeling in the work of the present time, considering that the men of past days produced work which was full of meaning and spirit. We ought especially to throw ourselves thoroughly into our work. While he did not for a moment wish that the plaster on our old churches should be removed, he thought that plain plaster was not desirable, as a church needed a good deal of colour. The size of the altar, in his opinion, depended on the size of the church, and he did not think it wise to lay down hard and fast rules by which everything should be regulated. A constructional altar looked better than a dressed altar. Objection had been made to a brick interior. The brick in itself, if it were a good brick, was not objectionable, and, as regards flowers, these had been employed from the earliest times, and, in his opinion, were desirable.

CRAFT GUILDS.

A SUGGESTION FOR THEIR REVIVAL.

LAST Thursday night in the New Gallery, Regent-street, W., Mr. T. J. Cobden-Sanderson, honorary secretary of the Arts and Crafts' Exhibition Society, delivered a lecture on "Craft Guilds." He said the movement associated with the Arts and Crafts Exhibition had had the effect of liberating the craftsman from the obscurity in which he worked and of associating his name with the work he did. It was one of the primary objects of the Society to publish the names of the designers and responsible executants of work exhibited at the Exhibition. Many and considerable difficulties had been experienced in endeavouring to achieve this. Sometimes so many executants had been engaged on a work that to give the names of all would be confusing. Some fear had been expressed that the publication of names would lead to disaffection in the workshops, and although the objection had been raised, the present exhibition did not show any tendency to weakening from this cause. The committee had found it difficult to insist upon firms giving the names of workmen when they objected to do so on the ground that this would lead to their losing a good workman or designer who had been trained in their workshops through another firm offering higher pay. The present state of affairs was tracable to the detachment of the designer from the workshop. The lecturer was of the opinion that if a designer obtained a certain price from the public, that was the price he should be paid, and it was but fair that the employer should make every effort to retain his services by paying him his value. To militate against the present system by bringing the designer and the craftsman together was one of the aims of the Society. The question suggested itself: what movement could be taken to bind the workmen into one fraternity? To properly answer this question it was necessary for him to deal with the Craft Guilds of the past and consider the possible application of their principles to present-day conditions.

The first stage in artistic production was that simple age when every man supplied himself or his family with all things required. In the next stage more was produced than for the actual needs of the person; Trade became established, and with that trade Craft Guilds of merchants were formed to obtain privileges of monopoly over the trade of towns. If a trader was prosperous he became a member of the guild, and if he obstinately refused to join, when in a position to do so, he was compelled. The guilds entered, in a great part, into every-day life, and the funds were applied to relieving distress among sick brothers, relieving poverty, &c. About the time of the formation of the first merchant guild in 1093, the number of towns in England was about eighty; most of these we should now consider merely large villages. The total town population of that time has been estimated at 150,000 persons. The origin of the guild idea was immersed in obscurity, some suggesting that it arose gradually from families of craftsmen, but the lecturer thought, from their coming into existence abruptly, that whenever it was found that an association would be advantageous, a guild was formed.

From the twelfth to the fourteenth centuries the Craft Guilds, consisting of artisans, were formed, as apart from the merchant guilds. Whenever, as in the case of England, a country subsisted on other countries, dealers in raw produce would appear; thus the guild of merchants would naturally precede those of craftsmen. The town authorities appeared to have a real authority over the guilds, notwithstanding the almost absolute authority these often exercised over their members. The laws of the guilds appeared to have been passed as a matter of course by the magistrates of the town to which they belonged. These guilds formed part of the administrative system, as was evident where some of the guilds were brought into existence late, simply to enable the authorities to control them, allowing them no judicial authority at all. The regulations drawn up by the craft guilds aimed, by punishment by fines, at prevention of fraud in the selling of work. In addition to the regulations as to manufacture, there were ordinances upon brotherly love, festivities, and common worship.

Capital played a very small part at this time; there was no social gulf between employer and servant, who worked side by side. The craftsman was independent in a different sense from ours. He generally bought his own goods and acted as his own salesman; combining the functions of trader with manufacturer. Members of each craft usually lived in the same street or district, rendering the work of supervision comparatively easy.

In the fourteenth century the guild system reached its greatest efficiency, but in the sixteenth century the influence of foreign trade broke it down. The death of the institution was due to the inevitable expansion of trade and of thought, as well as of manufacture, which rendered control by local jurisdiction impossible, and the Government had to usurp more and more the place of the guilds. Some of the guilds which modified themselves to secular purposes managed to survive as benevolent institutions.

Mr. Cobden-Sanderson did not wish it to be thought that he had any regret for the abandonment of the guilds. In formulating a scheme for the future he had hoped to include the trade guilds of the country, but had come to the conclusion that that was impossible; so he proposed a much smaller scheme, to begin with his own society. He did not speak as one in authority, but merely suggested the scheme as an individual member.

In the past the object of the guilds was to ensure good work, not for the members' own advantage but for the good of trade. A rule ordained that one of a trade should enable others of the trade to finish a work begun, and the first objects were good work and helpful fraternity. The old guilds sought to do this by monopoly and authoritative regulations. These objects might still be made the objects of any society, and the lecturer proposed that they should be clearly established as the objects of the Arts and Crafts Exhibition Society. Their motto should be, "Good Work whether we live or die." It could not be expected to control the members by imposing fines, but it might be done by relying on their honour.

The variety of exhibits showed that they had for the purpose both crafts and craftsmen. Looking, then, at this ideal, he proposed that societies should be formed in the crafts already represented in the exhibition, to adopt the rules of the parent Society, and from time to time hold exhibitions or markets for the sale of their products either separately or together. All would unite in sending their best to the triennial exhibition of the parent society at the New Gallery. Henry Newman, in laying down the principles for the establishment of a University, made a powerful plea that it could not do its work without the Church, which was necessary to its integrity. So, in the speaker's view, good work was the essence of the craft guild, but something else was necessary to its integrity, and this was the Church.

Bricks and Mortar.

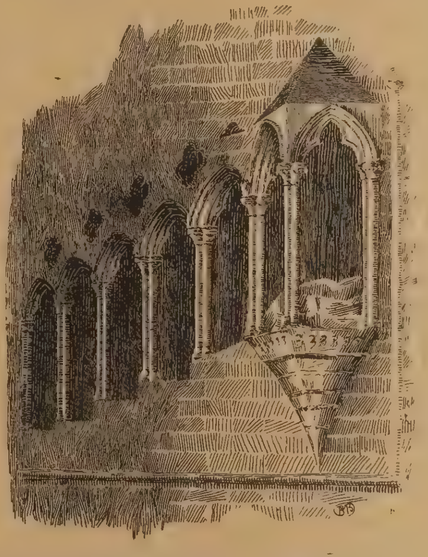
Aphorism for the Week.

"Accurately speaking, no good work whatever can be perfect, and the demand for perfection is always a sign of a misunderstanding of the ends of art."—John Ruskin.

The Fireproofers' Boycott. The executive of the British Fire Prevention Committee have decided to withdraw from participating in the Paris Exhibition. This withdrawal is due to the leading members of the fireproofing trade, who were to have been represented by a large collective exhibit (representing forty-five firms), arranged under the auspices of the Committee, considering that the general tenor of French political, business and social feeling towards Englishmen has of late been anything but satisfactory. After due consideration and conference the Committee fully concur with the firms concerned that this is not an opportune moment for arranging an exhibit of this kind in France. Their own exhibits were to have been of an essentially scientific character. The executive regret that this decision should have been necessary, as the collective exhibit of fire-resisting materials, systems, &c., would have been the first of its kind, and considerable trouble had already been taken in preparations. Whatever opinion this action may arouse, it is a practical example of the influence of national feeling on commercial concerns.

Art and Civilisation. Lord Mayo, president of the Arts and Crafts Society of Ireland, said last week, at a conversazione held at Dublin, that the main intention of their exhibitions was not to promote imitations of known models—a faculty in which Irish workmen and workwomen had long shown themselves unsurpassed—but to suggest to the artisan, to whom every golden age of art owed its greatness, the invention of new forms or new combination of older ideas. The higher civilisation of every country depended upon a keener and more perfect sense of beauty more than upon liberties or luxuries, which could not be universal, and which might often mar their own high promise. In the cultivation of beauty, not only in its loftier sense but on its practical side, by proper designs, by proper adapting of means to ends, by combining simplicity with elegance, every man and woman, nay, even every intelligent youth, could help to make life better and purer, and, therefore, happier; for here the many and the few, the poor and the rich, the native and the settler, the producer and the employer, could combine and contribute to their country's good. Their efforts were directed to efface, as far as is possible, the distinction between the artist and the artisan, and to carry the contemplation of beauty from public galleries and buildings into the homes of the people and into their daily life.—In replying, the Lord Lieutenant (Earl Cadogan) said that he believed there were certain lines and forms in decorative art which had existed for centuries, and which, gradually adopted and possibly improved upon, had formed the staple of what is real and true decoration. He did not himself believe that we should ever do anything better than the older forms of decoration, of which there were so many specimens to be found in the Irish crosses and other monuments of Ireland. But those forms of decoration could easily be adapted to more modern requirements. With regard to what Lord Mayo had said about the value of beauty in civilisation, he thought that if we could do anything to encourage beauty, not only in decoration, but in all other forms of artistic work, we should undoubtedly be doing a great deal not only to improve the taste but really to secure the happiness of those whose welfare was considerably influenced by the beauty or the reverse of their surroundings.

Westminster Bridge. A correspondent of the "Standard" draws attention to what he terms a ridiculous waste of public money by the London County Council on Westminster Bridge by substituting a granite curb for the present cast-iron one, which was in good condition, and has stood well from the opening of the bridge on May 24th, 1862, until the roadway of the bridge was wood paved: since then the wood-blocks, after two or three days' rain, have swollen on several occasions sufficiently to force up the curbing on the south side of the bridge, a fortunate occurrence, he says, or the bridge would have been subjected to a side thrusting stress which it was never contemplated by the designer of it that it would have to withstand. He contends that the substitution of a granite curb for the present cast-iron one will not prevent the liability of the bridge to injury from the side thrust of the wood paving, and consequently (if this is the Council's idea) the present work is a waste of public money, and may even be worse, for whereas the bridge, after being subjected to a considerable strain, formed for itself a stress outlet, it will now have to do this again, with the probable result of considerable injury to itself, and the likelihood of, one day, some of the balustrading being found in the river, and some of the main cast-iron cantilevers being broken. Let us hope that these grim forebodings will not be realised. On the face of it, however, the warning seems to be well-founded, and we hope it will not be overlooked by the Council's engineers.



EARLY ENGLISH PULPIT IN THE REFECTORY AT CHESTER. DRAWN BY MISS B. M. BENNETT.

Early English Pulpit. The early English pulpit illustrated on this page is in the refectory at Chester, which is part of the cathedral building, and is entered from the cloisters. The cathedral buildings formerly belonged to a monastic order, and, as frequently happened, one monk read aloud while the rest of the fraternity were dining—which is probably what this pulpit was used for. There is no entrance to it from the refectory, access being had from a room beyond, through a door at the further end of the pulpit. It is supposed to be a very fine specimen of early English arcading. The drawing is by Miss B. Marian Bennett.

Manchester Cathedral Bells. There are ten bells of four different dates in the cathedral tower at Manchester. The Rev. H. A. Hudson said at the meeting of the Lancashire and Cheshire Antiquarian Society last Friday that as the earliest date of the casting of any of these bells was 1706, they could not be said to possess that peculiar interest which surrounds ancient bells. He described some of the bells in the immediate neighbourhood, especially the small ancient bell at Clayton Hall. As regards the Manchester Cathedral, Warden Langley, of Prestwich, made a gift of bells which lasted until 1679. The peal was then one of five, and the recasting of these, with the provision of an additional bell, was entrusted to William Noon, of Nottingham, who at that time was probably a young man. At any rate, he did his work so ill that in less than thirty years the whole peal had to be recast. Eventually, in 1704, the wardens were directed to recast the whole of the bells. They ordered a peal of eight, which were cast in Gloucester. How well the work was done was shown by the fact that six of these eight bells were as sound to-day as when cast. The sixth, and the tenor, had undergone recasting. In 1825 two additional bells were added.

The Freemasons' Dilemma. The Freemasons of Leeds, having long felt the inconvenience arising from premises inadequate to their needs, decided some time ago to build for themselves a new abode, on which it was proposed to spend £6,000. Plans were adopted quite recently, and everyone expected that the building would be commenced. But an unforeseen and peculiar difficulty has occurred, which prevents a start being made on the work, and throws the promoters of the scheme into very considerable anxiety—and, perhaps, wrath. The facts are these. At the last meeting of the Leeds City Council sanction was given to the project for widening and straightening Cookridge Street, which involves the purchase and demolition of the Roman Catholic Cathedral, schools, and presbytery. It is proposed by the Corporation to schedule land eighty-four yards back from Cookridge Street, the area thus affected comprising 14,625 yards between Great George Street and Guildford Street. The ear-marked land includes the new Masonic hall site, containing about 650 square yards, which, it is understood, the Improvements Committee intend to offer to the Roman Catholic authorities in substitution for the site now occupied by St. Ann's Cathedral and the adjoining buildings. This proposition has naturally put the Freemasons in a fix, for they had been congratulating themselves upon soon being installed in a more commodious building than they now possess. They say they experienced great difficulty in obtaining a suitable site, and that if they are deprived of it they will be put to the utmost inconvenience. It is not absolutely certain that the Roman Catholics would be prepared to build a new cathedral in the locality. The Freemasons are now taking vigorous steps to prevent their proposal being postponed indefinitely, and it is probable that at the next meeting of the City Council there will be much commotion about the matter.

Ugly London. Mr. William Emerson, the president of the Royal Institute of British Architects, referred recently to the ugliness of certain parts of London, and this has prompted a correspondent of the "Pall Mall Gazette" to state that Paris, as we see it, is universally admitted to be a model of what a city should be. Though London cannot now hope to rival its French neighbour, it possesses a degree of picturesqueness and a restrained and dignified beauty which some painters, notably Whistler, have been quick to recognise, in spite of the fact that Ruskin himself compared the architecture of Gower Street with that of the Grand Canal of Venice, to the obvious disadvantage of the former. The object of the correspondent's remarks is to draw attention to a huge building at Knightsbridge, built of stone and brick, which rises on a substructure entirely composed (to all appearance) of sheets of plate glass; the girders are concealed. Though a great expanse of shop front is often demanded, it should surely be curtailed by the most elementary architectural and artistic demands, which, in this particular case, seem to have been ignored. The correspondent concludes thus: "The building, indeed, is secure, and may last for ever. So long as it does, it may serve as a gruesome warning to long-suffering Londoners not to allow the finest sites in their capital to be usurped by ill-designed and inadequate buildings."

Millais. "Of all the painters of our time he was perhaps the least beset by those poetical and intellectual tendencies that have sometimes inspired, and sometimes wrecked, the achievements of others." So says Mr. Comyns Carr in an article on the late Sir John Millais, the "Speaker." Rossetti said of him: "As a mere painter he was head and shoulders above us all!" Continues Mr. Carr: "It was a happy thing for Millais that his work in those earlier days was informed and refined by one whose imaginative impulse was greater than his own. Every man is a poet in his youth; but the simpler sentiment that composed the fabric of Millais' boyish ideal would scarcely have sufficed to give that subtlety of truth to his youthful experiments, unless for a time his individuality had come under the sway of the man he describes as 'the un-English Rossetti.' Indeed, throughout the efforts of his later life, when that influence had been clearly effaced, it may be seen how often Millais' extraordinary mastery over nature left him sometimes its slave. As the extraordinary accomplishment of his earlier days shows something of the mastery of the man guiding the half-tutored hand of the boy, so in all his later work there is to be found something of the *naïveté* of the boy still controlling the riper product of maturity. To the end of his life Millais, even in his painting, was always at school; and, when his work was completed, he had still something of the air of a schoolboy on his way to win a prize."

Egyptian Archæology. In July last a very interesting small temple was discovered at Karnak by natives who were digging there. M. De Grain was telegraphed for from Cairo, and he had the rubbish cleared away, and laid bare a small chapel belonging to the period immediately preceding the Ethiopian invasion under Sabako—the So of the Old Testament. A large number of very interesting papyri belonging to the time of the twelfth dynasty were also discovered at Illahum, in the Fayoum, as the result of excavations prosecuted by a German society, provided with funds by the German Government. The fact that all archæological societies on the continent of Europe are supported by their respective Governments is suggestive in connection with and in contrast to the attitude taken by the British and American nations in this regard. For precedent with the Governments of these richest and most powerful of peoples has never run to patronage in the direction of archæology, and now it seems scarcely likely that it will be otherwise, notwithstanding the potency of British influence there. For three years past the columns and walls of the Temple at Karnak have been strengthened and supported where it was judged expedient. If more funds had been available it is possible that the eleven columns whose recent fall is so lamentable might have been upheld. They will now have to be set up, as well as supported when reinstated, and the Caisse will be petitioned to come to the rescue in the matter of needful monetary equipment for the work. This is estimated by M. de Grain to cost about £7,000. English initiative as regards matters archæological has, however, begun to make itself felt. The instance of Viscount Cromer's reappointment to the headship of Ghizeh Museum of M. Maspero has been approved by all who have the interests of research at heart, and another step in the right direction—an innovation—is the selection of two Englishmen, Messrs. Quibell and Carter, to be inspectors of the monuments and antiquities in Upper Egypt. The Egyptian Exploration Fund has been granted a concession and will send a party of excavators to Abydos, where Professor Petrie will conduct their operations. Brick buildings are being put up on the spot for the accommodation of the excavators. A further concession has been granted also to an American society for excavating at Coptos, where the ancient cemetery in the desert to the east of the town was discovered this summer by natives.

R.I.B.A.

THE NOVEMBER EXAMINATIONS

A BUSINESS meeting of the Royal Institute of British Architects was held last Monday evening at No. 9, Conduit Street, Regent Street, W., Mr. William Emerson, the president, in the chair. The minutes of the previous meeting having been confirmed, on the motion of Mr. Alexander Graham, hon. secretary, a vote of thanks was passed to donors of books recently given to the library of the Institute.

The following gentlemen were then unanimously elected members of the Institute:—As Fellows: Francis William Bedford, of Leeds; James Garry, of West Hartlepool; Josiah Gunton, of London; Edward John Lowther, of London; Robert Falconer Macdonald, of London; Herbert Read, of London; Thomas Taliesin Rees, of Birkenhead; and Francis William Troup, of London. As Associates: Raymond Turner Barker, of London; Henry Thomas Bromley, of London; Herbert Henry Dunstall, of Chatham; Hubert Ernest Gilford, of Purley, Surrey; Charles Hale, of Wellingborough; John Hunt, of London; George Ernest Kendall, of Humberstone, near Leicester; Thomas Geoffry Lucas, of London; Henry Alfred Neubronner, of Penang, Straits Settlements; Walter Gray Ross, of London; William Moss Settle, of Walney, Barrow-in-Furness; Thomas Sharpe, of Manchester; Vincent Steadman, of Bristol; Henry Francis Traylen, of Leicester; Thomas Hubert Hardinge Vowles, of Oldham; and Percy John Warman, of London. As Honorary Associate: The Rev. John William Robbins, M.A., of London. Mr. W. J. Locke, secretary, then read the following list of candidates who have passed the November Examinations of the Institute:—

Preliminary.—G. N. Beaumont, P. R. Berry, H. R. Bird, H. T. Bowell, G. R. Bower, M. S. Briggs, W. E. A. Brown, H. P. Buckingham, E. H. Bullock, C. F. Burton, H. Byron, A. J. P. Carrington, E. L. Cashmore, N. S. Chedburn, O. H. Cockrill, W. J. C. Coulson, A. R. Crisford, T. T. Cumming, R. S. Dacombe, E. A. Dakin, A. F. H. Daniel, W. Davidson, T. E. Davies, A. Dicken, H. Dru Drury, C. C. Duggan, R. K. Ellison, J. P. Firth, A. W. Fletcher, LL.B., Sir F. C. R. Ford, Bart., A. Gilpin, G. R. Griffith, E. L. Hampshire, T. Hansom, W. Haywood, S. T. Hennell, T. H. Hill, W. H. Hillyer, G. S. Hoffmann, B.A., G. Holmes, G. L. Hudson, M. Idle, E. A. Jackson, W. B. Jemmett, N. Jewson, F. G. Johnson, J. T. Johnstone, H. W. Kefford, F. W. Longman, L. Leeper, J. Lees, H. M. Lewis, P. S. Little, B. M. Lloyd, F. J. Lucas, W. H. Ludlow, A. G. Maitland, H. J. Manchip, E. J. Martin, F. P. Martin, J. Martland, C. J. M. Mason, O. P. Milne, H. A. Moon, L. T. Moore, E. B. Muff, P. C. Newcombe, C. E. Okely, S. H. Penlington, J. Petter, E. Procter, E. Quail, H. C. Quérée, S. C. Ramsey, H. Rigg, F. A. Rogers, G. W. Rogers, T. J. Rushton, S. Seale, G. M. Seels, H. F. Sharp, W. C. Short, J. M. Smith, R. G. Spiller, H. B. Squire, W. Steel, A. F. V. Stevenson, G. W. Stokes, F. G. Strudwick, W. J. M. Thomasson, E. H. Walker, A. F. Warth, C. S. O. Watson, A. F. Wickenden, F. W. Williams, W. F. Wills, J. G. Wilson.

Intermediate (in order of merit).—H. Chapman, G. L. Russell, C. W. Beaumont, E. D. Brown, C. A. Broadhead, W. H. Swann, J. P. Hall, C. G. Besant, R. Berrill, C. V. T. Hodgson, C. E. Varndell, E. L. Wratten, E. M. Joseph, G. H. Onions, W. J. Nash, J. J. Wood, C. M. Childs, W. C. Oman, S. Towse, R. P. Blakey, S. G. Hewitt, A. J. Mays, P. S. Widdup, A. Symons, G. F. Ely, H. T. Bill, A. R. Conder, W. E. Couch, T. Gregg, L. A. Jones, L. Lee, R. McM. Roberts, D. West, F. C. W. Wheeler, C. Woodward.

Final (qualifying for Associateship).—F. H. Allen, W. H. Ansell, S. E. Barrow, F. W. A. Buckell, T. J. Byrne, B. A. Charles, D. Mc. L. Craik, A. H. Foster, F. Foster, S. H. Hamp, J. H. W. Hickton, M. Honan, H. E. Illingworth, A. R. Keighley, T. A. Moodie, J. E. C. Shield, J. E. Spain, R. H. Spalding, F. Taylor, R. Traquair, T. Tyrwhitt, H. Watts.

The president then announced that, as Mons. Charles Lucas had been for the second time unable to complete his paper on "The Building of the French Exhibition of 1900" in time for the next meeting on December 18th, owing to the unfinished state of the buildings, Mr. Thomas Blashill, F.R.I.B.A., would read a paper instead on "The Architect in relation to Fire Prevention."

Keystones.

A new organ at St. Andrew's Church. Avonmouth, Bristol, has been provided at a cost of £500.

At the Yorkshire College, Leeds, new leather industries buildings have been erected by the Skinners' Company at a cost of £5,000.

A new Free Church at Aberlour has been built from designs by Mr. Macmillan, of Aberdeen. The total cost will be about £1,400.

A new Baptist Chapel at Netherfield, Nottingham, has been built, at a cost of £1,250, from designs by Mr. W. H. Higginbottom, of Nottingham.

A new Promenade Pier at Lowestoft is to be built at the north end of the borough at a cost of £60,000, and the Duke of Cambridge cut the first sod on Saturday. The pier will be 233 yards long.

Big Electric Tramway Project at Rochdale.—A parliamentary Bill is being prepared at Rochdale applying for authority to construct a working system of electric tramways within the borough, and for the whole of the authorities immediately adjoining, embracing a total length of about eighteen miles. The total expenditure contemplated is about a quarter of a million. It is intended to alter the gauge of the tramways from the present one of 3ft. 6in. to the standard gauge of 4ft. 8½in., with a view to link up with the systems of the neighbouring authorities of Oldham and Bury, which, in their turn, will probably connect with Manchester and other important centres of population. The Bill also seeks power to construct several new streets and to widen others. This will involve a further expenditure of about £50,000. The Corporation is at present installing an electric lighting station, which has been designed to provide the electrical energy for both lighting and traction purposes.

Swansea.—The new poor-law offices that have been built at the foot of Clifton Hill were opened last Thursday. Erected at a cost of £6,219, the building is in the English Renaissance style, and is intended to accommodate not only the different bodies responsible for the administration of poor-law in the Union, but also the Llangyfelach District Council. The elevation—which, though not imposing, is very attractive—is in old brick with Bath stone dressings. Inside there is a fine stone staircase and balustrading, with an arcade on the ground and first floors, and the rooms include the offices of the clerk of the guardians, office of registrar for births and deaths, relieving officers, a large waiting-room for applicants, committee rooms, board rooms, District Council surveyor's office, stores, and strong rooms. The board room is 30ft. square and 23ft. high, with a plastered domed ceiling, oak panelled, and lighted from the top and also by a large side window. Although the board room is on the first floor, the difference in level of the site has enabled an entrance for applicants to be placed on a level with a road at the junction of Clifton Hill and Clifton Row, thus enabling the applicants to enter the board room without going up any steps. The architect was Mr. H. W. Wills, A.R.I.B.A.; contractors, Messrs. Lloyd Brothers; furnisher, Mr. E. Norman, Orchard Street; clerk of works, Mr. Thomas White. The contracting work has been well done, giving unqualified satisfaction to the guardians and to the architect. Messrs. Lloyd's own smith made the ornamental wrought-iron entrance gates, &c.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

GEOMETRY BOOKS.

Torquay.—Oliver Twist writes:—"What do you consider to be the best book on geometry—Science Subject I.?"

Angel's Practical Plane and Solid Geometry, price 1s. 6d.; Rawle's Practical Geometry, 1s.

R.I.B.A. PRELIMINARY.

London, E.C.—In reply to A. P., the subjects given in the Preliminary R.I.B.A. Examination are (1) Short English Composition; (2) Writing from Dictation; (3) Arithmetic, Algebra, and Elements of Plane Geometry; (4) Geography and History; (5) Latin, Italian, French or German: one language to be selected by candidate; (6) Geometrical Drawing or Elements of Perspective: either subject to be selected by candidate; (7) Elementary Mechanics and Physics; (8) Freehand Drawing from the Round.

SCIENCE AND ART DEPARTMENT EXAMS.

Grimsby.—C. E. T. writes:—"I shall be glad if Professor Adams will tell me whether I can obtain answers to the questions set in the elementary and advanced stages of building construction from the year 1894 to 1899 inclusive? I believe he was the author of a book containing answers up to 1893. Also, what is the price, and name of the publisher of Spooner's "Practical Solid Geometry," which was recommended as a suitable book for the R.I.B.A. intermediate examination?"

Solutions to the examination questions in building construction for 1894 were published by Chapman and Hall in *Science and Art*; those for 1895 by Whittaker and Co., in the *Technical World*; those for and since 1896 by Cassell's in *Building World*. Spooner's "Practical Plane and Solid Geometry" is published by Cassell and Co., price 3s.

HENRY ADAMS.

CALCULATING BENDING MOMENT.

Lee, S.E.—P. F. writes:—"On page 211 of E. W. Tarn's "Science of Building," 1890, it is stated that if a joist is required to carry double the usual load, multiply the depth by 1·414; but in his "Mechanics of Architecture," page 89, it is stated that to double the strength of a joist, multiply the depth by 1·26. The former multiplier represents the rule that the strength is in proportion to the square of the depth, for 1·414 is the square root of 2, while 1·26 is the cube root of 2. Can anyone explain how this difference arises, or which multiplier is the correct one?"

The bending moment varies as $\frac{fo}{6}\ bd^2$, where *fo* is the modulus of rupture, and *b* and *d* are the breadth and depth in inches respectively. Therefore, with a constant load and span (and, consequently, a constant bending moment), and also constant modulus of rupture (the material being the same) and constant breadth, the depth will vary as d^2. Consequently, 1·414 is the correct multiplier.

G. A. T. M.

WORKING GELATINE.

Gourock, Scotland.—Stucco writes:—"Please inform me where I can purchase gelatine for moulding stucco enrichment. Also, can I use glue for moulding, and is it best to paint the moulds?"

A first-class gelatine for moulding purposes may be purchased from Messrs. J. G. Smythe and Co., 1, Pleasant Place, Islington, London, N. Gelatine moulds when indurated with a solution of alum and oiled with gum-oil require no painting. Glue is sometimes used for moulding, but the moulds must be painted to protect the surface from the heat of the plaster. Painted moulds, when remitted for use again, always work hard and coarse, besides losing their flexibility. Gelatine, though three times as costly as glue, is the cheapest in the end, as the moulds can be used for casting at once, whereas glue moulds cannot be used until the paint is dry; besides, the gelatine lasts longer and yields cleaner and sharper cast work.

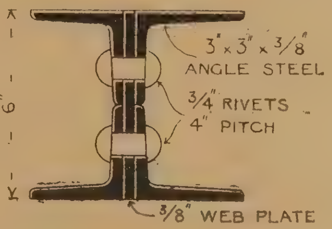
W. M.

CANTILEVERS FOR CARRYING GALLERIES.

Glasgow.—S. H. writes:—"Would one of your staff of experts kindly advise me as to the following points regarding cantilevers carrying gallery in a public hall, of which I herewith enclose a tracing. (1) Are the scantlings of the various members, as figured, sufficient, and is the material disposed in the most economical manner? (2) What weight must be applied at A to render the cantilevers perfectly stable?"

The weight of men in crowds may be taken as 80lb. to 100lb. per foot super; a dense crowd cannot exceed 1cwt. per foot super actual weight. But for churches and public buildings the usual allowance is $1\frac{1}{2}$cwt. per square foot = 168lb., to provide againt vibration from the load being a live (and possibly lively) one. To this must be added the weight of the structure itself. Area supported by each cantilever $8 \times 7{\cdot}5 = 60$ square feet. External load $60 \times 1\frac{1}{2} = 90$cwt. Weight of structure say = 10cwt. Total load = 5 tons distributed on each cantilever or $\frac{5}{8}$ ton per foot run. The bending moment at the weakest part, viz., where the upper side of cantilever leaves the horizontal, will be $\frac{5}{8} \times 2{\cdot}5 = \frac{3{\cdot}0}{2}$ = say 24in. tons from the distributed load + say $0{\cdot}1$ ton $\times 30 =$ 3in. tons from gallery front = 27in. tons in all. Let the mean depth be 4in., then the flange stress will be $\frac{27}{4} = 6\frac{3}{4}$ tons. The sectional area of mild steel necessary to resist this would be about 1 sq.-in., so that a section as in accompanying figure would be ample, with a $\frac{3}{8}$in.-triangular plate in the spandril continued to back; and double $3 \times 3 \times \frac{3}{8}$ stiffeners at face of wall and at back of cantilever. Each cantilever should rest on a good piece of cubestone projecting as a corbel and tailed as far into the wall as possible. It would require twenty tons on the back of the cantilever to hold it down under a full load, and it may be necessary to anchor it down by a strap bolt on the back carried well down into the wall with a $9 \times 9 \times \frac{1}{2}$-washer on the lower end.

HENRY ADAMS.



SECTION OF OUTER END OF CANTILEVER.

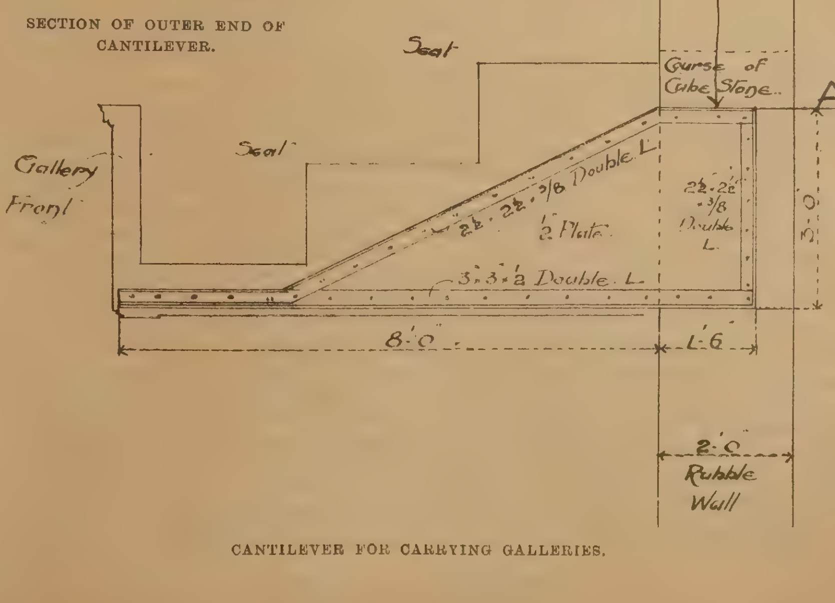
QUANTITY SURVEYING.

Plymouth.—Methodical writes:—"Will you please inform me the correct order of 'taking off.' On referring to Leaning's, pages 20 to 29, I find an 'order' is given. Does this mean that you must at one time take all digging, all concrete, all walls, all fires, all internal openings, all facings, and so on throughout the entire building; or should you measure everything (of every description) up to one level before taking any work above that level? Will you also please inform me if it is possible to obtain a model set of drawings for a small building, together with papers showing the 'taking off,' 'abstracting,' and 'billing' of the quantities. Does Leaning's set of 'Contract Documents' include the 'taking off' papers? By having these latter one could trace the dimensions on drawings and so ascertain the correct order and method of doing this work."

The reference given is to the second edition of Leaning. In the third edition two lists appear which differ somewhat in their order from each other. The first list is the same as in the second edition, and the second one is modified to deal with the various parts more completely at one time, so that no return to them is required, and a continuous series of dimensions may be omitted if any part is not to be executed. As a rule to keep in view, the work should be taken off in the order in which it is executed or fixed, but this has many exceptions. The list is pretty clear as to what should be taken, and when it gives an item it means all the work or material of that sort that comes under the heading of the group. Leaning's "Set of Contract Documents" includes drawings, dimensions, abstracts and bills complete for a small building. It is good practice to go through these and find where every figure comes from, but it is somewhat difficult as a few errors have crept in, and every one has his own way of taking off, some part of which can hardly be brought under rules.

HENRY ADAMS.

A new Fire Station at Islington, N., the foundation stone of which was laid on Saturday, is being built under the superintendence of Mr. Reilly. It will cost between £14,000 and £15,000.



CANTILEVER FOR CARRYING GALLERIES.

New Patents.

These patents are open to opposition until January 8th.

1898. — Road Sweepers. — 20,712. R. Wadsworth, Halifax. Under the axle of the cart is removably attached a bin which receives the sweepings of the road from a circular brush at the back of the vehicle; this brush is revolved by a chain belt connected with the main axle. To enable the gutters to be swept, a brush is provided at the front extending outside the wheel at one side. The dirt which it sweeps up is transferred by the back brush into the bin, which has a hinged flap that can be jerked upwards by the man in charge to throw the dirt into the forward end. Several modifications are included in the invention, one of which provides a dirt elevator.

Distributing Enamel Powders.—27,030. J. Shanks, Barrhead. This is a device for rapidly applying the powder employed for enamelling such articles as baths, so that the coating may be as equal as possible—the bath being heated at the time. The powder is contained in a round box, having a wire gauze or perforated metal bottom, mounted at the end of a tubular handle. In this handle is a spring controlled rod connected at one end with the powder box, and at the other with a pneumatic or electric hammer or ratchet. By this means a rapid and regular vibration is set up, causing a uniform delivery of the powder.

1899. Heating Stoves.—71. R. Haddan, London (*H. Schuppmann, Berlin*). To avoid disagreeable smells and to afford a more economical use of the gases, the heating boiler is connected with a water mantle and expansion vessel, together forming one heating body. The products of combustion go first through the boiler, and are afterwards taken into the expansion vessel, whence they pass into the flue.

Brick Presses.—172. T. C. Fawcett, Leeds. In presses where the sides comes together by means of toggle levers, india-rubber is provided to prevent the jambing of the moulding box. The outer sides of the plates are inclined. By these means the arrises of the brick are made keen and sharp.

Combined Pile Driver and Crane.—2152. Isles, Ltd., Stanningley, and E. Tempest, Marple. Pivoted to the top end of the crane jib are two guides, between which a monkey works up and down in the usual way. Two adjustable side beams extend straight out from the bottom of the jib and hold the guides firm. A ladder is provided at one side of the guides, and the ordinary chain mechanism is provided. When not required, the monkey can be unhitched, and the guides and side beams swing up against the jib, and fastened there. The apparatus can then be used as a crane.

Nails.—17,979. D. Ascoli, London. The body of the nail is similar in shape to a candle flame, and points are provided around the head. This formation claims to make fastenings more secure.

Artesian Wells.—19,407. P. J. Moran, Memphis, U.S.A. Instead of connecting the various artesian wells to the main pumping well by underground tunnels, they are connected by syphon pipes extending near the surface. This reduces the cost and makes cleansing easier.

The following specifications were published on Saturday last, and are open to opposition until January 15th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—23,376, Buzzard, hoists. 23,562, Hutton, utilisation of precipitated sewage sludge. 23,754, Cooper, appliances for fastening the handles or stales in brushes, brooms, &c. 24,188, Villaret and Wahlen, drying apparatus for bricks. 26,284, Lee, disinfecting apparatus for water closets. 26,403, Day, waste-water closets. 27,173, Rowe, manufacture of bricks. 27,396, Wellard, ball and float valves.

1899.—877, Shanks, water closet apparatus. 1,178, Ashworth, method of attaching door and other knobs to spindles. 1,393, Baxter and Taffs, urinals for invalids' use. 3,527, Sellars, coverings for surfaces. 3,969, Pickup, fastening devices for casements, sashes, doors, &c. 5,943, Stampacchia, method of and apparatus for manufacturing hollow ware. 6,306, Cerebotani, instruments for drawing curves. 11,957, Turski, process for the manufacture of oil colours. 14,546, Ham, method of and apparatus for coupling or connecting lead or composition pipes to pipes, taps, &c., also for stopping such pipes. 16,623, Manning, skylights, windows, &c. 18,407, Edwards, clips for fastening and fixing of pipes to walls. 18,819, Heinz and Heinz, blowpipe lamps. 19,192, Allison and English, drying bricks, earthenware, cement, slurry, and the like before burning, or for drying salt, whiting, &c. 19,287, Fiske, manufacture of bricks and the means or apparatus employed therein. 20,139, Catkosinski and Weintraub, manufacture of bricks, tiles, artificial stone, &c.

Professional Practice.

Leeds.—The new Congregational church and schools about to be erected in Woodhouse Lane are estimated to cost £13,500 (exclusive of the land), and have been designed by Mr. G. F. Danby, of 10, Park Road, Leeds. The area of the site is about 2700 square yards, and the buildings will be of stone, in the Perpendicular style of Gothic architecture, somewhat freely treated. The church, capable of seating 800 worshippers, will comprise a wide nave, with narrow aisles, transepts and apse; the latter will be appropriated to the use of the choir, with organ-chamber at one side. At one end is an open porch which forms one of the main entrances and leads to a vestibule, over which is placed a seven-light traceried window terminating in a gable, with small turrets at the angles. At the junction of the nave and transepts next to Woodhouse Lane, the tower, with spire, rises to a height of 130ft. In the lower stage of this is another main entrance. The aisles are divided from the nave by stone columns with arches, over which are the clerestory windows. At the end of the apse is another seven-light traceried window, which is intended to be filled with stained glass. Provision will be made for the erection of galleries in the transepts, these to be approached by staircases and wide corridors connecting the church with the schools and vestries. The school or lecture hall is 64ft. by 34ft., placed at the top portion of the site, with boys' and girls' entrances from Woodhouse Lane—one on each side of the main gable, which will contain a five-light traceried window and have angle turrets. Opening out of the schoolroom eight classrooms are arranged. The two larger ones are situated so that they can be added to the schoolroom when required, by means of patent folding partitions. A large ladies' parlour, pastor's and deacons' vestries, infants' rooms, and the caretaker's quarters face Hillary Place. These will form a compact group.

Skipton.—The new Skipton and District Hospital will have cost, when entirely completed, £7,238. Mr. E. C. H. Maidman, of Edinburgh, is the architect. The building is in the domestic style of architecture prevalent in Yorkshire. On the ground floor, to the right and left of the entrance, are male and female wards, each with accommodation for six beds. There is also a private ward, for two beds, which may be used as a day-room or for paying patients. Near the entrance on one side is the operation room, and the nurses' sitting-room is on the other. The kitchen and offices are at the rear. The first floor contains the matron's sitting-room and bedrooms for the nurses' and servants, including sleeping accommodation for the two nurses of the Town Nursing Association. A detached building has been erected for a laundry, and a mortuary is attached to it.

Keystones.

The death is announced of Mr. T. Powis Reynolds, a well-known architect in Haverfordwest.

The builder of Cromwell Road, South Kensington, S.W., Mr. Thomas Huggett, has died.

Change of Address.—Mr. C. F. A. Voysey has removed from 6, Carlton Hill, N.W., to 23, York Place, Baker Street, W., and Chorley Wood, Hertfordshire.

"One of the Seven Wonders of Wales," Wrexham Church, is proposed to be restored. The Duke of Westminster has promised to give £2,000.

Public Baths at Romford are now being built from the designs of Messrs. Harrington and Ley. They will comprise a swimming bath, 70ft. by 30ft., and six slipper baths.

New Market Hall, Leeds.—The first premium in this competition, amounting to £150, has been awarded to Messrs. Leeming and Leeming, of London. The estimated cost of their building is £73,000.

The Queen Victoria Gallery in the Central Public Library, Manresa Road, Chelsea, is now open to the public, and has been adapted for the permanent exhibition of illustrations and memorials of this historic parish.

Emmanuel Church, St. Thomas, Exeter, was opened last Thursday. Mr. Pratt, of Clyst St. Mary, Exeter, was the contractor. The church is in the Early Perpendicular style of the fifteenth century, and the total cost has been about £8,000.

Bournemouth Extensions.—At the last meeting of the Town Council it was decided to apply for powers to take in some 1,400 acres of common land for plantations, &c. The council have also decided to promote a Bill in Parliament to obtain powers to erect a crematorium at the East Cemetery at a Cost of £3,000.

The wonderful old Castello of Milan, which for years past has been undergoing restoration under the supervision of a body of well-known Milanese architects, archæologists and artists, is approaching completion. The Museo Archæologico (which contains many fine marbles) and the Museo Municipal are now housed in it.

The War and Artists.—At a meeting held on Thursday last under the presidency of Sir Edward Poynter, P.R.A., supported by many of the most celebrated British artists, it was resolved that a committee of the artists of the United Kingdom should be formed forthwith with a view to promoting an exhibition and sale of works of art in aid of the Mansion House Fund.

Coal Smoke Abatement Society.—At the usual fortnightly meeting of this society, held last week, Sir W. B. Richmond presiding, it was reported that about £100 had been received during the last few days to carry on the crusade against "Smoky London": hundreds of letters from all parts of the country, promising support to the movement, had also come to hand.

The Karnac Columns.—Mr. Hilton Price says in the "Egyptian Gazette" that the cause of the disaster in the Hypostyle Hall on October 3rd is ascribed by the Government commission to the removal of the *Sebakh* and other *débris* from the floors of the Temple, which, it appears, supported the bases, and has caused the water to have more play round the bases, already weakened by the infiltration of salts. Mr. Price adds that other columns in the hall are shaky, and may fall.

The Christmas Catalogue, 1899.—We have received a copy of this useful guide to the present season's books, periodicals, &c. Although issued primarily for the bookselling trade, it is full of useful and interesting matter likely to appeal to all book lovers, especially to those who are on the look out for suitable books for Christmas presents. It is published from the offices of the "Newsagent and Bookseller's Review," at 190, Fleet Street, E.C.

Trade and Craft.

CONCRETE AND MOSAIC FLOORS.

The patent granite concrete paving which Messrs. B. Ward and Co., of 15, Great George Street, Westminster, S.W., supply for cow houses and stables is non-absorbent, durable, and is laid down *in situ*, and, being in one piece, there are no joints into which urine can percolate, generating ammonia and injuring the health of the animals. V-grooves are formed in it, and the main channels have a segmental bottom covered by a removable cast-iron grid. This paving is approved by the War Department. Messrs. Ward's improved and registered system of stable drainage consists in having a stable pot, with a box to lift out, inside the building, connecting with an interceptor trap outside, a ventilating pipe being provided between the two if thought necessary. The solid concrete floors made by the firm have a strong steel webbing running through them, while for their patent fireproof, soundproof, and ventilated floor, cellular gypsum slabs, 2ft. 6in. long, 1ft. wide, and about 5in. deep, are used, which are light and strong, afford a thorough protection to the ironwork, and leave a true and level soffit. Gypsum has the demerit of expanding under heat when used in large masses; the slabs used for these floors are, however, fixed between iron or steel joists and filled up to the required level with concrete. The conductivity of gypsum is one-fourth that of slate and less than one-half that of firebrick, so that it is an excellent material for fireproofing —when used carefully. Messrs. Ward also make several kinds of hollow partitions, artificial stone staircases, heads, sills, cornices, chimney pieces, &c., stair treads and wood block flooring. The designs for mosaic floors given at the end of their latest catalogue are very pleasing. The firm could have no better recommendation than the long lists of works which they have executed, which include commissions from the Government, the nobility, and leading companies and corporations throughout the kingdom.

HEATING APPARATUS.

"We have noted with the advance of the science of heating, a corresponding increase in the manufacture of apparatus wholly inadequate to perform the work that is required of it, to any degree of satisfaction. It is of the utmost importance to the trade, that they use and recommend manufactures that are the products of a reliable concern, and thoroughly guaranteed to perform the work for which they are intended, and constructed on principles that are recognised as essential, in order to obtain the greatest power and efficiency with the least consumption of fuel." Despite the errors in punctuation which this extract contains, the advice is sound, though, prefacing as it does a trade catalogue, it would necessarily be taken with a good deal of suspicion. The Gurney Foundry Co., Limited, of Toronto, Canada (their London office is at Queen Street Chambers, 91, Queen Street, E.C.), are not contractors for erecting apparatus and their manufactures (which include hot-water heaters, steam boilers and radiators, stoves, ranges and hot-air furnaces) are sold only to the trade. Messrs. Gurney's "Doric" seamless tubular hot-water heaters are intended to meet the demand for an efficient, durable and economical heater for warming small buildings, and where large quantities of water require to be heated. It has a round fire-pot (for which the advantages of better combustion, greater economy of fuel, greater strength and avoidance of dead corners are claimed) which is made corrugated on the side next to the fire, thus increasing the heating surface, and connects with the dome or top by 2½in. tubes; the dome has cast on its inner side a series of ribs 1½in. deep and ⅜in. thick, which increase the direct heating surface and cause a more rapid circulation of the water. The heater is very neat in appearance and is warranted to be of the very best material and workmanship, any defective castings being replaced free of charge. It is made in numerous sizes. Messrs. Gurney also manufacture the "400 Series," "Oxford," "Bright Idea," "Defiance" and "Jacket" hot-water heaters, and the "Doric" and "Bright Idea" steam boilers. The latter portion of their catalogue deals with radiators of various kinds, ranges and stoves, some of which have a very good appearance.

New Companies.

Forest Brick and Tile Company, Limited.

This company was registered on November 16th by P. Le Brun, 50, Plough Road, Rotherhithe, S.E., with a capital of £15,000 in £1 shares, to carry on the business of brickmakers, merchants, and manufacturers of and dealers in iron, brick earth, gravel, clay, coal, &c.

Northern Wood Haskinizing Company, Limited.

This company was registered on November 6th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £150,000 in £10 shares, to acquire, deal with, work, and turn to account in the counties of Northumberland, Durham, and York (including the Humber ports), certain patents relating to the treatment and preservation of wood, these said patents being the property of the Haskin Wood Vulcanising Company, Limited, and originally granted to G. H. Haskin, the inventor, or his agents, numbered respectively as follows:—3,875 of 1889, 23,866 of 1892, and 18,195 of 1897, and with a view to the above objects to adopt and carry into effect an agreement expressed to be made between the Haskin Wood Vulcanising Company, Limited and this company (by Thomas Harrison); to establish and maintain works for the treatment and preservation of wood, and to carry on the general business of timber merchants, sawmill proprietors; to buy, sell, prepare for market, manufacture, treat, import and export, and deal in and with timber of every description, and in all articles in which timber is used, &c. The first directors (of whom there shall be not less than three nor more than eight) are L. Wood, H. Bell, J. Dent, W. S. Vaugham, G. B. Hunter. Qualification, £1,000. Remuneration to be fixed by the company.

Selby Land Investment Co., Ltd.

This company was registered on November 22nd by Williamson, Hill and Co., 13, Sherborne Lane, E.C., with a capital of £10,000 in £1 shares, to acquire certain land and buildings on the north side of Cow Lane, Selby, Yorkshire, to adopt an agreement with T. S. Ullathorne, and to carry on the business of builders, contractors, decorators, timber and hardware merchants, &c. The first directors (to number not less than three nor more than six) are M. Scott, T. Liversidge, T, S. Ullathorne, T. G. Hawdon, and H. Connell. Qualification, 200 shares. Remuneration as fixed by the company.

Columbia Fireproofing Company, Limited.

This company was registered on November 22nd by Collins and Collins, 37, King William Street, E.C., with a capital of £42,000 in £10 shares, to acquire and deal with any patents and rights relating to fireproofing of floors, ceilings, partitions, &c.; and to acquire a certain invention from C. A. Ralph, of Pittsburgh, U.S.A. The first directors (to number not less than five nor more than seven) are C. A. Ralph, H. W. Berry, H. A. Bull, C. H. Sankey, J. Booth, J. F. Joyce, and J. D. O'Brien. Qualification £200. Remuneration as fixed by the company.

J. Siemers and Co., Limited.

This company was registered on November 23rd by A. E. Griffiths, 5, Bedford Row, W.C., with a capital of £4,000 in £1 shares, to acquire the business carried on at 21, Finsbury Pavement, E.C., as J. Siemers and Co., and to carry on the business of scaffolding contractors and patentees of life and labour-saving scaffolding. The first directors (to number not less than three nor more than five) are to be appointed by the subscribers.

British Challenge Glazing Co., Limited.

This company was registered on November 23rd by W. B. Palmer, 1, New Inn, W.C., with a capital of £10,000 in £1 shares, to adopt an agreement with J. P. Lena and T. G. Welch, to acquire the business carried on at 11, Bermondsey Street, E.C., as the British Challenge Glazing Company, Limited, and to carry on the business of glaziers, shopfitters, &c. Registered without articles of association. Registered office: 11, Bermondsey Street, S.C.

Hall Brothers' Timber Co., Limited.

This company was registered on November 24th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £25,000 in £10 shares, to acquire the business lately carried on by John Hall (now deceased) and James Hall as Hall Brothers, and now by the said J. Hall solely, at Newcastle-on-Tyne Dock, Durham, to adopt an agreement with James Hall, and to carry on the business of timber merchants, timber growers, sawmill and creosoting works proprietors, &c. The first directors (to number not less than three nor more than five) are J. Hall, E. J. Hall, J. Robson and G. W. Bainbridge. Qualification, ten shares.

Port Soderick Developments, Limited.

This company was registered on November 24th, by Waterlow Brothers and Layton, Limited, Birchin Lane, E.C., with a capital of £5,000 in £1 shares, to adopt an agreement between John W. Haworth and this company, to acquire the Ballavere estate, Braddan, Isle of Man, and to carry on the business of builders, contractors, electric and general engineers, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers. Qualification, £25.

COMING EVENTS.

Wednesday, December 6.

Institute of Sanitary Engineers.—Election Committee at 2.30 p.m. General Purposes Committee at 3.30 p.m.

Ruskin Society of Birmingham.—Rev. A. Jamson Smith, M.A., on "Ruskin as an Aid to the Lover of Art." 8 p.m.

Northern Architectural Association.—Council Meeting at 7 p.m., and Students' evening.

Society of Arts.—Mr. Joseph Cash on "Artificial Silk." 8 p.m.

British Archæological Association.—Meeting at 8 p.m.

Edinburgh Architectural Society.—Mr. William M. Page on "Notes on Art." 8 p.m.

Provident Institution of Builders' Foremen and Clerks of Works.—Ordinary Meeting of members at 8 p.m.

Thursday, December 7.

Royal College of Art, South Kensington.—Mr Arthur Thomson, M.A., M.B., on "The Anatomy Human Form: The Upper Limb."

Institution of Electrical Engineers.—Meeting at 8 p.m.

Society of Antiquaries of London.—Meeting at 8.30 p.m.

Carpenters' Company (Carpenters' Hall).—Sanitary Building Construction Examination: Paper work. 5 p.m.

Friday, December 8.

Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.—Mr. D. Bennett Dobson on "Graphic Calculations." 8 p.m.

Birmingham Architectural Association.—Mr. C. R. Ashbee on "The Co-operative System among the Mediæval Builders in England." 6.45 p.m.

Institution of Mechanical Engineers.—Ordinary meeting. Nominations for annual election of officers. 8 p.m.

Institution of Civil Engineers.—Students' Visit to the Works of the Baker-street—Waterloo Railway, in course of construction, at 2.30 p.m.

Saturday, December 9.

North of England Institute of Mining and Mechanical Engineers. (Newcastle-upon-Tyne.)—Council meeting at 1 p.m. General meeting at 2 p.m.

Carpenters' Company (Carpenters' Hall).—Sanitary Building Construction Examination: Vivâ voce examination. 12 a.m.

Monday, December 11.

Philosophical Society of Glasgow (Architectural Section).—Mr. William Howatt, M.I., F.S.I., on "The Measurer and His Work." 8 p.m.

Society of Engineers.—Annual General Meeting at 7.30 p.m.

London Institution.—Mr. Francis Bond, Hon. A.R.I.B.A., on "Architecture and National Character." (Illustrated.) 5 p.m.

Surveyors' Institution.—Ordinary General Meeting at 8 p.m.

Society of Arts (Cantor Lectures).—Mr. Henry Hardinge Cunynghame on "Art Enamelling upon Metals."—IV. 8 p.m.

Victoria and Albert Museum.—Mr. Hugh Stannus, F.R.I.B.A., on "Historic Evolution of Applied Art: X.—Roman Pre-Christian Art." 6 p.m.

Tuesday, December 12.

Sheffield Society of Architects and Surveyors.—Professor T. Roger Smith, F.R.I.B.A., on "Oriental and Indian Architecture."

Wednesday, December 13.

Edinburgh Architectural Association.—Mr. F. W Deas, M.A., on "Notes on Eleventh Century Buildings in South-Eastern Italy." 8 p.m.

Sanitary Institute.—Council Meeting at 5 p.m.

Northern Architectural Association.—Mr. Frank Baker, F.G.S., on "Canterbury and Winchester Cathedrals." 7.30 p.m.

Institute of Sanitary Engineers.—Half-yearly general meeting for the election of officers for 1900, &c., at 4.30 p.m. Annual dinner at 7 p.m.

Birmingham and District Clerk of Works and Builders' Foreman's Association.—Mr. W. H. Bidlake, M.A., R.I.B.A., on "Building Construction of the Ancient Romans." 8 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BISHOP'S WALTHAM (Hants).—For additions to the Crown Hotel. Messrs. Cancellor and Hill, architects, Winchester:—

Hale Bros....	£930	T. Rashley	£915
Pink	920	Whitehead	835

CARDIFF.—For the erection of new warehouses at the Bute Docks, Cardiff, for Messrs. Rose and Co., engineers. Mr. Edgar G. C. Down, architect and surveyor, 31, High-street, Cardiff:—

Ingleson	£1,952 0	Turner*	£1,798 0
Shepton	1,948 15	Lattey...	1,796 0
Evans	1,850 0	Perkins	1,750 0
Hallett	1,830 0	Knox and Wells ...	1,749 0

* Accepted.

EASTBOURNE.—Accepted for the execution of road works in thirteen roads, for the Corporation. Mr. R. M. Gloyne, C.E., Town Hall, Eastbourne:—

Dennis and Co., 134, Terminus-road, Eastbourne £3,189

KEITH (N.B.).—Accepted for additions to house, Rosehall, for Mr. Wm. Gordon, junior (of Yokohama). Mr. F. D. Robertson, architect, 92, Mid-street, Keith:—

Masonry.	
Robert Mitchell, Huntly	£566 0 0
Carpentry.	
G. and R. Cameron, Keith	460 0 0
Plastering.	
Wm. Menzies, Keith	112 12 0
Slating.	
Geo. Ogilvie, Elgin	98 13 0
Plumbing.	
John Wilson, Huntly	97 0 0
Painting and Glazing.	
Morrison McCormachie, Keith	68 3 7
	£1,402 8 7

Note.—Steel beams, ironmongery, and sanitary appliances are not included in the above sum.

LISCARD.—For the erection of church and school, Martin's-lane. Mr. F. W. Dixon, architect, Trevelyan-buildings, Manchester:—

T. Webster	£3,627	J. and G. Chappell ..	£2,956
W. Hall	3,162	Hughes and Stirling ...	2,954
Raffle and Campbell ...	3,050	R. Allen, Priory-st., Birkenhead*	2,795
Woohs and Son	3,010	H. Hardwick	2,641
Haugh and Pilling ...	3,000		
Peter Tyson	2,998		

* Accepted.

LONDON.—For improvements, &c., at Lant-street school, for the London School Board. Mr. T. J. Bailey, architect:—

Treasure and Son ...	£15,016	Killby and Gayford...	£13,762
Munday and Sons ...	14,486	Martin, Wells, and Co.	13,616
J. and M. Patrick ...	14,341	Stimpson and Co. ...	13,464
Lathey Bros.	14,277	Johnson and Co., Ltd.	13,427

White and Co.	13,980	W. Downs*	12,847
Edwards and Medway	13,827		

* Accepted.

LONDON.—For removing boys' offices inside building, rebuilding offices, all departments, new washhouse, and office for schoolkeeper, refitting lavatories, new lavatories and offices for Art School, enlarging boys' playground, new boundary wall, and new drainage throughout at Saffron-hill School, for the London School Board. Mr. T. J. Bailey, architect:—

Lathey Bros.	£2,323 0 0	Edwards and Medway	£2,190 0 0
Killingback and Co.	2,309 13 5	Akers and Co. ...	2,112 1 10
G. Parker	2,298 0 0	E. Triggs*	2,067 0 0
Whitehead and Co., Ltd.	2,225 0 0		

*Accepted.

STONEHOUSE (Devon).—Accepted for the erection of a billiard-room at "Stone Hall," for Mr. J. Lockie. Edgar M. Leest, architect, Public Hall-chambers, Devonport:—

Carpenter, Mason, &c.	
W. J. Oliver, Devonport	£645
Girders.	
The Glengarnock Steel Co.	£24 16 9
Painting, &c.	
T. W. Earl, Devonport	(as per schedule)

CONTRACTS OPEN.

COUNTY BOROUGH of CROYDON.

ERECTION OF CLOCK TOWER.

Notice is hereby given that the Council are prepared to receive TENDERS for the ERECTION of a MASONRY CLOCK TOWER (about 25ft. in height) at Thornton Heath.

Plans, conditions, and specification may be seen at the Borough Engineer's Office, Town Hall, Croydon.

Tenders to be sent to me by ELEVEN o'clock in the forenoon on THURSDAY, DECEMBER 14th, 1899, endorsed "Tender for Clock Tower."

The Council will not be bound to accept the lowest or any Tender.

By order,
E. MAWDESLEY,
Town Clerk.

Town Hall, Croydon,
November, 1899.

WOOD-BLOCK PAVING.
(Mr. White's System.)

THE PROBLEM SOLVED!

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

The London Non-Flammable Wood Co. Ltd.

who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking Orders for the supply of their

NON-FLAMMABLE WOOD.

The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—

THE COMMERCIAL CABLE BUILDING,
THE QUEEN'S INSURANCE BUILDING,
. . and . .
THE R. G. DUNN BUILDING.

NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large Orders have been given by H.M. Government.

Quotations on receipt of Requirements, Address, &c.

THE LONDON NON-FLAMMABLE WOOD COMPANY Limited,

Regent House, Regent Street, London, W.

DRAINAGE AND PLUMBERS' WORK.

By ISAAC YOUNG, Assoc.San.Inst.

A MEETING of the College of Masons took place on Tuesday, November 28th, at the Architectural Museum, Tufton Street, Westminster—Mr. J. Goodley in the chair—when Mr. Isaac Young, vice-chairman of the Sanitary Inspectors' Association and chief sanitary inspector to the Battersea Vestry, read a paper on "Some Details of Drainage and Plumbers' Work." He said:—The clay-jointed drain is no longer regarded as a suitable medium through which to pass sewage matter, nothing less than a water-tight construction being deemed sufficient for the protection of the health and lives of the public, and it is such a method of construction I have set myself to build up to-night. Assuming we have no choice in the selection of the site upon which our drain is to be constructed, and that there is no need to concern ourselves with the question of sub-soil drainage, the first point touched upon is that of levels. To enable this part of the subject to be properly dealt with, the depth of the sewer, whether of brick or pipe construction, should first be ascertained, and, secondly, the depth the drain will be below ground at its upper end. The distance between these points enables the question of fall to be determined. At the same time it must be borne in mind that too great a fall may give rise to trouble equally as much, perhaps, as too small a fall. The next point is the amount of work the drain may have to perform in a given time. In practice it is found that drains which are moderately flushed should not be laid to give a velocity of less than 3ft., nor more than 4½ft. per second. The following table shows the velocity and discharge from drains of the sizes most commonly in use:—

Diameter of Pipe.	Velocity, 3ft. per second.		Velocity, 4½ft. per second.	
Inches.	Fall.	Gallons per min.	Fall.	Gallons per min.
3	1 in 69	54	1 in 30·4	81
4	1 „ 92	96	1 „ 40·8	144
6	1 „ 138	216	1 „ 61·2	324
9	1 „ 207	495	1 „ 92	742·5

The drain must be of sufficient size to carry away, in addition to the liquid passing into it from the w.c.'s, baths, sinks, &c., the rain water from the roof, yards, &c., in connection with the building. I have stated we may have too great a fall; the following well-known gradients will, in practice, be found to give satisfactory results, and are easy to bear in mind:

3in. drains, fall of 1 in 30
4in. „ „ 1 „ 40
5in. „ „ 1 „ 50;

and so on. It will seldom be found necessary to construct any drain larger than a 9in., whilst a 4in. drain will be found sufficient for the greater percentage of dwelling-houses, &c.; 5in., 7in. and 8in. pipes have to be made specially when required in stoneware, but will be found to be very useful, as affording a gradual increase in the sizes of drains where numerous branches enter the main system. The method of calculating the diameter of the pipe required to carry off the sewage from these branches, is to draw a right angled triangle having its sides at the right angle proportionate to the diameters of the two pipes at their junction; the hypotenuse of the triangle gives the dimension required. Having dealt with the level and capacity of the drain, the next point to be considered is the

Materials

of which to construct it. It is generally admitted that all materials used in the construction of sewage drains, should be capable of preventing the percolation of the sewage into the surrounding ground. The pipes must be sufficiently strong to prevent their being fractured by pressure from the ground or other causes, both internal and external; and of such construction as not to be affected by the chemical action of the sewage, and perfectly smooth on their inner surfaces to prevent lodgment of the matter passing through. There are practically only two materials to our hand capable of performing these several functions, viz., iron and stoneware glazed pipes. Lead pipes for drains are sometimes used, but the dangers arising from the metal being converted into carbonate when the pipes are laid in contact with lime and moisture, are so great that I consider it very inadvisable to construct drains of this material. The old method of constructing brick drains for dwelling-houses is happily a work of the past, and I need not therefore further refer to it, except to say that on no account should they be so constructed, as it is practically impossible to make such drains water-tight; and, further, they are not so cleanly as those constructed of iron or vitrified ware. All drains, as far as practicable, should be outside the building. Where this, however, cannot be obtained, as in terraced houses, they should be constructed with

Iron Pipes.

No other form of drain should be permissible inside a building used—or likely to be used—for human habitation. Where iron drains are provided, it must be a *sine quâ non* that the pipes or other iron fittings shall be protected from oxidation. There are several ways in which this can be effected. One found to be effectual is known as the Bower-Barff process, the pipes in this case being subjected to superheated steam, with a hard coating of the black magnetic oxide. The iron pipe most commonly used is treated by what is known as Dr. Angus Smith's solution, which is a mixture of pitch, coal tar, resin and linseed oil. Iron pipes are also made with a porcelain enamel lining, but I have had very little experience of them, and cannot consequently speak as to their practical efficiency. It does, however, occur to me that the enamelling, beside being liable to damage during transit and laying, would be subject in actual use to alternate changes of hot and cold water, and that as the expansion and contraction of the enamel would not be in the same ratio as that of the metal, I am of opinion that after being in use for a time it would be found to crack and peel off, leaving the iron exposed to any chemical or other action which might be set up. I have found, from considerable experience, that pipes treated with Dr. Angus Smith's solution, and with properly caulked joints of molten lead, answer well. The joint should be first yarned, and this driven home to the back of the socket, or asbestos rings may be used. One other great advantage iron pipes have over stoneware is that the former, being made in 9ft. and 12ft. lengths, have only a fourth or sixth the number of joints stoneware pipes have, and as the joints may be regarded as the weakest part of the drain they should be as few in number as possible. Whilst speaking upon the jointing of iron drains, it may not be out of place to state that where very large quantities of hot water pass through drains, as is frequently the case in certain classes of buildings, there is a possibility that the

Joints made in Lead

will be found at times to become defective owing to the expansion and contraction of the pipes. All pipes used in iron drainage construction should therefore have the spigot-end somewhat enlarged, and a groove formed in the socketed end; this to a great extent prevents the slipping out of the lead. A further precaution is sometimes adopted by having the socket and spigot-ends made longer than those of the ordinary iron pipes, and the spigot-end also somewhat stouter than usual. The joint is made by means of asbestos rings only. Such a joint allows expansion and contraction to take place without injury to the joints. The making of joints to iron drains by means of molten lead has been taken exception to because of the voltaic action liable to be set up between these two metals; but if the pipes are at all times protected from oxidation, the lead is not in actual contact with the iron, and no fear need arise in our minds upon this question.

Iron drains must have good foundations, either by means of a bed of concrete throughout their entire length, or by piers built about 3ft. apart. It will be found an advantage not to concrete in the drain, or even to cover it with earth if this can be avoided. Iron channels can now be obtained, and these should always be used in connection with iron drains; they will be found to have one important advantage over those of the stoneware type in that they can be obtained with either bolted iron covers or a locking bar arrangement, which makes them both air and water tight, and also prevents the fouling of the chambers by the sewage passing through. I have dealt rather fully with iron drainage construction, because I feel that it will become in time more generally adopted when its advantages over the stoneware form of drain are properly recognised by architects and other professional men.

Stoneware Drainage.

I have not, so far, been favourably impressed with many of the patent jointed stoneware pipes upon the market, and do not, therefore, propose to enter into the merits or demerits of them, except in one instance. Most of these patent joints have a special form of construction upon their spigot end, and, as we know in practice, pipes have to be cut in varying lengths; the efficiency, if such there be, in most of the so-called improved form of pipe is destroyed by this act, and the joint has then to be made in the ordinary way. There is, however, one joint which, in my opinion, is worthy of mention, viz., the Strutt patent joint. The only difference in this pipe from those in ordinary use, is that the alteration is in the socket, and consists of a kind of rebate, into which the spigot end connects, thereby ensuring a true invert being formed in the line of drain, and further ensuring the joint being equally strong throughout, if properly made in cement in the usual way. All vitrified-ware pipes should be carefully selected. They should be perfectly straight from end to end, in cross section circular, well glazed internally and externally and the internal glazing especially very smooth, and the sockets square—not wedge shaped; with pipes of the latter description I have frequently found the joints, however well made, will not stand the water test, and any pipe not capable of this test should at once be discarded. It is found in practice, if the work is skilfully executed, that ordinary stoneware pipes answer all practical purposes, and leave nothing further to be desired in this method of drainage construction. No modern system of drainage can be considered complete without

Inspection-Chambers,

or manholes, as they are at times termed. The bricks used in these should be hard and close in texture, and rough on the surface. Good hard stocks are the most suitable for the purpose. I disapprove of building chambers in glazed brickwork, owing to the fact that the joints are exposed, and that the glazing is frequently found to flake off, either in laying or through the action of frost. It is difficult to make such chambers water-tight; that they should be so is as important as that the drains should be. Chambers built of stock bricks require to be internally rendered in cement, and before this is carried out the joints should be raked out to a depth of about $\frac{3}{8}$in. in order to afford a key for the cement rendering. Care should be exercised in doing this by trowelling the surface perfectly smooth, and not allowing the trowel to cut into the cement at the angles as is frequently done. Chambers should be provided at all important changes of line and gradient, and also in connection with the intercepting trap, of which I shall presently speak. The sizes of the chambers will be determined to a great extent by the work they have to perform and by their depth. They must, however, be of sufficient size for a person to enter for testing purposes or to use the drain rods in cases of stoppage. Chambers should not be built with lime mortar, but in sand and Portland cement. All tributary drains must be made to connect with the main drain obliquely in the direction of the flow, and as far as possible brought into the inspection-chambers. Channel bends and curves to suit all positions are made, and, with a fair assortment of these on the job, no difficulty will be experienced in selecting those most suitable for the purpose required. Channel bends should only be used in cases where the tributary drains must, on account of difficulties in fall, be connected at the invert. Three-quarter channel curves discharging into the main drain on the top edge of the main channel will be found to answer better in actual practice than bends of the half-pipe form. They should be carefully selected, as, like the pipes, they are liable to warp and become badly shaped in burning. Proper cement benchings must also be formed from both main channel pipes and bends.

Interception from the Main Sewer

should in all cases be provided, and great care in the selection of the trap for the purpose should be exercised. The outlet should be 3in. lower than the inlet; it should have not less than a 2in. water seal, and should not hold more water when at rest than is absolutely necessary. From the outlet side of the trap a raking arm for controlling the portion of drain on outgo of interceptor to the sewer should be provided. In fact, as is now the case with most of the better forms of traps, it should form part of it. The raking arm finishes at the inner face of the outer wall of the inspection chamber, and should have a moveable cap, preferably worked on the screw principle, or an interceptor can be used, with screw stoppers on inlet and outlet side. Such traps dispense with the usual channel bends. Some difference of opinion still exists as to the ultimate utility of the intercepting trap, many persons contending that the continued interception of house drains from the sewers will cause the latter to become a serious danger to the public health. To such I would say, it is not the duty of the house drain to ventilate the sewers of the sanitary authority, and that, as the provision of this trap is a safeguard to the occupants of the house, no objection should be offered to its use. Decomposing sewage generates dangerous gases which are rendered more dangerous when the sewage becomes mixed, as it does in town, with large quantities of hot water and waste of all kinds from chemical works, factories, breweries, tanneries, slaughterhouses, &c.; and, further, sewage appears to be a natural habitat for the development of germs of certain contagious diseases; it is upon these grounds that I advocate the use of interceptors. Let the owner of property protect the health of his tenants, and the sanitary authority the lives of the public generally, by ventilating the sewers vested in them directly into the atmosphere by means of plenty of open surface gratings and upcast shafts, and further by seeing that the sewers have such falls as to be self-cleansing, or, where the latter cannot be obtained to effect this, by providing automatic flushing chambers.

All chambers should be provided with iron air-tight covers. These should be galvanised, and, preferably, either of the locking or bolted type; in all such cases the locking arrangement or the bolts should be made of gun-metal. Wherever means will permit, an automatic flushing tank should be provided, discharging not less than twice per day, in the space of a few seconds, a body of water of not less than thirty gallons. Where, however, as in the majority of cases, the financial aspect is of great consideration, a little forethought in the planning of the house may be the means of more effectually flushing the system of drainage than generally obtains, as, for instance, by providing the bath-room, and, say, one of the closets at the head of the drain.

Ventilation of the House Drain.

Ventilation to all systems of drainage is a matter of considerable importance, and two shafts, at least, are necessary to accomplish this, the one being the inlet fixed near the intercepting trap, which, if well away from windows, &c., need not be provided with a mica valve, and the other pipe at the head of the drain, connected direct thereto and continued upwards, terminating in a domical wire top several feet above all windows. They should not be fixed to chimney stacks if this can possibly be avoided. It is frequently found in practice that the soil pipe to the w.c.'s above the ground floor can be utilised as the upcast drain ventilator, and is found in such cases to efficiently ventilate the same.

The Laying of the Drains.

In excavating, the ground should be first lined out from chamber to chamber, with the lines of drains between these points perfectly straight, so that whatever bends are necessary in the system of drainage shall be formed in the chambers only, as far as is practicable. The earth should then be removed to the depths required, the gradient of the bottom of the trench when finished being similar to the fall the drain will receive. Pegs should then be driven in about 10ft. apart to regulate the thickness of concrete, or, preferably, two bricks placed in front of the sockets and two immediately behind upon the bottom of the trench every 2ft. apart, and the under concrete then filled in to the level of the bricks or pegs. When the concrete has had time to partially set, the bricks in front of the sockets can be removed and the pipes laid in. By this method it will be found the pipes lay fairly on the bed of concrete from end to end, whilst the sockets will project into the holes left by the removal of the bricks, and will give sufficient room for the drain-layer to make his joints properly. When a fairly long length of pipes has been laid in position, a slight levering process from the upper end should be applied. This will force the pipes home into the sockets. A pailful of concrete laid on each side of the several pipes will keep them in position. The joints should then be proceeded with, beginning at the lower end. The operation should be performed twice, apart from the yarning; if yarn is used it should be untarred. The joints should be filled with cement and roughly finished, and after the topmost joint has been dealt with, the workmen should again begin at the lowest joint and trowel the same off to a smooth surface. After the joints have had time to set the pipes should be filled with water and allowed to stand at least two hours, when the concreting can be completed. I find it a good practice to leave the water in the drain whilst the side and top concreting is being carried out. Considerable care is necessary in carrying out this concreting, and also in filling in the upper earth. The several lengths of drain being laid in, and the chambers completed, a final testing of the work should in every case be made, both drains and chambers being charged with water, and allowed to remain so charged for three or four hours. The cement used for jointing must be well ground and thoroughly cooled. I discountenance altogether the system which largely prevails, of laying the pipes upon bricks and filling in the under concrete after the joints are made. It is in such cases I have frequently found, when testing drains finally, that the work has been defective, and when opened up to discover the cause, I have discovered that the pipes have not been laid fairly on the bed of concrete, and consequently have been fractured, or the joints broken, owing to the weight of earth above the drain. Drains passing beneath walls must either have an arch turned over the same, or a piece of York stone built in the wall to protect the drain in case of settlement. The practice of

Levelling each Pipe

is to be condemned; 6ft. to 10ft. tapering straight edges should be employed (the tapers being equal to the fall of the drain) for the purpose.

It would be impossible for me to enter fully into the advantages and disadvantages of the various forms of closet traps, &c., whose name is legion. The simpler the form of closet the better. Avoid those with complicated mechanism, and only use such as are constructed upon sound scientific principles. The simplest form of closet, and one of the most effective for mansion and cottage, is, in my opinion, the washdown, whether made as a pedestal, as pan and trap in one piece, or separately; if the latter, however, the joint between pan and trap should be below the water line. The pan should have as little superficial area as possible, and have a sloping front and nearly straight back. The flushing rim should be of such form that, whilst sufficient water is admitted to the pan to thoroughly cleanse the sides, the greater quantity should be admitted either at the back or front, to effectually remove the contents from pan and trap each time the apparatus is used. I only know of a very few

Valve Closets

that can be considered thoroughly efficient. In connection with this form of closet, there is always an overflow from the basin, and it should be observed that this is trapped at the outlet from basin, and connected into the valve box in such a position that the valve at the bottom of the basin opens back against the outlet of the overflow. In numerous valve closets the opposite will be found to be the case, and consequently the overflow of the basin is liable to be choked with filth upon the discharge of the closet. Valve closets may be supplied with water in two or three ways; if by a flushing cistern an after-flush arrangement is necessary to ensure the basin having a body of water in which to receive the fæcal matter; this may be said to be one of the principal advantages of a valve closet. It may also be supplied with water by means of a pull-away valve beneath the seat, the supply being given by lifting the handle attached to a bar; the after-flush in such a case is regulated by either a bellows regulator or other forms which cause the supply valve to close slowly. A third method is to supply the closet direct from a cistern above, the size of the flush pipe in such a case being determined by the head of water. It must, however, be borne in mind that if either of the two latter methods of supply be adopted, the cistern must not supply water to any fittings likely to be used for drinking or potable purposes, otherwise the water may be contaminated and cause serious illness. Wash-down closets should at all times be supplied by syphonic action flushing cisterns, with 1¼in. to 1½in. flush-pipes. In some of the better forms of wash-down closets an enlarged pool of water is provided at the bottom of the basin for the purpose of more effectually immersing the fæces during use, and preventing the fouling of the sides of the pan. No closet should have a less flush than two and a half to three gallons. The majority of the water companies' regulations do not permit this quantity, only allowing a two-gallon cistern to be used. It is to be hoped that they will be compelled before long to yield to this most necessary alteration, especially in the smaller classes of property, as in such the flush of water from the w.c. constitutes the principal flushing medium for the drainage system. All traps should be of the syphon principle, and without angles as far as practicable, including those used in connection with the drains.

Soil Pipes

may be either of lead or of iron. The former being malleable, it can readily be adapted in the hands of the skilful plumber to the various positions required in the construction of the soil pipe, and, being made in 10ft. lengths, the number of joints is few. These joints may be of the ordinary wiped form, or of a more ornamental character, where such are desired, in the form of astragal joints. Iron pipes are now made which answer well for soil pipes, the joints being made in molten lead, in the same manner as for iron drains. The pipes and other fittings must be protected from oxidation, either in the manner before mentioned or by galvanising. Specially made junctions, inverted and otherwise, can now be obtained, and will, if the work is well carried out, be found to answer very effectually. All iron waste, soil and vent pipes are best fixed clear of the buildings. The wastes of slop sinks and urinals must be constructed in a similar manner to soil pipes, as the filth deposited is similar to that deposited in a water-closet. All soil-pipes should be directly connected with the drain (having no traps in it except that at the outgo of the w.c.) and continued upwards for the purpose of ventilation. I would remark here that the primary object in ventilation is not, as many believe, to effect the removal of gases caused by decomposing sewage matter, so much as to prevent their development by causing fresh air to enter the drain and waste pipes of every description. Next to this, of course, the ventilation is provided to relieve the compressed air and to prevent the syphoning out of the water seals of the traps by the passage of water through the pipes, for when this takes place the house is left open for the drain air to escape into. All soil-pipes should therefore be continued upwards their full diameter and made to terminate above the roof clear of windows, chimneys and other openings in the roof, and also well away from cisterns. The top should be protected in a similar manner to drain ventilating pipes. The longer the vertical length of soil-pipe the quicker will be the velocity of the water passing through, and air must enter the vent pipe at the same rate, otherwise the water seal of the trap will be broken. This brings me to a point I wish particularly to draw attention to, namely, that in very long ventilating pipes the air does not enter as quickly as is necessary to preserve

The Water-seal of the Trap,

consequently a portion of air will pass through the trap, pushing out the water contained in it to gain access to the partial vacuum in the soil-pipe; and if we therefore imagine for a moment that the ventilating pipe was so long that the friction in it caused the air to travel so slowly as to render it useless for preventing trap syphonage, it would, in such a case, be found necessary to make the ventilating pipe considerably larger than the soil-pipe. It will be found that bends in a ventilating pipe materially retard the passage of air through it, and these should never be fixed if they can possibly be avoided; neither should cowls be fixed at the top of ventilating pipes for the same reason. If a pail of water is poured down the topmost of three water-closets situated on the first, second, and third floors on a stack of soil pipes, the contents passes into the vertical pipe and drives the air before it, compressing it into a smaller space than it originally occupied in the part of pipe between the upper and middle closets, before the air in the next part of the pipe is set in motion. The effect of this is that the water rises on the inlet side about $\frac{3}{8}$in, and in less than a second afterwards the lower trap is similarly affected by the extra pressure from the air inside the vertical pipe, but after the water from the upper closet has passed the middle branch soil-pipe a reverse action of the air occurs. Air entering the top of the vent-pipe is slightly retarded in its progress through the pipe, owing to friction against its sides; the air becomes, consequently, rarified, and in attempting to keep its original bulk, takes off a part of the press on the outlet side of the trap, so that, it will be seen, the water in the trap is first pushed from the soil-pipe and then drawn into it, causing the water seal of trap to be reduced. This evil effect of bad ventilation can be avoided by connecting an anti-syphon pipe with the branch pipe at the outgo of the trap. This has a threefold use, first by preventing the soil-pipe acting as the longer leg of a syphon, pulling the water out of the traps; secondly, by relieving the compressed air during the time the water is passing down the vertical soil-pipe; and, thirdly, by preventing the accumulation of carbonic acid gas in the branch soil-pipes, the effect of which is daily seen in old, unventilated soil-pipes and D traps, in which it will be found the metal has been converted into carbonate. In practice it is usually found that 2in. pipes are sufficiently large to prevent syphonage, &c., except in the case of very high buildings, and that a 4in. soil-pipe is sufficient for a stack of seven or eight w.c.'s. If, however, more than three w.c.'s connect into the soil-pipe it would be wise to provide the main anti-syphon pipe $2\frac{1}{2}$in. or 3in. in diameter, or reduce the size of the branch soil-pipes to each closet-trap to 3in. or $3\frac{1}{2}$in. The actual position where the anti-syphon pipe is to be connected in the branch pipe is provided for in the Metropolis by the by-laws of the London County Council, made under Section 39 (1) of the Public Health (London) Act of 1891, which prescribes that it shall be connected at a point not less than 3in. or more than 12in. from the outgo of the trap, and this may be taken as a fair guide generally. On no account must such pipes be connected at the top of the trap, although it would appear, theoretically, this is the proper position, but in practice it is found, where pipes have been so fixed, they become in a very short time partially or entirely choked by soil, &c., being forced into them on the discharge of the closets, &c.

Having been thanked for his lecture by Mr. G. H. Jones, hon. sec. of the College, and Mr. Goodley, Mr. Young, in reply, wished the College continued success in its endeavours to bring about the revival of the old guilds of masonry. He understood it was not a trade union, which fact would undoubtedly ensure its prosperity.

Surveying and Sanitary Notes.

Mr. W. R. Crabtree, chief district surveyor at Sheffield, has been appointed highway surveyor to the Doncaster Rural District Council.

The Guiseley Sewage Works.—At the monthly meeting of the Guiseley District Council on Wednesday evening, Mr. Johnson, engineer, submitted estimates of the cost of carrying out the improvements at the sewage works required by the Local Government Board before they would sanction the loan of £5,500 already asked for. The engineer estimated the cost of the additional works at £1,120, and it was resolved to make application for sanction to borrow £1,200 in addition to the £5,500 previously asked for.

Glasgow's Unclean Streets.—Great dissatisfaction is expressed in some quarters at the manner in which the streets of Glasgow are cleaned, and at the last meeting of the Town Council the minutes of the Cleansing Committee were referred back. It is, perhaps, of interest at this juncture to quote from a parody in "Punch":—

> Paris is clean, why not St. Mungo, then,
> And every street within the Second City?
> We have no lack of water, brooms—or men
> Eager for any labour, more's the pity!
> Turn all hands on to sweep and scrape and squirt
> Our dreary, weary town of Dreadful Dirt!

Subways to City Cables.—The City Corporation intend to apply for Parliamentary powers to construct conduits for electric lighting, telegraphic and telephonic cables.

A Building Accident Claim.—On June 19th last a man named John Baker was working on some new houses at Normanton, and whilst standing on a wall was knocked down by a batten, which, it was alleged, another workman named Gibson had passed to him negligently. His collar-bone was fractured, and he died soon afterwards. On Tuesday in last week, at the Wakefield County Court, the legal representatives of Baker sued Gibson, and received damages for £50.

A Peculiar Fatality.—A remarkable case of death from electric shock was investigated by the Bradford City Coroner last week. Deceased was Edgar Driver, nineteen, electrician, who, in repairing an arc lamp, accidentally touched a wire and was killed. Expert evidence showed that the shock was only 225 volts, whilst the current was not generally fatal under 1,000 volts, and men had survived a much more severe shock than this. There were latent dangers in electricity not yet fully realised. A verdict of "Accidental death" was returned.

STRENGTH OF CONCRETE SLABS.

A JOINT committee of representatives of the Northern Architectural Association, the Newcastle, Gateshead and Tyne District Master Builders' Association, and the Council of the Building Trades' Exchange, was appointed last March to organise and carry out an independent test of the comparative breaking strengths of concrete slabs made with and without the addition of "expanded metal." The details were left in the hands of a sub-committee, under whose personal direction and supervision twelve slabs were set up on wood centerings and brick piers in the foundry yard of the Gallowgate Iron Works, belonging to Henry Walker and Sons, Limited, on July 20th and 24th last, the centerings being removed on August 16th. The slabs, which were calculated within a fraction of the cost per yard either way, were cast in wooden boxes supported by brick piers, and the concrete was mixed according to the specification of the sub-committee as follows: "Concrete to be gauged 5 to 1 for the 5in. slabs and 3 to 1 for the 3in., and the cement to be of the ordinary gauge of 2,500 meshes to the square inch. The concrete for the 5in. slabs to be composed of four parts clean washed gravel to pass a 2in. gauge, one part of clean sand and one of Portland cement. The concrete for the 3in. slabs to be composed of two parts clean washed gravel to 1in. gauge, one of clean sand and one of Portland cement."

The cement was procured from a merchant in the ordinary way, and when tested there was *no* residue through the 50 sieve, and only two per cent. through the 70 sieve. It, however, only weighed 94lbs. per striked bushel.

The 5in. slabs at 5 to 1 with metal were Nos. 2, 5 and 8, and those without the metal Nos. 1, 3 and 4, being 8in. thick, the extra 3in. being necessary to equal the value of the metal (No. 10 gauge). The 3in. slabs at 3 to 1 with No. 8 metal were Nos. 9, 10 and 11, and those without the metal were increased to $4\frac{1}{2}$in. thick to equal the value of the metal omitted and were Nos. 6, 7 and 12. Each slab had 6in. wall hold, each end only supported. The corresponding slabs, with and without metal, were made out of the same gauging of concrete. All were 4ft. wide.

In the presence of several members of the committee and a number of other gentlemen, the slabs were gradually weighted with pig iron on September 19th and 20th last, and in their report the committee state the results to have been as follows:—

Slab No. 1 broke before the test began, two men and six pigs of cast iron being on it—*i.e.*, about 9cwt. No. 2 broke under a load of 237cwt. 3qrs. 14lbs., showing $\frac{1}{8}$in. deflection under 75cwt., $\frac{1}{2}$in. deflection under 175cwt.; it cracked at 220cwt. No. 3 broke under a load of 22cwt. 2qrs. 18lbs. No. 5 was unbroken under a load of 340cwt. 1qr. 21lbs., though it showed $\frac{5}{16}$in. deflection: it was unsafe to pile the pig iron to a greater height. When the load was taken off the slab went back to nearly its original straightness. No. 4 broke under a load of 124cwt. 2qrs. 20lbs. No. 8 was unbroken at 270cwt. 2qrs. 2lbs., at which point the piling of pig iron was considered unsafe, being about 11ft. high. The slab showed a slight deflection under a load of 261cwt. 2qrs. 12lbs., but went back again.

It should be mentioned that the slabs, when cast, remained exposed in the open to a continuous hot sun which had "spiders webbed" the surface of the cement. No. 4 slab was partly protected from the sun.

Slab No. 6 broke accidentally while the men were piling up the weight on No. 5. No. 10 broke under 96cwt. 1qr. 17lbs. No. 7 broke under 17cwt. 1qr. 25lbs. No. 11 broke under 113cwt. 0qrs. 22lbs. No. 12 broke under 10cwt. 3qrs. 10lbs. No. 9 broke under 213cwt. 3qrs. 8lbs.

Generally speaking there was only slight deflection before breaking. The fracture of the expanded metal was clean and free from crystalline appearance, the strands of steel having come closer together under the load, the "diamonds" being considerably elongated.

Masters and Men.

Masons Locked Out at Hawick.—Messrs. Bell and Turnbull were fined £10 by the Operative Masons' Union for employing a "black" firm in Hawick to do work at a job at Boncaster. The payment of the fine was refused, on the ground that the job was beyond the five miles' limit. In consequence of this dispute nearly all the masters in the town have locked out their men.

Barry Carpenters and Joiners.—Dr. Neale presided at the annual dinner of the Barry branch of the Carpenters' and Joiners' Society, held last week. A large company attended, including Mr. D. Richards, Southport, a member of the Executive Council; Mr. C. Halford, secretary to the General Union; Councillor Paterson; and others. Mr. J. Lace, secretary of the local branch, responding to the toast of the "A.S.C.T.," referred to the progress made locally, where they possessed a membership of 121, the income for the past nine months being £225 and the expenditure £108. During the year there had been paid in sick and relief claims £44 6s., and only £2 15s. as out-of-work money.

The Iron and Steel Trade.—The price of manufactured iron in bars, plates, rails and angles, as returned to the Northern Conciliation Board, Middlesbrough shows the nett selling price for September and October at £6 11s. 6d.—the highest rate for nearly ten years—making a further advance of 4s. 6d.; ironworkers' wages by the Sliding Scale advance 2½ per cent., in addition to the previous advance this year of 10 per cent. The return for September and October to the Midland Iron and Steel Wages Board, Birmingham, gives the average price at £7 12s. 10d., no less than 8s. 6d. above the average of the two preceding months; this allows of an advance of 2½ per cent. in wages, the increase on the year being 12½ per cent. Steps were being taken to apply the Midland sliding scale to a number of the sheet works of South Wales. It is proposed to form a local committee in that district to be affiliated with the Midland board. The threatened difficulties in the Scotch steel trade have been satisfactorily adjusted; at a private meeting last Thursday of the Conciliation Board for the Manufactured Steel Trade of Scotland, it was agreed to advance wages 5 per cent. from December 3; and the men, who asked for 10 per cent., have accepted the offer.

An Unsuccessful Claim against Builders.—An action, under the Workmen's Compensation Act, was recently brought before Judge Templar at the Darlington County Court, in which Michael Flannery and Mary Flannery claimed £78 damages for the loss of their son, John Flannery from John Guthrie and Son, builders, of Darlington, by whom he was employed at the time of the accident. He was employed by the defendant on a new building in Darlington, and had several times previously descended from the top of the building by a rope, because he came down quicker, but had been warned by the foreman not to do so, as it was dangerous. On August 31st last, in descending in this way, he met with an accident, and died the following day. For the plaintiffs it was urged that the action came within the scope of the Employers' Liability Act, as there was machinery, including a pug mill, pulleys, &c. For the defence it was contended that there was a staircase which Flannery should have used, and that the accident was due to the man's wilful misconduct. After hearing the evidence, His Honour dismissed the application with costs, on the ground that it was not within the course of the man's employment to come down the rope, and that he was guilty of wilful misconduct in doing so; and further, that the father and mother were not dependant upon him for the necessaries of life.

Builders' Notes.

London County Council.—At the meeting held on November 28th, after considerable discussion, the recommendation of the Finance Committee with regard to the new asylum at Horton was adopted. This approved the excess expenditure of £117,000, but suggested that the facts should be sent to the General Purposes Committee for investigation and report. In defence of the expenditure, Mr. Hubbard (chairman of the Asylums Committee) said that when the Council appropriated £350,000 for the asylum they were told that the building could not be erected for that sum. The detailed estimate given was but a rough one. For instance, the foundations were estimated to cost £31,000, but the lowest tender received was £52,000. For the superstructure the architect's estimate was £281,400, but when the manager of the Works Department was asked for his price he fixed it at £284,400. Tenders were then invited, and it was found that the lowest was for £296,575, and the highest for £299,900. After negotiations the work was given to the Works Department. It was, therefore, easily seen why much of the expenditure was in excess of the estimate.

London Improvements.—During the next Parliamentary session H.M. Commissioners of Works and Public Buildings will apply for powers to acquire land to the south of Lincoln's Inn Fields for the purpose of extending the existing buildings of the Land Registry and other public offices. The Postmaster-General proposes to acquire numerous properties for the service of the post office, including land and premises in Upper Street for a new Northern District Post Office, in Whitechapel Road for the extension of the post office, in Union Street, Southwark, for a new parcel office, and at Brockley for a new sorting office. The London County Council have their Bill for the Thames Embankment extension and Westminster scheme; they also propose numerous street widenings in various districts. In their General Powers Bill the Council ask for powers for the compulsory purchase of land for fire brigade stations, for rehousing in connection with the Clare Market scheme or the new street from Holborn to the Strand, for the purposes of the Technical Instruction Acts, for open spaces and recreation grounds, and to enable burial authorities to provide crematoria; two Bills refer to tramway extensions. The London County Council also intend to ask leave to bring in measures enabling them to purchase or acquire by compulsion or agreement Spitalfields Market, for the construction of a Thames tunnel between Ratcliff and Rotherhithe, with the necessary approaches, and to have conferred upon them the same or similar powers of acquiring land for street improvements as may now be exercised by vestries and district boards in the county. They will reintroduce their measures to bring a supply of water from Wales and to acquire the undertakings of the London companies; and the East London Company propose to ask for powers to make new storage reservoirs, aqueducts, &c. Notice is also given of a measure giving power to the Local Government Board to require the metropolitan water companies to submit schemes for further storage reservoirs in the Thames Valley, and power to the companies to take further waters from the Thames and its tributaries. The South Metropolitan Gas Company proposes to transfer that portion of the undertaking of the Gas Light and Coke Company which is situate on the south side of the Thames in the administrative county to the South Metropolitan Company, on terms that may be agreed between the two companies. The L.C.C. notify their intention of bringing in a Bill to amend the Acts relating to the Gas Light and Coke, Commercial Gas, and South Metropolitan Gas Companies in respect of gas testing, to provide for fixing, prescribing and limiting the charges to be made, and, among other things, to require the companies to issue to consumers statements with regard to the sum charged and the method in which this sum is made up.

Engineering Notes.

Railway Carriage Lighting.—It has been decided to light all the carriages on the London, Chatham and Dover Railway by electricity.

Atherton and Manchester Water Supply.—A Local Government Board inquiry has been held into the application of the local authorities to borrow £1,500 for works of water supply.

Artesian Wells.—At the meeting of the Leiston Rural District Council on Wednesday it was unanimously resolved to provide two more artesian wells at Sawston, and a tender was also accepted for sinking a third well, provided a suitable site could be found.

A new electric ventilator has recently been invented by Mr. R. Mackay, jun., of Glasgow, which claims to have none of the disadvantages inseparable from the use of gas or fire. It is made by Messrs. Cousland and Mackay, ventilating engineers, Glasgow.

Burnley Tramway Scheme.—The Corporation propose to promote a Bill for relaying the Burnley and district tramway, which will come into their possession next year, for providing electrical equipment, and for carrying branch lines into various parts of the town. It is stated that the probable cost of reconstruction and making the proposed extensions will cost about £150,000.

A breakwater formed of natural cement at Marquette (America) has proved a great success, and it is calculated that it will be in good serviceable condition a hundred years hence. Twelve years is the average life of the old wooden-cribbed breakwater filled in with stone. When the work was begun seven years ago many engineers doubted if the natural cement could be used in place of Portland, but experience has proved that, mixed with a small quantity of the latter, it is admirable, so much so, in fact, that the Government has undertaken a much larger work of the same kind at Duluth.

Municipalisation of Cambridge Waterworks.—At a meeting of the Cambridge Town Council some time ago it was resolved by a majority to acquire the University and town waterworks, but it was afterwards ascertained that the majority was not sufficient to satisfy the requirements of the Act of Parliament. The matter was referred to the Council's parliamentary agents, who advised that the vote should be taken again, and a special meeting was accordingly held last week when the vote was carried by twenty-five to seventeen.

Hoylake Water Supply.—The ceremony of starting the new engine for the pumping of water to supply the districts of Hoylake and West Kirby took place on Saturday. Since 1878, when the original works were commenced by the Hoylake and West Kirby Gas and Water Company Limited, the continued growth of the district has necessitated the sinking of new wells and the provision of more powerful machinery for pumping purposes. In 1878 the machinery then employed was capable of lifting 20,000 gallons of water per hour, whereas the new machinery, with the aid of the existing machinery, is capable of pumping 100,000 gallons per hour, or nearly 2,500,000 gallons per day, and this is likely to be adequate for the requirements of the district for some time to come. The directors, in order to keep the works in the highest possible state of efficiency, are now applying for powers to enable them to construct another reservoir capable of holding two million gallons of water, a water tower 66ft. in height, and also to sink another bore hole from the bottom of No. 2 well to any required depth. In their new departure the company have acted upon the advice of their engineers, Messrs. Beloe and Priest, 13, Harrington Street, Liverpool.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
	BUILDING—		
Dec. 8	Aberystwyth, Wales—Four Houses	D. Howell	T. E. Morgan, 12, Baker-street, Aberystwyth.
,, 8	Londonderry—Eleven Dwelling Houses	T. C. Wylie	R. E. Buchanan, Architect, Castle-street, Londonderry.
,, 8	Stotfield, Scotland—Rebuilding Golf Clubhouse	....	A. and W. Reid and Wittet, Architects, Elgin.
,, 9	Spean Bridge, Scotland—Two Villas	....	L. and J. Falconer, Architects, Fort William.
,, 9	Hither Green, S.E.—Sunday School and Manse	Bible Christian Church Trustees	E. J. Hamilton, Architect, 2, New-road, Brighton.
,, 11	Bacup, Lancs.—Bridge Works	County Council	County Bridgemaster, County Offices, Preston.
,, 11	Lochgelly, Scotland—Tenements	Co-operative Society, Ltd.	J. Murray, 233, High-street, Keighley.
,, 11	Settle—Offices, &c., in Town Hall Buildings	....	H. Ross, Architect, Cannon-street, Accrington.
,, 11	Wavertree, near Liverpool—Buildings	....	E. Kirby, 5, Cook-street, Liverpool.
,, 11	Edmonton—Superstructure of Three Cottages	Urban District Council	G. E. Eachus, Engineer, Town Hall, Lower Edmonton, N.
,, 11	Liverpool—Cottage Home School, &c.	Vestry	E. Kirby, 5, Cook-street, Liverpool.
,, 11	Manchester—Reconstructing Houses	Paving, &c., Committee	City Surveyor, Town Hall, Manchester.
,, 11	Rotherham—Retaining and Fence Wall, &c.	Rural District Council	R. Bradbury, 29, High-street, Rotherham.
,, 12	Belfast—Buildings	Ocean, Accident & Guarantee Corpn. Ld.	W. H. Stephens and Son, Donegall-square North, Belfast.
,, 12	Sligo—Alterations, &c., to Infirmary	....	W. T. Vernon, Secretary, Courthouse, Sligo.
,, 13	Leyton, Essex—Infirmary	West Ham Union Guardians	F. E. Hilleary, Clerk, Offices, Union-road, Leytonstone, E.
,, 13	Bangor, Ireland—Residence	Dr. Gorman	J. V. Brennan, Architect, Belfast Bank-chambers, Belfast.
,, 14	Huddersfield—Livery Stables	B. Oxley and Sons, Limited	J. Kirk and Sons, Architects, Huddersfield.
,, 14	Southerndown, Glamorgan—Hotel	W. Powell	G. F. Lambert, Architect, Bridgend.
,, 14	Brighton—Underground Urinal	Corporation	F. J. C. May, Borough Surveyor, Town Hall, Brighton.
,, 14	Croydon—Masonry Clock Tower	Corporation	Borough Engineer, Town Hall, Croydon.
,, 14	Wigan—College	Technical College	Briggs and Wolstenholme, Architects, Richmond-terrace, Blackburn.
,, 15	South Kensington—Foundations, &c., to Victoria and Albert Museum.	Commissioners of H.M. Works and Public Buildings.	Sir John Taylor, H.M. Office of Works, &c., Storey's-gate, London, S.W.
,, 15	South Kensington—Foundations, &c., to Royal College of Science.	Commissioners of H.M. Works and Public Buildings.	Sir John Taylor, H.M. Office of Works, &c., Storey's-gate, London, S.W.
,, 15	Whitley, Northumberland—Council Offices	Urban District Council	J. P. Spencer, 13, Grainger-street West, Newcastle-on-Tyne.
,, 16	Brydekirk, Scotland—Additions, &c., to Public School	....	— Irving, Clerk to Board, Kirtlebridge.
,, 16	Shirebrook, near Mansfield—Lock-up	Standing Joint Committee	J. S. Story, Surveyor. County Offices, St. Mary's-gate, Derby.
,, 16	Abingdon-on-Thames—Hospital	Joint Hospital Board	J. G. T. West, Architect, Abingdon.
,, 18	Fleetwood, Lancs.—Schools	School Board	W. H. Haworth, 15, Mawdsley-street, Bolton.
,, 18	Isle of Thanet—Infectious Diseases Hospital	Joint Hospital Board	Franklin and Andrews, 25, Ludgate-hill, E.C.
,, 18	Romford—Laundry at Workhouse	Board of Guardians	R. L. Curtis, 119 and 120, London Wall, E.C.
,, 18	Willesborough Lees—Hospital Building	East Ashford Rural District Council	H. Hamilton, Clerk, 11, Bank-street, Ashford. Kent.
,, 19	Barking, Essex—Ejector Station, &c.	Urban District Council	C. J. Dawson, Surveyor to Council, Public Offices, Barking.
,, 19	Blaen Llynvi, near Tywith, Glamorgan—Station	Great Western Railway Company	Engineer, Newport Station.
,, 19	Burnley—Extension of Goods Yard, Offices, &c.	Lancashire and Yorkshire Railway Co.	W. B. Worthington, Engineer, Hunt's Bank, Manchester.
,, 19	Birkenhead—School Extension	Corporation	C. Brownridge, Borough Engineer, Town Hall, Birkenhead.
	ENGINEERING—		
Dec. 8	West Ham—Electric Lighting Plant	Town Council	Borough Electrical Engineer, Abbey Mills, West Ham.
,, 8	Dundee—Steam Fire Engine, &c.	Town Council	Sir T. Thornton, Town Clerk, City Chambers, Dundee.
,, 9	Edinburgh—Girder Roof	Corporation Gas Commissioners	W. R. Herring, Chief Engineer, Gasworks, Edinburgh.
,, 11	Woking—Steam Alternators	Electric Supply Company, Limited	Preece and Cardew, 13, Queen Anne's-gate, Westminster, S.W.
,, 11	Bacup, Lancs.—Bridge Works	County Council	County Bridge Master, County Offices, Preston.
,, 11	Jarrow—Steel Foot Bridge	....	J. Petree, Borough Engineer, Jarrow.
,, 11	Manchester—Alterations, &c., at Sewage Works	Rivers Committee	Secretary, Rivers Department, Town Hall, Manchester.
,, 12	Birkenhead—Overhead Travelling Crane, Mains, &c.	Corporation	W. Bates, Borough Electrical Engineer, Birkenhead.
,, 12	Dover—Water Mains	Town Council	H. E. Stilgoe, Borough Engineer, Town Hall, Dover.
,, 12	Ilford—Pumps, &c.	Urban District Council	J. Taylor, Sons, & Crimp, 27, Gt. George-st., Westminster.
,, 12	Worcester—Storm Water Conduit	Corporation	T. Caink, City Engineer, Guildhall, Worcester.
,, 12	London, S.W.—Hydraulic Machinery, &c.	London County Council	Engineer's Department, County Hall, Spring-gardens, S.W.
,, 12	London, N.E.—Refuse Destructors	Hackney Vestry	R. Hammond, 64, Victoria-street, Westminster, S.W.
,, 13	Rushden. Northants—Sinking Well	Urban District Council	J. Eunson, Engineer to Council, Northampton.

Property and Land Sales.

FREEHOLD BUILDING LAND to be LET on LEASE, or SOLD in PLOTS; fronting on main road, and close to golf links and Highgate Woods; near Muswell Hill and East Finchley Stations. Liberal advances if required to responsible Builders.—For plans and particulars apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington Road, N. 9

REID'S BREWERY, Clerkenwell-road.—Further sale of the materials of this extensive pile of buildings.

MESSRS HORNE and CO. (in conjunction with Messrs. CHINNOCK, GALSWORTHY, and CHINNOCK) are instructed to SELL by AUCTION, in Lots, on the PREMISES, on Tuesday, December 19th, at Half-Past Twelve o'clock Precisely, the BUILDING MATERIALS of a very large Block, including Nos. 3, 10, and Middle Stores, extensive ranges of Malt and Hop Lofts, and Nos. 2 and 3, Ponto and Tun Rooms, including sound stock brickwork, excellent slates, timber, roofs and floors, heavy baulk girders and uprights, w. i. fireproof and other folding and sliding doors, c. i. tank, 24ft. by 33ft. by 3ft. 3in. flange and socket pipe, turned shafting, friction hoists, steel conveyors, several hundred tons of cast and wrought iron in useful girders and columns of various descriptions, granite paving, pitching, many tons of lead, also a quantity of loose brewery utensils, brads, screws, bolts, nuts, scaffolding, ladders, deals, firewood, &c. May be viewed on and after December 14th.

Catalogues had of Messrs. HORNE and Co., 8, Delahay-street, S.W., and 85, Gresham-street, E.C.

FINE SITE FOR WORKS.

FOR SALE, about 10 Acres of FREEHOLD LAND, with good road frontage, and adjoining the London and North-Western Railway Station, in an improving Midland town and colliery district; canal close to; good labour market.—Apply to GEORGE LOVEITT and SON, Estate Agents, Coventry.

SOUTH KENSINGTON.—Important Freehold Building Site, specially suitable for the erection of residential flats, and occupying an area of about 18,500 superficial feet.

By direction of the Executors of the late Captain Nisbet, deceased.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY and CO. will SELL by AUCTION, at the Mart, E.C., on THURSDAY, DECEMBER 14th, 1899, at TWO o'clock precisely, the valuable FREEHOLD old-fashioned RESIDENCE and GROUNDS, known as "Hollywood Lodge," Hollywood-road, having a frontage thereto of 104ft., and a return frontage of 173ft. to Fawcett-street, and occupying a commanding corner position, about half-a-mile from Earl's-court and South Kensington Railway Stations, and close to the Fulham-road, and in direct communication with the West End and City omnibus route. With possession.

May be viewed, and particulars, plan, and conditions of sale obtained of Messrs. SANDILANDS and Co, Solicitors, 12, Fenchurch-avenue, Fenchurch-street, E.C.; at the Mart, E.C.; and of Messrs. FAREBROTHER, ELLIS and Co., 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

SALE DAYS for the Year 1899.

Messrs.

FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, Dec. 7 | Thursday, Dec. 14

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

HARROW-ON-THE-HILL.—Three acres of eligible Lands abutting on main road, laid out for small villa or cottage residences, five minutes from town and schools and proposed railway station, TO BE LET on Building Lease, or FREEHOLD will be sold. —For terms and particulars apply to BENTWICH WATKIN WILLIAMS and GRAY, Solicitors, Corporation-chambers, Guildhall-yard, E.C.

STREATHAM.—Norfolk House Estate.—Important and valuable Freehold Property, with possession, containing about 15 acres and 24 perches, with frontages to main roads, and offering unequalled advantages for development as a building estate. By order of the Trustees under the will of the late Christopher T. Gabriel, Esq.

MESSRS. G. A. WILKINSON and SON will SELL by AUCTION, at the MART, on TUESDAY, DECEMBER 19th, at TWO precisely, the important and very valuable FREEHOLD PROPERTY known as the Norfolk House Estate, Streatham High-road, a magnificent position on high ground, within five minutes' walk of Streatham Hill Railway Station, about five and a half miles from the Royal Exchange and five miles from Charing Cross. The property, which has frontages to Streatham High-road of 589ft.; to Mount Ephraim-road of 530ft.; and to Mount Ephraim-lane of 974ft., is compact and capable of immediate development for superior residences, which are much sought after in this favourite suburb. There is an excellent mansion at present on the property, approached by a carriage drive, with lodge, and containing three reception-rooms, thirteen bed and dressing rooms, bath-room, and good domestic offices, stabling for four horses, beautiful pleasure grounds, ornamental lake, with boathouse; greenhouse, three vineries, &c., kitchen gardens, orchard, and park-like land, the whole containing about 15 acres and 24 perches.

Particulars and plan are now ready, and may be obtained of Messrs. MILLINGTON and DREW, Solicitors, No. 14, Great Winchester-street; and of the AUCTIONEERS, 7, Poultry, City.

WM. HOWIE,

REGISTERED SANITARY PLUMBER,

67, ARCHWAY ROAD, N.

(Late of 15, Garlick Hill, E.C.)

Supplies Architects and Builders with Estimates for carrying out High-class Plumbing and Sanitary Work, Stoneware and Iron Drainage.

YOUR ENQUIRIES WOULD BE ESTEEMED.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

MODELS.
For Exhibitions or Law Cases.
Illustrations sent of Work Executed.

THE AUTHORITY OF

"SPECIFICATION."

Extract from the Correspondence Column of the "Building World," Sept. 2nd, 1899:—

[2877] YORKSHIRE SLATES.—J. D. (*Ilkley*) writes:—"Please explain, in the form of a specification, how a roof should be slated with Yorkshire slates. Should the lap be more than 4in.? and how are the edges dressed for a first-class job?"

— A general specification of good slating will be given in the solution to question 64 in the Honours Building Construction, which will shortly appear in "Building World." Yorkshire slates, or grey slating, is the name given to the thin flags or tile-stones, or stone slates, largely used for roof coverings in the northern counties. They are generally from ½in. to 1in. thick, and hung to the battens by wooden pegs about 3in. long, and laid close. Owing to their weight they require heavier rafters or spars, but they are very efficient in maintaining the rooms below at an equable temperature. The clauses relating to such a roof are given in **Specification** as follows: "Cover the roofs coloured . . . on plan with . . . stone tiles, best quality, laid to a 3in. lap at 45° pitch, with diminished courses from eaves to ridge, a double course at eaves, and dressed to hips, valleys, and verges, properly bonded in every part, and shouldered up in lime and hair mortar. The tiles to be fixed with oak pegs on to 1½in. by ½in. sawn oak laths spiked to rafters. Perform all cutting and labour. The verges to be bedded and pointed in cement. The valleys to be formed with stone tiles worked to an angle. The hips and ridges to be formed out of solid sawn stone, 9in. wide on each splay, in lengths of not less than 3ft., bedded and jointed in cement, with solid-cut junction pieces. The lowest hip stones to have strong wrought-iron stays."—HENRY ADAMS.

SPECIFICATION No. 4 is still on sale at all Booksellers and the Railway Bookstalls, Price 5s. nett, or from the Publisher, 5s. 6d. post free.

An Architectural Causerie.

The Sheep of Architecture.

Surely architects are in their habits the most conservative of men. Two hundred years ago it became an established rule that no architect was fully educated in his art who had not been to Italy and seen St. Peter's and the Pantheon, and this notion we have accepted without question, though very many things, some of them as I think material to the matter in hand, have happened in the meantime. Because Inigo Jones and the great classical architects who succeeded him all advocated Italian study, we must do the same. Now it has always seemed to me a strange thing that we should go on thus unreflectingly in the steps of our predecessors. A tour in Italy is truly one of the most delightful experiences a man can have; there are mountains and valleys, lakes and rivers, pictures and statues, sunny skies and ancient cities; but why should the enjoyment of these good things be thought of peculiar service to architects? It is not to them particularly, but to men of all professions that a visit to Italy is an education.

Of course, you can understand well enough that Inigo Jones and Wren could not be happy without going to Rome and studying that class of buildings which had, up to their time, been produced in their completeness only in Italy. Being convinced that the high Renaissance style was the one to adopt, they naturally desired to visit a land where that style had been most completely developed; and seeing that they recognised this style to be derived from another one—that of ancient Rome—they wished to see the models after which the style they admired had been formed. And, accordingly, when they reached Italy, their attention was chiefly directed, I take it, on the one hand to the remains of ancient Rome, the Coliseum, the Pantheon, and so on; and on the other to the works of Vignola and Palladio, or of Michelangelo and the other architects of St. Peter's. They were always in search of the grandiose, or of the elegant, and orders and entablatures, cornices and attics, domes and porticos, were the objects of their interest. But seriously, how much do modern architects care about the grandiose and the elegant? Municipal bodies, truly, will have the grandiose if they can; but, after all, most of us travel to see what is pleasing to ourselves, not to our clients, whether actual or prospective. Consequently, when we go to Italy we usually find, in my opinion, that the works which aroused enthusiasm in Inigo Jones, or Wren, awake in us but a languid interest. I rarely meet anyone who says that he receives real pleasure from the contemplation of St. Peter's, and as to Palladio's St. Giorgio at Venice, its effect, save from a distance sufficient to obliterate most of its features, is depressing in the extreme. What we go to Italy for nowadays is the work of the early Renaissance; the Cancelleria at Rome, or the great Florentine palaces, or the tombs in Sta. Maria del Popolo—the South Kensington style, in short. There are some who, using the eyes of Ruskin, see the perfection of architecture in Italian Gothic. Of this work—both the early Renaissance and the Gothic—we feel that it is genuine; that is to say, its originators felt and enjoyed its beauty; while of the later buildings, St. Peter's or St. Giorgio, we half feel that they are made to impress the public with the designer's skill, or learning, or sublimity, and instead of being easy, natural and unpretentious, they are aggressive and unsympathetic. In fact, a great change has come over the view which appreciative people take of architecture in Italy. At the present time, before admiring any work, we make a condition—rightly, as I think—that the work must show the author's delight in it. He may not have achieved his ideal, but it must be evident that the effect he was striving for was one which gave him a direct sensation of pleasure; otherwise, we put him down as a poser, a rhetorician in art. But Inigo Jones and Wren were not so particular on this point. Their art is imposing rather than sympathetic, so that it is inevitable that we should fix our interest on objects to which they gave but little attention.

The old notion, therefore, that it is essential for all architects to go to Italy wants overhauling; Wren and Jones believed it because they found there certain buildings which they wished to examine and imitate. We do not want to imitate these buildings any longer, so why should we follow one another to Italy like a flock of sheep? Truly there are many beautiful buildings in Italy besides those of the high Renaissance; but are they just the works that we want to study? Personally, I fancy the early Renaissance work too refined and too exquisite to be of much use to us with our climate, our materials, and our tastes; and the Italian Gothic strikes me as something a little awkward and brutal. Many persons will no doubt disagree; let them, being certain of what they like, go to Italy and study it. But it should not be taken for granted that architecture is at its best in Italy; let us think for ourselves and realise clearly what gives us pleasure and what does not, without deferring to the authority of Inigo Jones, or Wren, or Ruskin; even degenerate moderns like ourselves have a right to our own judgment and an obligation to use it.

REREDOS IN THE CHURCH OF ST. BARNABAS, CLAPHAM COMMON, S.W. W. AND C. A. BASSETT-SMITH, ARCHITECTS. THOMAS RUDGE, SCULPTOR.

Reredos at St. Barnabas Church.

The elaborately carved reredos illustrated on this page has been erected in the new church of St. Barnabas, Clapham Common, London, S.W., recently opened by the Bishop of Rochester The reredos is of Caen stone, inlaid with polished alabaster panels, and is of the early decorated style. The portion representing the "Lord's Supper" is carved out of one solid piece of stone, the weight being over one ton as finished. The work was executed by Mr. Thomas Rudge, sculptor, of Webbs Road, Clapham Common, S.W., from designs submitted by the architects, Messrs. W. and C. A. Bassett-Smith. Mr. Rudge had all the carvings of the church entrusted to him. Our illustration is from a photograph by Mr. S. Applegarth, of 119, Lavender Hill, S.W.

Chimneys, Great and Small. LONDONERS who value their great waterway, the Thames, and appreciate its architectural possibilities, have noticed of late a large increase in the number of chimneys on the Surrey side of the river; tall and short, square and round, some bearing advertisements and all adding their quota of smoke to the murky air of London. From various causes they are increasing in other parts of the city, often in the most unexpected places, cleaving the air beside a church spire or towering up a few yards behind a fashionable street; in short, they enter into all views of London to an extent which was unknown a few years ago. The ordinary house chimney is, of course, to be seen in tens of thousands, and its effect is to mar the skyline of many buildings, giving a ragged, confused look. In a country where open coal grates are universal, or very nearly so, the chimney, one would think, should be treated as an honoured feature of every design; yet how little is it actually considered! It is unfortunate that Mr. Ruskin should, many years since, have lent the weight of his name to a theory that chimneys, being purely utilitarian, must necessarily be ugly. This is on a par with his bitter objection to any attempt at softening the harshness of a railway station; it is "the very temple of discomfort," he says, therefore let it remain so. But such a theory is opposed to the whole history of architecture, where, in every age, beauty and use have gone hand in hand, and in none more than the fifteenth, sixteenth and seventeenth centuries in England, when our domestic buildings were at their best. In those centuries, more especially in the sixteenth, chimneys were prominent and beautiful features of most designs, generally in clusters, carefully planned to turn their angles to the spectator, their long stalks sometimes ornamented, ending in spreading tops. It is to the eighteenth century that we owe the decay of this useful and picturesque feature and the growth of "chimney-pots." In modern times our architects have struggled as well as popular ignorance and public niggardliness would allow to revive the rational treatment of the chimney question. Two excellent modern examples may be mentioned: one in the City, the National Provident Institution at the corner of Gracechurch and Bishopgate Streets, the other in the West End, to wit Grosvenor Gardens. Both are notable, too, as showing that the system is not necessarily confined to Tudor or Elizabethan. The tall factory or commercial chimney at first sight might seem unsuited to artistic design, but it is not so, and one illustration proves it. Looking across the Thames the most satisfactory object on the further bank is the old Shot Tower, a favourite subject with artists; though not itself a chimney, it serves to show that a plain structure in the form of a chimney in simple brick can yet be effective and pleasant to the eye if only its proportions be good and the outline diminish gradually to the top. Upon that outline all depends, and how small a thing is it to require a modicum of taste in this. Isolated as all but the lowest part of a great chimney is, and very narrow for its height, it presents some difficulties to the designer, but Europe is full of beautiful examples of high tapering structures whose outline might serve to some extent as a model in such cases; the older campaniles of northern Italy at once suggest themselves, and the light tapering minarets of Eastern countries; both are very often found in the simplest materials, and with very little detail.

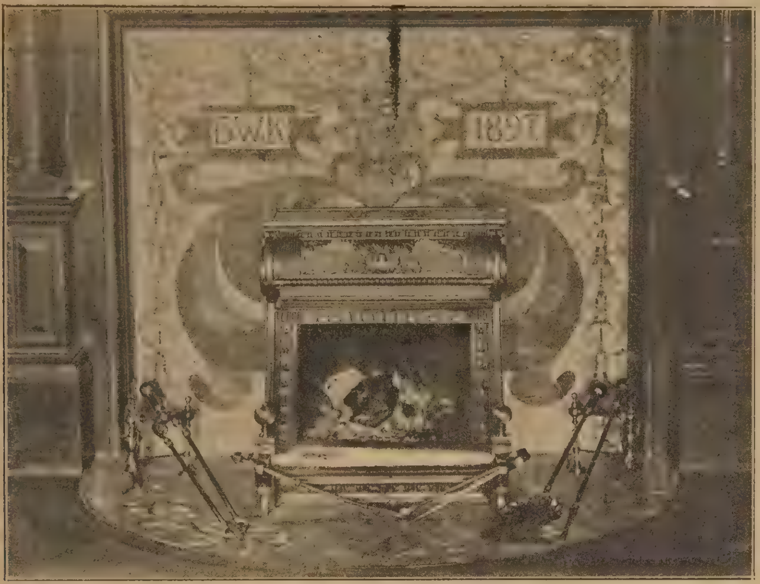
J. C. P.

On Reflection.

Lighting Reforms. Two matters relating to artificial illumination which need reforming are the design of street lamps and the lighting of shop windows. Speaking generally, the question of street lamps is confined rather to those using gas, as the electric standards come under the newer influences and are very often of highly meritorious design. The gas lamp has more often than not a crude and harsh appearance. Not only is the cast-iron standard itself either too heavy or pinched in with the idea of ornamenting it, but the lamp seems to be the production of the unenlightened shopman animated by no other purpose than the duplicating of an accepted form with the greatest profit to himself. As an example of what can be done in this branch of design, the lamps on the Victoria Embankment may be mentioned, for not only are they emblematic of their surroundings, but the design is a sturdy one, having a good broad base and tapering gracefully to the globe. It would, of course, be absurd to demand that all street lamps should be equally good, for the cost of making the Embankment lamps was greatly in excess of what ordinary corporations would be prepared to pay for their own lamps; but still the reference serves its purpose—to draw attention to the urgent need of better design in this direction. While speaking of street lamps it might be well to refer to those cut-glass monstrosities which seem to be the special outside feature of the modern public-house. Their cost is high, but they never enhance the appearance of the street they overhang. With regard to the illumination of shop windows, it should be remarked that "point" lighting ought not to be aimed at (though in nine cases out of ten it is), for it is not the lights, but the goods that require to be seen. The truth of this remark will be forcibly brought home by comparing a jeweller's shop window that has electric lights stuck here and there around it in full view and one in which the light streams softly down from the top, augmented, it may be, by shaded lights at the front. Clear points of light are needed in some places, but not in shop windows, and the objection becomes increased ten-fold when an electric arc lamp is introduced, producing what is perhaps the most objectionable of all effects in shop lighting. Diffusion should be the object, for we feel certain that in the next century the prevalent custom of "point" lighting will be replaced by one in which a universal glow and softened radiance will be the two most prominent qualities.

A German View of Ruskin. WE said the other day in these columns that it was interesting to know what one nation thought of the works of another, and an article by a competent German art critic on Mr. Ruskin's influence and views, published in the current number of the Berlin "Nation," may be cited in this connection. The criticism is more interesting from the fact that until quite recently Ruskin's works could not be obtained in the German language, and, consequently, he was comparatively little known in Germany. The note which the critic sounds tends chiefly to point to our great prophet as a moralist who "clothed his moral teaching in the garb of æsthetics," and though the validity of his theory might be open to doubt, his influence has been strong and far-reaching. Ruskin is, however, called inconsistent or illogical in his naturalism, for on the principle that true art is worship he would have only the good in nature selected and imitated, and would make everything subordinate to a very strenuous theory of morals. This is where the German critic's allegation of inconsistency comes in, and he regards as narrow prejudices Ruskin's dislike for the nude in art and preference for landscape, prejudices which he ascribes to an English birth and training. But he admires Ruskin's enthusiasm, his love for nature, and his wonderful powers of expression, and points out the difference between his art teachings and those of Tolstoi. The Russian Count said, with the idea of reducing the argument to an absurdity, that if his friend were right even wall-papers might be works of art. Ruskin, of course, would gladly admit that possibility, and rightly so, for no one who has any knowledge of paper-hangings and their possibilities would deny that they could be works of art. William Morris himself—Ruskin's "truest friend and disciple," as the critic puts it—"became a designer and manufacturer of wall-papers, and we owe it to him that nowadays simple middle-class houses have walls more beautifully decorated, almost, than those of king's palaces used to be."

A Bad Case of Vandalism. THE Cathedral of Milan has one façade, dating from the sixteenth and seventeenth centuries, which has been declared by some to be out of accord with the rest of the building, and, therefore, offending. A worthy citizen of Milan who held this opinion died in 1884 and bequeathed about four hundred thousand lire towards the building of a new façade, but he attached the proviso that the work should be commenced within twenty years of his death. A competition was held, in which architects from all parts took part, but it proved unsatisfactory and, as the result of a second competition, the designs of a young Italian architect named G. Brentamo were accepted in 1888. It appears that an attempt was made to begin the work at once, but the architect died suddenly and this upset matters to such an extent that nothing has been done since, and as there only remain a few years of the stipulated limit of twenty, the cathedral authorities are beginning to feel anxious about their restoration, especially as it has been found that the legacy will not nearly cover the expenditure entailed. The artists of Milan, supported by many of the newspapers, are all against having the old façade touched, which, out of keeping or not, is a fine piece of work. This view of the case has no more zealous supporter than the eminent architect Signor G. Beltrami. He says:—"This great monument, which occupied many centuries in building, bears the stamps of various ages, shows traces of all the generations which in succession bestowed their labour on it. Each epoch has contributed its share, for good or ill, until our Duomo has become, so to speak, the visible record of the arts throughout the centuries. Unpardonable, therefore, would it be to lay a desecrating hand upon it, or to attempt to modify it with the object of arriving at that unity of style which it cannot possibly possess. Moreover, as the façade now exists, so we have always seen it, so we have learned to love it, with all its beauties, all its faults. Time has laid a colouring hand upon its stones, and clothed them with that mysterious harmony which no human skill can replace or imitate, should this contemplated crime ever be committed." Presuming this to be a fair view of the case, we certainly agree that the substitution of a new façade would be a gross act of vandalism, and in this age of "restorations" the cry of "hands off" the old buildings needs to be taken to heart by all concerned, for too often the hand that touches mars and withdraws for ever the charm and beauty which Time alone can give.



FIREBACK AND HEARTH AT "BENNETTHORP," EALING. DESIGNED AND WORKED BY G. BRIDGE. A. SYKES, A.R.I.B.A., ARCHITECT.

MOSAIC.

DESIGN AND WORK.

By GEORGE BRIDGE.

(Concluded from page 160, No. CCXLV.)

THE best position for a mosaic upon a wall, internal or external, is where it can be granted the largest amount of space consonant with the design of the building: although, however large the mosaic, it must of course be treated as a subordinate part of the architectural scheme. Indeed, in buildings where mosaic is not confined to certain spaces enclosed by architectural constructional features, but is allowed to spread over pilasters, ribs and mouldings, the general effect is cheap and tawdry. Mosaic looks richer in colour and more sumptuous as a decoration when it is framed by the naked building material of which the structural portions of the edifice are composed, be it marble, stone, or brick.

The mosaic worker must make the general colour of his mosaic subservient to the colour of the building, of which it is only a part; it is ridiculous to alter or design the building to the mosaic. The roof of the choir in St. Paul's Cathedral has a very tinselly effect. The indistinct mosaic designs have gold mosaic backgrounds, and all the surrounding architectural features have been covered with gold leaf, the whole forming a general mix-up of smudges of colour and tawdry gold.

Designers for mosaic very often make the great mistake when colouring their sketches that gold mosaic is the only background for their design, whether it be figures or ornament; it is a very easy way of getting over the difficulty of thinking out a fuller colour scheme to make a sketch and to write gold background upon it. The material is more expensive than the ordinary mosaic material, and it may be more satisfying to the client to have a little design and plenty of gold about his building, but much richer effects can be obtained by using appropriately coloured backgrounds, and only using all lustre materials (golds, silvers, rubies, &c.) where they will help a figure, like jewels, clasps, &c., upon draperies.

Mosaic has almost always been looked upon as quite unfitted for the external decoration of buildings in London and other large English cities; the primary reason for this studied neglect is stated to be that the chemical action of certain atmospheres—the smoke and the soot—tends to obliterate the colours of the material. The same reasoning might be applied to all carvings in marble or stone; the material will not keep to the original startling white after a few months of London atmosphere.

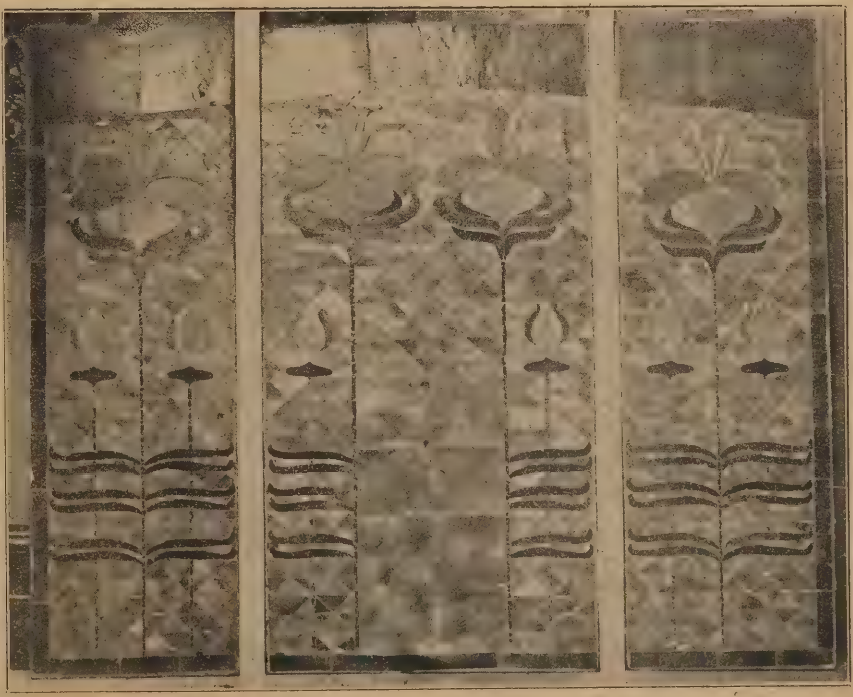
If mosaic were only given more trials as external colour decorations, and the designer and worker were given an absolutely free hand as to the strength of colour used, it would be found that if the colour when applied showed a slight tendency to crudeness, whatever dirt was deposited would simply rectify the crudeness and soften and sweeten the whole mosaic.

There are not overwhelming evidences of dirt upon the mosaics in the Albert Memorial, and they have been exposed to the London dirt for something over thirty years. In London mosaic has seldom been given a chance to display its full powers externally or internally; an architect is generally loath to grant but small patches of space upon his building to the mosaic worker; these are generally sketched showing thin curly wire-like ornament upon them, and the finished work in position can show none of the chief characteristics of mosaic. The panel might just as well be filled with a slab of granite for any special colour effect gained. The space granted for work of this description should certainly be large enough to allow the designer plenty of scope to design his mosaic in large decided masses of colour, big in general treatment and in detail. The drawing also should be very strong and marked in the design, and of course the higher the position of the mosaic the more decided and emphasized must be the drawing, colouring and details of anatomy, drapery and ornament; indeed these must be insisted upon and slightly exaggerated to suit position. The outlines should be squarer and more sharp and angular the higher the position, as if the drawing has only the normal outline the drawing will appear very weak, the distance tending to enfeeble all detail in a decoration.

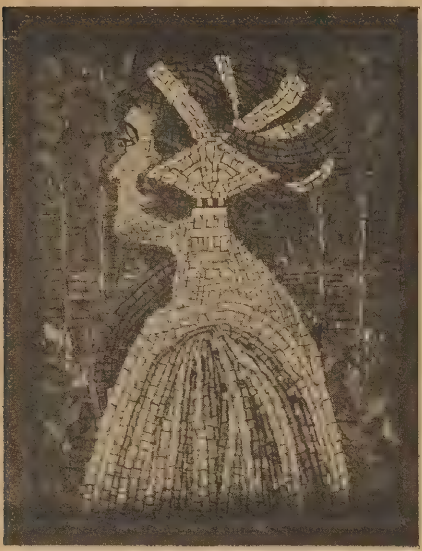
As to design for mosaic, it is not sufficient to take a design for some other material, such as stained glass, and think that it will be good enough for mosaic. The drawing must be thought out and worked up to suit the material. Neither will it satisfy the end in view to drape a model and make a coloured drawing of it, and, after placing a nimbus round the head, to label it with the name of some saint. To paint a picture and deliver it to the workman with instructions to copy it shows a great want of knowledge upon the part of the draghtsman. The man who can only paint pictures is not the one to be entrusted with the commission to draw for any of the applied arts—picture painting is only one of the means to the end in designing for decoration.

The artist should be a designer and decorator to be competent to work out a scheme for any such permanent material as mosaic. Any weakness of drawing would be emphasized in the work, and it would become an everlasting monument to inability, and a standing epitaph to misapplied material. Surely the more durable the material to be used to form a decoration the greater should be the artist employed to execute it.

It is curious to contrast the ignorance of the laws governing decorative design displayed by the majority of modern artists who have drawn for such a permanent material as mosaic with the great knowledge in evidence daily shown by artists who produce such perishable productions as posters. The former have not troubled to learn anything of the craft they are working for; the latter produce masterpieces in the narrowest of limits as to design and reproduction. A first-rate poster designer is very nearly akin to the mosaic artist. They both should gain their object by the simplest means. The poster designer limits the number of blocks to be used, and



FIREBACK AND CHEEKS AT "TANGLEWOOD," GODSTONE. DESIGNED AND WORKED BY G. BRIDGE. C. W. MARSHALL, A.R.I.B.A., ARCHITECT.



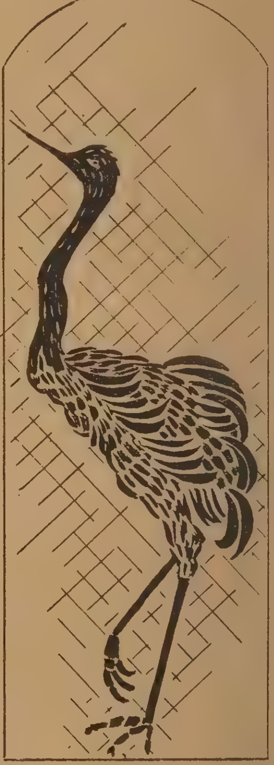
DECORATIVE PANEL AT THE "HAYMARKET" THEATRE, LONDON. DESIGNED AND WORKED BY G. BRIDGE.

the mosaic worker limits the number of colours. The main idea should convey its meaning in a direct and distinct manner—standing from the background—in both arts, and the whole composition should be as decorative as the subject will allow.

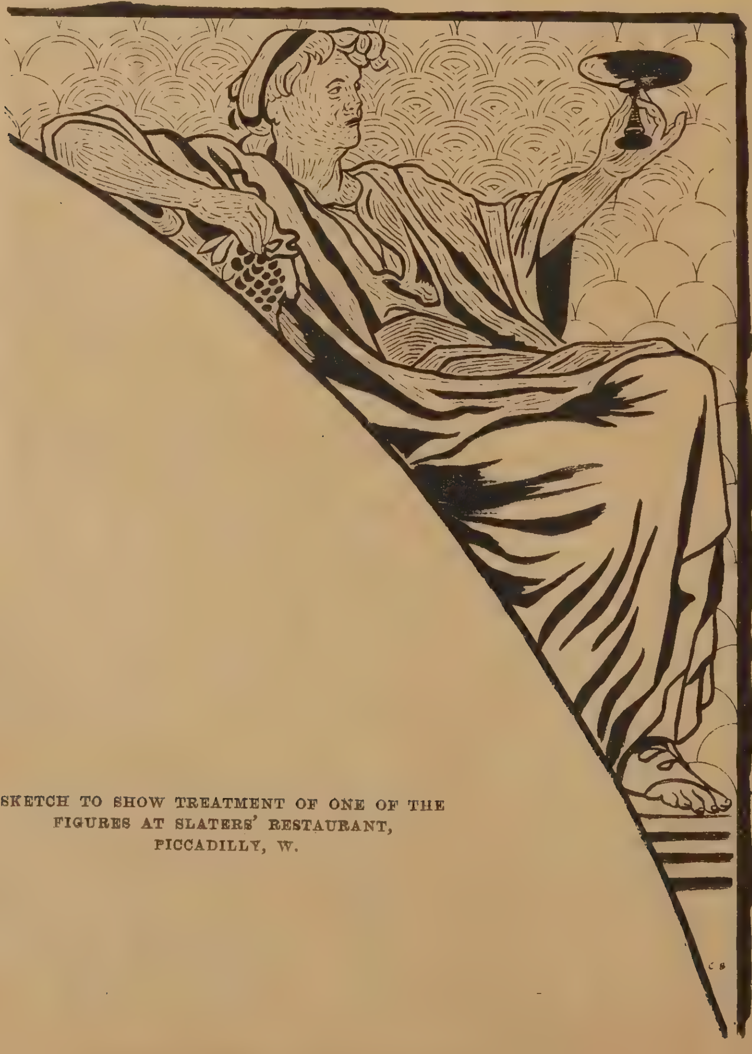
Regarding the details and general treatment of portions of a design, they all require defining according to the position of the work. Outline need not be apparent when the finished work is to be placed within 2ft. or 3ft. of the spectator, and it can be used or dispensed with, according to the value required by parts of the design at all heights. Of course, at about 20ft. the outline is very useful, although scarcely perceptible from the ground, and the higher the mosaic is placed the broader and blacker can be the outline. Ornament at all heights receives additional sharpness and life by the use of a decided outline. Against a gold background a very decided outline should be used. Black will never be too strong, as gold tends to take the strength out of all colours that are used against it.

Ornament ought to be worked in very crude colours, as at heights above 10ft. or 15ft. beautiful dark purples tell only as black, dark rich greens are only smoky-looking colour, blood-red becomes almost Indian-red in tone, rich blue becomes slatey, and fine chromes look like brown paper. To counteract this the worker introduces lines of other colours to lighten the ones in use, white and yellow into greens, or lighter greens with dark tones, lines of cobalt into Prussian blues, yellow with red, while yellow may be toned with lighter tints, and also white may be introduced; in fact white will be found useful for lightening most other tints, it will liven them up and take away the drabness that distance must give to them. Lighter portions of ornament, where they come upon the main body of colour, as in turnovers to leaves, &c., may be outlined and emphasised with white.

In figure work the hair can be suggested in the design as one tint, as the workman can give the necessary "go" to it by the direction of his lines of tesseræ, and can break it up with lighter lines where they will help the general effect. He may define them into locks but only in a broad manner, the whole telling from below as a patch of colour. The same may be said of the flesh. At a height it will all require outlining, the face, hands and fingers, &c.; but the whole should be regarded as one of the colours in the decorative scheme, and one flat tint is sufficient to suggest in the design, and quite enough spirit and modelling will be given to the mosaic by the direction of the lines of tesseræ, with, perhaps, a slight change in tone here and there merely to break up the surface. If any attempt is made to place glass into the mosaic of a decidedly realistic flesh tint, the finished figure will have a complexion like that upon the wax models in the tailors' windows. The tones should certainly approach to yellows and drabs rather than to pink. There was a great deal of mosaic shown at "The Grafton Galleries" in the middle of the year by an American firm, where this mistake was made in several instances, the flesh being quite naturalistic, with a great deal of pink introduced on the faces, giving quite a Madame Tussaud look to the various groups. Flesh must be treated as a portion of a mosaic decoration, not like a coloured photograph.



ONE OF SIX PANELS AT SLATERS' RESTAURANT, LUDGATE CIRCUS. WORKED BY G. BRIDGE. C. R. GUY HALL, A.R.I.B.A., ARCHITECT.



SKETCH TO SHOW TREATMENT OF ONE OF THE FIGURES AT SLATERS' RESTAURANT, PICCADILLY, W.

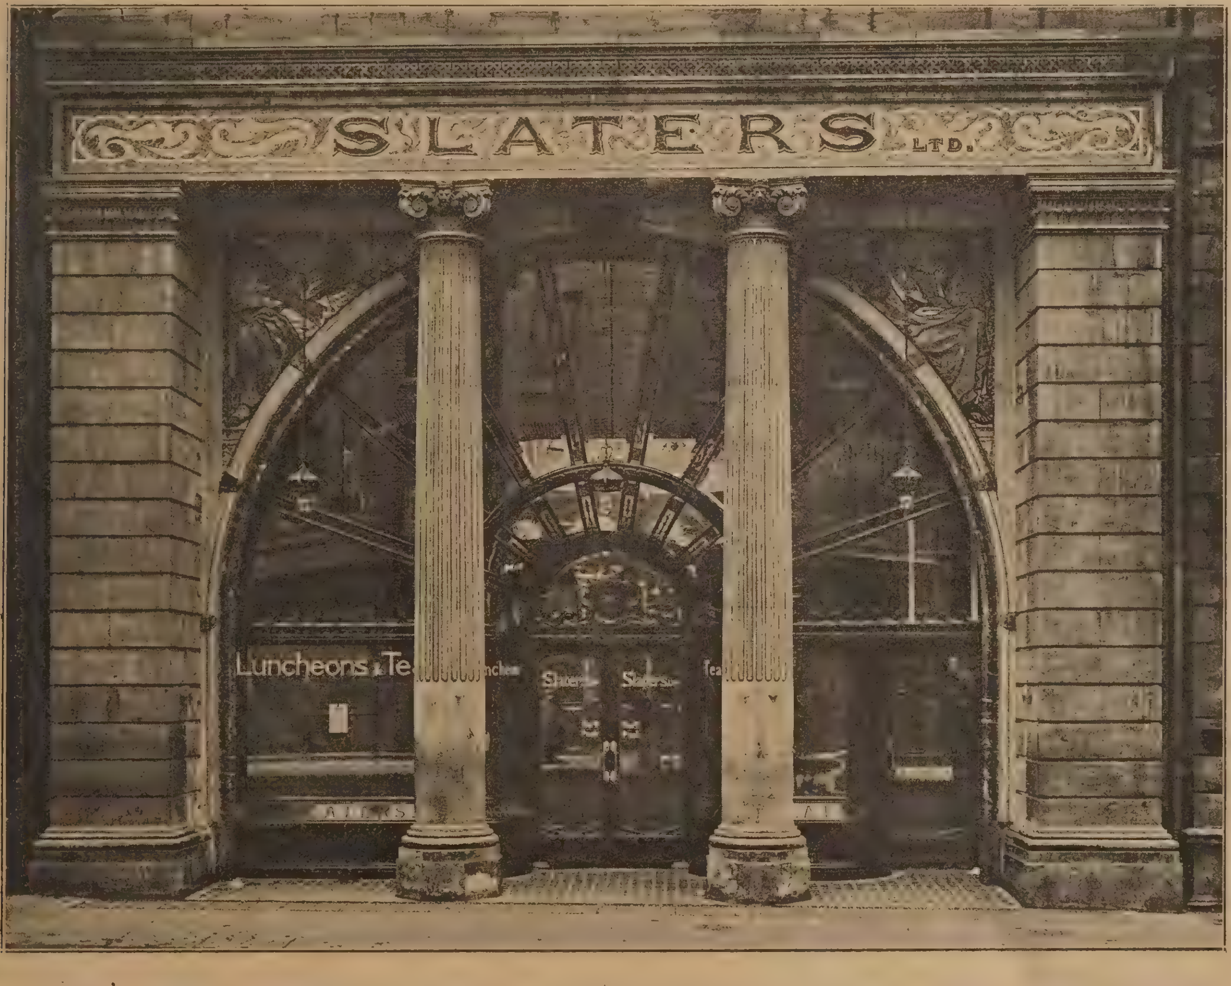
Drapery should be designed so as to obtain folds in large masses of colour; the light and shade should be obtained by the use of two tints of each colour, or two colours in harmony, or even by two contrasting colours; of course, it can be left to the artist to enrich his design by the addition of girdles, trimmings, &c., in which gold, silver and jewels can be shown. The main lines should be big and broad in the handling, and all small folds and detail should be avoided, as they only worry the general design.

The student who desires to study mosaic design cannot do better than to devote his attention to work in position, good or bad mosaic—something can be learnt from both. If he can get to Italy he will not require to give much time to examples elsewhere. There he will find mosaics of all descriptions, good and bad old work, and sometimes good and very often indifferent modern examples.

There is positively no reason to accept every old example as good mosaic; the large copies of pictures outside St. Mark's, Venice, for instance, ought never to have been rendered in mosaic. Again, because there are evidences of very rough work and very open joints in certain positions, it does not follow that in every mosaic, no matter where placed, the work must be executed in a similar manner. It must be remembered that age will cause wide joints to recede from the face a little by a slight contraction, and thus leave a somewhat wider opening and a rougher surface, and also, although in St. Mark's, where the work is about 200ft. high, it is in some cases so rough that the tesseræ stand out ½in. and ¾in. from the cement, it is kept much flatter lower down. Besides, the old workers had different methods, and the student can see where they succeeded and can, when designing and working his own mosaic, assert his own individuality while using the knowledge gained by observation.

When visiting St. Paul's Cathedral and the Albert Memorial, it is as well to provide a field glass, which doesn't say much for the design being appropriate to the height, but still it is a fact that the detail in many cases is muddled and impossible to make out. Of course, this does not apply to the splendid designs under the large dome by Watts, Stevens, and other genuine decorators.

It is curious to notice how Sir W. B. Richmond has been learning mosaic work while employed at St. Paul's. The earlier work is almost undecipherable owing to its being so weak in colour and drawing, but the work has been increasing in strength of colour until in the last portion unveiled, the south-west quarter dome, the work, if anything, is too hard in colour. The work in general seems too undefined and not severe enough for the building, the drapery in most instances being cut up by the use of gold and silver as high lights, and when the backgrounds consist of the same material the figures have the appearance of the backgrounds coming through them. In fact the panels are, even when seen through a field glass, hopelessly muddled in design.



SLATERS' RESTAURANT, PICCADILLY, W., SHOWING TWO MOSAIC FIGURE PANELS DESIGNED BY ALFRED DRURY AND WORKED BY G. BRIDGE. C. R. GUY HALL, A.R.I.B.A., ARCHITECT.

A Lunatic Asylum near St. Albans is proposed to be erected by the Middlesex County Council, but is greatly objected to by the local authorities, who say that such a building would spoil the picturesqueness of the place.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Examination held by the Society of Architects in April, 1899.

By G. A. T. MIDDLETON and R. W. CARDEN, Associates R.I.B.A.

(Continued from page 244, No. CCL.)

VIII.—SANITARY SCIENCE, &c.

1. *Explain the difference between a "hard" and "soft" water, and institute a comparison as to their relative suitability for general domestic purposes. What is meant by "temporary hardness" and "permanent hardness" as applied to waters?*

Soft water is pure water, such as is considered suitable for a domestic supply, that is, water containing not more than 0·02 parts of organic nitrogen, or 0.2 of organic carbon in 100,000 parts. Hard water is water containing salts of lime and magnesia, principally sulphate of lime, carbonate of lime, sulphate of magnesia, and carbonate of magnesia. Temporary hardness occurs in those waters in which the hardness is due to the presence of *carbonate* of lime or *carbonate* of magnesia. It is described as "temporary" because boiling renders the water soft. Permanent hardness occurs when the hardness is caused by the presence of *sulphate* of lime or *sulphate* of magnesia. Boiling the water is ineffectual. A perfectly soft water is unpalatable.

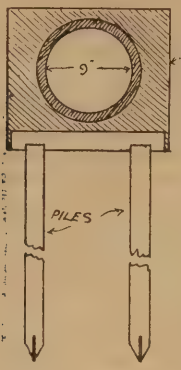
2. *Give particulars of the materials, nature of joint, and general method of construction you would adopt for a 9in. diameter drain laid in water-logged ground when the bottom of the trench is* (a) *compact gravel,* (b) *running sand. Illustrate your reply with sketches.*

In case (*a*) the drains being laid in a good bearing soil, 9in. diameter stoneware pipes (Doulton's "tested" or other approved types) might be used, jointed with Portland cement; the cement to be of good quality, weighing 112lb. per bushel and passing 90 per cent. through a sieve of 2,500 meshes per square inch. In case (*b*) piling would probably have to be resorted to in order to obtain a satisfactory bottom. It would be better to use cast-iron socketed drain pipes of the requisite diameter as the pipes run in greater lengths and the joints are consequently fewer. Joints should be carefully caulked and run with (metallic) lead. The piles should be driven in pairs, one pair under each joint, and connected transversely by runners. On and around these runners is a layer of concrete laid to fall, upon which rests the drain, which is eventually embedded in concrete (see illustration on next page). The sides of the trench would have to be strutted, and planked and strengthened, perhaps, with guide piles if the ground were very bad.

3. *What is meant by "cross ventilation?" Describe the general construction of an anemometer, and state how you would determine the velocity and volume of air passing through a vertical exhaust shaft fixed at the ceiling level of a room.*

Cross ventilation is, as its name implies, a method in which the air enters the apartment at one side or end and goes out at the opposite side or end; the object being to obtain as nearly as possible a horizontal current of air.

An anemometer is an instrument used for measuring the velocity and pressure of the wind —or air currents generally. The best known one is "Robinson's," which consists of a casing



DRAINS IN BAD SOILS

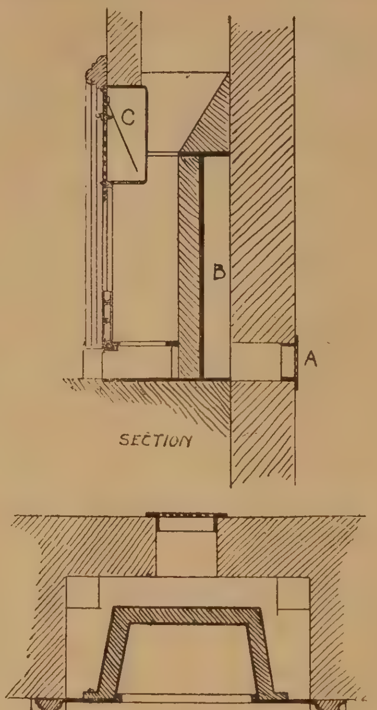
containing two horizontal bars crossing each other at right angles, each of the four extremities having hemispherical metal shells attached. This is arranged to revolve quite freely upon a pivot, the velocity of the current of air producing motion in the "wind-mill" being proportional to the rapidity of rotation. The velocity of the air should be determined by using an anemometer as described above, and the velocity thus obtained multiplied by the area of the air duct (or the number of units of velocity in contains), which will give the volume.

4. *Mention some of the chief points to be observed in arranging and fixing gas-pipes within a building. What sizes of service-pipes are necessary to efficiently serve four, ten, twenty-five and fifty gas burners respectively? Describe the method you would adopt for the purpose of testing the gas pipes and fittings at the completion of the work.*

The pipes leading from the meter to the points of consumption should be of wrought-iron with screwed joints, laid upon the surface so as to be easily accessible. Lead or composition piping should be avoided as it could be easily gnawed by rats, and if laid under plaster may inadvertently be pierced by picture nails. All cocks should be full-way, and all angles made with screwed elbow or tee pieces. Service pipes for four burners should be ⅜in. diameter; for ten burners, of ½in. diameter; for twenty-five burners, of ⅞in. diameter; for fifty burners, of 1¼in. diameter. In testing, all gas outlets should be capped tightly before the various fittings are attached, and the whole system of piping tested by connecting a water gauge 20in. long and by means of a gas-fitter's air pump raising the pressure to 18in. This pressure should be maintained for four hours without showing any decrease. Fittings should be tested separately.

5. *Give a short description and explanatory sketch of a ventilating stove, with fresh air inlet. What are the chief characteristics of a "high pressure" and "low pressure" hot water apparatus respectively? Which system is generally used for warming ordinary buildings, and why?*

Ventilating stoves are of many varieties, but in all of them the object is to bring fresh warmed air into the room. In the stove illustrated (Grundy's) the fresh air is brought in at the back at the point marked A, and passes thence into the warm-air chamber B, which extends, as shown on plan, round the sides of the firegrate. From here the air passes out into the room through a register C fitted with regulating adjustment (see illustration). In "high-pressure" hot-water heating the boilers used consist of coiled tubes capable of sustaining pressures up to 500lb. per square inch. The circulating tubing is of wrought-iron of small diameter, carrying water which is heated to a temperature of from 200deg. to 500deg. Fahr. The boiler must be placed below the level of the lowest room to be warmed. The "low-pressure" system is cheaper and requires much less care in its manipulation; the pipes used are larger in diameter, and almost any form of boiler may be employed. The temperature rarely exceeds 200deg. Fahr., and the air is more equally warmed throughout the apartment, and the heat more easily regulated. There is very little danger from fire.



SECTION

PLAN

WARM AIR STOVE

The low-pressure hot-water system is that which is most usually adopted in ordinary buildings; some of the reasons have been given above but may be recapitulated. The first cost is as low as that of any other system, while in the subsequent cost of maintenance it is by far the cheapest. The temperature diffused is equable and not of an objectionable "parched" nature; easily controlled and regulated; above all, there is less risk from fire than in any other method.

6. *Describe in detail the procedure you would adopt, and the several tests you would employ in conducting an exhaustive examination of the existing water supply, drainage, and sanitary appliances of a small country house. Mention the various details of construction and general arrangement which you would particularly notice.* (*This question was voluntary.*)

The first thing advisable to do with regard to the water would be to have samples analysed by a competent analytical chemist, while at the same time the source of supply should be inspected in order to judge whether it is in such a position or of such a nature as to render the possibility of temporary pollution sufficiently urgent to require guarding against. There are three principal sources from which domestic water supplies may be obtained: from a gathering ground and reservoir, from pure water lakes or rivers, and from springs or wells—not shallow wells. From whichever of these the supply is derived, careful investigation must be made in order to see that nothing deleterious exists sufficiently near to the source to menace its wholesomeness. Filters, of whatever form, should be thoroughly tested for efficiency. For supplying the water to points in the house lead piping is considered the best, jointed with wiped joints; the cistern should be of lead or other approved material, with a close-fitting cover, and placed where it can be easily got at for periodical cleaning. Supply pipes should be taken off the rising main, and w.c.'s served from small cisterns isolated from the main supply. For testing the drainage of a house, the underground works should be tested with the standing water test, and the condition of all manholes, &c., carefully examined. If the system is found to empty into a cesspool the position of this and its construction, facility of emptying, &c., should all be carefully taken into consideration. If the house is old, the water closets should be submitted to the most careful scrutiny. Possibly "D-traps" may be found fitted to them, and they, of course, must be removed and others substituted. Sufficient water for flushing purposes must be supplied to each closet, which may be tested by means of plumber's soil and two or three pieces of paper thrown into the basin. This should be all cleared out with each flush. Bath and lavatory wastes should be of a sufficiently large bore to carry off the water at a fair rate. No waste pipe should be smaller in diameter than the grating above it. The wastes should have efficient water seals, and from the crown of each out-go should be taken an anti-syphonage pipe (this applies equally to the traps of soil pipes). It would be well to ascertain also whether the house is proof against damp, either from the ground below or from leakages in the roof, the latter being the most probable source of damp. All missing and broken slates should be made good, the gutters and down pipes, &c., overhauled and generally made perfect. Windows and doors should be examined with regard to their hanging and fitting, and should always be treated as a possible entry for draughts. Floors, skirtings, and similar parts should be thoroughly inspected for vermin, or to see whether they are likely to form a harbourage for these pests.

MR. CHAMBERLAIN ON ART.

MR. JOSEPH CHAMBERLAIN distributed the prizes at the Birmingham Town Hall last Friday, to the students of the Municipal School of Art. He said that after perusing the addresses of some of the eminent practitioners of art who had previously occupied his position, he gathered that art, or those who pursued it in any shape or form, constituted a priesthood removed far above and beyond the aspirations of ordinary men. Their industry must be indefatigable, their patience must be inexhaustible, and their reward must be found in the success of conscious virtue. But was there not something a little excessive in those idealisations? He had read something of the lives of the great masters of art in classical and mediæval times, and he had found that those men were exceedingly human in their defects as well as in their virtues, and full of personal ambition, anxious for the respect and the praise of their fellow men, and not indifferent to the material delights which the successful and honourable pursuit of a great profession brought with it. Under these circumstances he was not disposed to advise them at the outset of their career to practise this excessive altruism. On the contrary, it seemed to him that the labourer, whether in art or in anything else, was worthy of his hire, and that he might fairly look forward to a reasonable reward for his exertions and his merits. While he thought they should not despise these motives—to exercise which had frequently opened the springs to high endeavour—yet their success would be the more assured if their aims were moderate, and if their ambition was not of the kind which o'erleapt itself. It was not the object of such a school as theirs to manufacture genius, and if it was its object it would certainly fail, for it was not in the power of any school to turn out, say, Titians or Rembrandts by the dozen or the score. These great men, these geniuses who occurred now and again in a generation, he fancied would do in the future as they had done in the past without these extraneous aids to success. Genius could not be repressed. It was not the geniuses, but the vast majority, whom a school such as theirs desired to help. Any attempt to manufacture genius would only result in the multiplication of mediocrities, for which there was already insufficient room in the world.

They had to help the majority of ordinary workers in trades or crafts that lent themselves to art to do their ordinary work better, and to show how objects in common use could have a grace and harmony of their own, a fitness and appropriateness which they would never have if they were always produced by the uninstructed eye and the uninstructed hand. Therefore, if he were to venture to describe the function of such a school as theirs in a sentence, he should say that it was to educate first-rate craftsmen, and not to multiply tenth-rate artists. After all, it was a much nobler task to strive successfully to add grace and beauty to the accessories of their ordinary human life than to fail ignominiously in producing masterpieces, which only the rarest talents could hope to accomplish.

If their object was the improvement of common things rather than the production of masterpieces, he was led to make one inquiry to which he had never seen a complete answer. Why were our common things, the things with which we lived, with which we passed our lives, which were of infinitely greater importance to our education than even the masterpieces which we saw occasionally for a few hours or minutes in our great picture galleries —why were these things, which were part of our everyday life, so inferior and so inartistic? If they looked back a little—say 100 years or so—they found that all those ordinary belongings, the furniture, the embroideries, the carvings, the metal work, the pottery, however humble they might be, however modest in their pretensions, were nevertheless now sought by collectors at prices altogether beyond their intrinsic value, sought as works of art. He did not think the product, he would not say of to-day, but the product of thirty years ago, was likely to be sought after with a similar object by the collector. There seemed to have been a gradual and almost continuous deterioration from the time of Queen Anne, and going back further still they found this falling off until it reached its acme in the early days of the reign of Queen Victoria in a condition of hideous ugliness and vulgarity which had never been paralleled in the history of the world. But what was the cause? That in the interval of which he had spoken the condition of the people had wonderfully improved. They were more prosperous, more refined, better educated, and yet all their belongings showed infinitely less of interest, of harmony of design, of beauty of colour and of correctness of proportion. He thought the reason was to be found in the further increase of prosperity of which he had spoken, and especially in the great, the vast, and even the disproportionate improvement in the condition of the masses of the people. People, poor people, who, up to that time, had never considered the possibility of doing anything but provide themselves with the merest and the barest necessaries, began to find that it was within their means to add many comforts of which they had hitherto been ignorant, and they desired naturally to secure for themselves in some form or another the advantages which hitherto had been the privilege of the rich. As their wants multiplied, although their condition had improved, their means were not sufficient to supply those wants except in the cheapest form. They could not afford the price for originality of design, and hence it came about that in the early period of Queen Victoria's reign the whole energy and ingenuity of manufacturers were directed to producing by machinery, in enormous quantities and at the lowest price, imitations of the articles which had previously been used by the rich alone. The effect of that was that instead of a production which was single and separate, and in which every article bore the impress of its designer's mind and character, the machines made reproductions which could not possibly be expected to be equally artistic.

Another result which followed with equal certainty was that the British workmen lost his original gift. He was no longer called upon to exercise it; the demand had ceased for these single articles, and he was only part of the vast machine which was engaged in turning cut endlessly and ceaselessly articles for the million. If that was a correct explanation of the extraordinary degradation of art in the period when the first beginning of this great prosperity dawned upon us, it must lead us to moderate our aspirations for the future. If it be true, as the late William Morris once said, that art had failed as civilization had advanced, we could not afford to give up civilization. However ugly might be these mechanical reproductions, we could not abandon the comfort, the health, the general happiness which had been brought about by the cheapening of articles in common use—the articles, in fact, upon which the domestic life of the masses of the people so largely depended. But he did not for a moment say that we ought to be satisfied with our present results. It seemed to him that while we must accept the conditions of our time, while we must recognise the necessity for seeking the assistance of machinery and of all the devices which would bring within the reach of the many, if not the highest works of art, at all events something elevating and something which might be accepted as a provisional substitute for them, still he thought such schools as that with which they were concerned might do and had already done a great deal to improve both the general taste and the general quality of the work which was turned out. There would always be, he hoped, liberal-minded communities and wealthy people to whom cost would not be the first object, and who would desire to possess themselves, and to endow the country with, stately buildings, with objects of art, with priceless pictures, with beautiful statues; and it was one of the objects of such a school as that to enable them to gratify their wishes and aspirations, finding craftsmen who were worthy to carry out such desires. At the same time the school must also endeavour to cater for the many, and in spite of the limitations of manufacture it was his conviction—and he believed experience showed this—that a great deal might be done to give simplicity of design, to give a certain grace of form and general appropriateness which would very materially improve those reproductions to which he had referred, perhaps, in terms of depreciation.

Since the development of art education, which began about the period of the Great Exhibition in 1851, there had been a great advance, upon which we had a right to congratulate ourselves as to the past, and to express sanguine hopes as to the future. He commended the Birmingham School of Art for what it had done to accomplish the union of the craftsman with the designer. To enable the man who was carrying out the work to have some say in the character and shape, to enable the designer to go to his design with a knowledge of the limitations of manufacture, that indeed was to reproduce to a great extent the conditions under which art reached so high a character in previous centuries. There had also been a quickening of interest in the work of the school, and something had been done in a direction which perhaps was more important than all towards educating the public to a higher appreciation of an artistic sense, which, he was afraid, it would be flattery to say that they possessed before. Then, again, the municipal spirit had begun to work, and he believed the time was coming when the people of Birmingham would refuse to tolerate bad architecture in their midst or sordid buildings.

It was said by a great artist that the only people in civilization who were really happy were those whose necessary daily toil was inseparable from their pleasure. Mr. Chamberlain was not certain that, judged by that standard, there was very much of pleasure in the ordinary daily toil of the ordinary artisan. In our present system the ordinary artisan had to perform the same monotonous operation thousands or hundreds of thousands of times, day after day, year after year, during the greater portion of his life; and the infinite multiplication of ugly things could not, he feared, be considered as a very elevating pursuit. But if they could even in the slightest degree introduce into that man's life the element of art, there came in with it all the freshness of originality, the pleasure of imagination, and the individual interest which would add so much life to the humblest work.

Professor Huxley's Statue is now finished, and will be removed from Mr. Onslow Ford's studio to the Natural History Museum at South Kensington, where it will remain.

Under Discussion.

BUILDINGS IN THE HOLY LAND.

In the course of the lecture on "Ancient and Modern Buildings in Palestine," delivered before the Leeds and Yorkshire Architectural Society on December 4th, Mr. Beresford Pite said that the architectural interest of Palestine began with caves, followed by rock tombs, cisterns, oil and wine presses, and sculptured and carved sarcophagi. The architectural influences began with the Egyptian, after which Phœnician and Assyrian influence could be traced. Then followed a Greco-Roman period, then a period more exclusively Roman; and, passing to the Dark Ages, the Arab period was reached—the Arab busying himself with dismantling the Roman buildings and using the materials in his own erections, very often in an absurd way. Following the Arab time came the Crusading period, which covered Palestine with the most interesting examples of mediæval art, similar to what could be found in France and England, and even Germany. Then there followed the long period of Turkish darkness, which was succeeded by the modern era, out of which was growing a definite modern style in the European buildings; and, sad to relate, our own local Gothic revival had some rather *outré* examples in the Holy Land. The building material of Palestine was a hard limestone of coarse grain, and consequently there had not been carried out in that country any ornament worth the name. There was nothing in the whole country to correspond with the marbles of the Greeks, or the granites at the disposal of the Egyptians. Dealing with local regulations and authorities, Mr. Pite explained that when foreigners desired to erect buildings of any size in Jerusalem, an Imperial firman had to be obtained from Constantinople. A fuller report of this same lecture appeared on page 394 of the Builders' Journal dated January 25th last.

NOTES ON ART.

Some "Notes on Art" were given by Mr. W. M. Page at a meeting of the Edinburgh Architectural Society held on December 6th. Mr. Page said that art, like man, had a life and consequently a history. Art in architecture originated in Egypt, and through Greece and the Renaissance was brought down to the present day. In earlier days architects had more freedom: they were not hampered by a public the bulk of whom possessed no artistic taste, for, nowadays, beauty in architecture was considered, by the many, to be unnecessary —the main thing was pecuniary gain. By the modern system of education in our schools, *Art* was not taught, but only a little technical skill. Art might be defined as the interpretation of nature, or, as applied more particularly to architecture, as fitness, truth, simplicity or refinement. Elaboration in a building should not be confined to one part, such as one elevation only or on the outside only, but should be applied equally to produce a harmonious whole. Architects in modern times were often employed not to design a building but merely to carry out the desires and whims of a client. Imitation was a characteristic of present-day architecture, everything being made to represent something better than it really was. Art in buildings had a greater influence upon the public than in pictures or other forms of art, owing to the prominence of these buildings in streets, &c., where they greeted the eye of every passer-by. The history of art was, however, not yet finished, and it was satisfactory that the architectural profession contained a large number of thoroughly artistic men. Some discussion took place upon a few of the points raised by Mr. Page in his lecture.

THE SMALLEST CHURCH IN CORNWALL.

The Church of Tremayne in Cornwall was the subject of a recent lecture by Mr. Edmund Sedding at the Plymouth Institution. What made it remarkable, lacking as it did detail and delicacy of workmanship, was the character which these old builders displayed in going into a little out-of-the-way place where there were only a dozen cottages. The colour of the stones used in its construction and the thickness of the walls indicated that the church was built probably in Norman times. It was the only church he knew in Cornwall without any sign of an aisle or transept. The upper part of the tower was of fifteenth century date, the lower part being at least two centuries earlier, but it was badly built. It was only 45ft. high. The pinnacles were falling outwards, but they could be brought upright, the lecturer observing that they were beginning to learn how to restore ancient monuments in this country. It was the beauty of proportion which was so thoroughly understood by old builders that made these ancient churches so charming to the eye. The eaves of Tremayne Church could be touched from the ground. Perhaps the most interesting feature was the little Norman doorway, the smallest he had ever seen or heard of, it being only 18in. wide. At present it was blocked, but it was proposed to open it up. Looking at the church from inside, which was only 15ft. wide and about 40ft. long, they saw that the pulpit could only be occupied by a short preacher; a tall one would knock his head against the roof. The old roof remained unrestored, the curved ribs having been hidden by plaster at the beginning of this century, and it was a debatable point whether the plaster would not now be removed. The font was early Norman, although most probably fashioned by Saxon workmen from Norman designs. The idea had grown among the villagers of Tremayne that the old church would have to be pulled down. He was applied to by the vicar in despair, and he suggested taking away half the wall and fixing a new piece to the remaining portion. This would not disturb the outside face at all, and the inside would be plastered up like the old. He also suggested the addition of a flying buttress in the treatment of a bulging wall. Not only did the old churches show the force of character and the love of the old builders in their work, but their age gave to them a natural beauty which it was impossible to imitate. It was incumbent upon everyone, therefore, to raise his voice against the old churches being spoilt, and some strong effort ought to be made to rescue or, at any rate, maintain the works of tradition.

THE ADVANTAGES OF AN IRISH CHANNEL TUNNEL.

The promoters of this scheme do not say it is possible, but they maintain it is the duty of the State to determine once for all whether the scheme is possible, because if it is then it ought to be carried out. They wish to obtain scientific certainty on the subject. Mr. Pirie, M.P., said recently at Aberdeen that in the past most of the great schemes which had contributed to the progress of this country, and the world at large, had been treated with ridicule when the proposal was first brought forward. The proposal to construct a railway between Portsmouth and London was opposed tooth and nail by the Duke of Wellington. The construction of the Suez Canal was utterly opposed by Lord Palmerston. Schemes for the construction of subaqueous tunnels were very far from being new; the best known was the scheme for constructing a tunnel between France and England under the Straits of Dover, and he mentioned that it was only decided by a majority of one in a Committee of the House of Lords that it should not be proceeded with. The least difficulties and obstacles in the way of that tunnel were those connected with engineering. It had been stopped entirely for political reasons, reasons which in the case of a tunnel between Great Britain and Ireland did not exist. In connection with the various proposals for an Irish tunnel, he referred to the efforts of Sir Edward Watkin and several eminent engineers. Mr. Barton, the well-known engineer, was now, he stated, a member of the Irish Channel Committee, and the line he proposed as the most feasible was the one which the Committee had adopted. This line would leave the existing railway at Stranraer, on the west coast of Wigtownshire, and pass north about six miles, afterwards descending by a gradient of 1 in 72 to the tunnel, which struck the Irish coast on the promontory of Island Magee and joined the service of the Belfast and Northern Counties Railway. The train would have to proceed on a third line of rails owing to the fact that Irish railways had a broader guage than those constructed in Great Britain. The length of the tunnel beneath the sea would be twenty-five miles; but there would be five miles below land at each end, so that the total length of the tunnel would be about thirty-five miles, whilst the total distance between Stranraer and Belfast would be about fifty-three miles. All experience went to prove that in tunnelling under the sea there was less water found than in tunnelling under land.

The advantages which would accrue from the construction of such a tunnel were, first, the political, in which he included the military and defensive; second, the commercial; and third, the international. He thought a matter like this would be entirely outside party questions, and with regard to the military aspect of the question, he stated that they had Lord Wolseley just as strongly in favour of this tunnel as he had been opposed to the Dover tunnel. As to the commercial advantages, the actual trade between Ireland and Great Britain was very large, the Scotch coal trade and other industries being especially large, and these would be increased to an enormous extent. From London to Belfast at present the quickest journey was done in twelve and a half hours; if the tunnel were constructed it could be done in about nine and a quarter hours, diminishing the time by one quarter. From Manchester to Belfast occupied eleven hours; with the tunnel it could be done in six. From Glasgow to Belfast, Londonderry, and Dublin, at present occupied six and a half, ten, and ten hours respectively; if the tunnel were constructed it could be performed in three and a quarter, five, and six and a half hours respectively. The journeys would be practically half what they were at present. From Aberdeen there would be a reduction of at least four to six hours to all the principal Irish towns.

The scheme might not pay immediately any direct profit, but the indirect gain politically, commercially and internationally would pay the construction of such a tunnel a thousand times over.

NOTTINGHAM MASTER HOUSE PAINTERS.

The third annual dinner of the Nottingham branch of the National Association of House Painters of England and Wales was held at the Albert Hotel, Nottingham, last Thursday evening. Mr. J. F. Marshall presided, and the large gathering included — Mr. T. Preston (Burnley), Mr. J. Ratcliffe (Bolton), Mr. Howitt, Mr. W. Robinson, Mr. Jarvis, Mr. W. Bee, Mr. W. Windle, Mr. Simms, Mr. F. Carpenter, Mr. Morriss (Liverpool), Mr. Loune (Hull), Mr. Greenwood (Mansfield), Mr. T. Munks (secretary), Mr. A. E. Shipley. Mr. W. Windle in proposing "The National Association of Master House Painters," said the National Association was prospering and increasing in numbers. Mr. T. Preston, of Burnley, president of the Association, in reply said, following the example of others who had found benefit in associations, they formed their society, and its existence had been fully warranted by what it had already done. They had proved to the public at large that theirs was no mean calling, but was a craft as important as any of those in existence. Since the association had been formed they had a truer and higher conception of the craft; at one time they began to think they were poor painters, and the least and lowest in the building trades, but now they were a respected body of men. They were also promoting the well-being of the workmen, and they had gone in for the education of their boys, inciting them to get on in the higher branches of the trade, and they had technical classes throughout the country. Mr. J. Ratcliffe, vice-president of the Association, proposed the toast of the evening, "The Nottingham Masters' Association," and in doing so referred to the question of competition. He said they were not brothers at all, as he tried to show in a paper he read at Hereford. Who made the competition? It was their own fault they had not a combine; they wanted a little of the spirit of the men that worked for them. When they took a job they wanted to make something out of it for themselves after allowing ample for labour and material. They must adopt the motto "Brothers all," and allow a little wider margin in their estimates. Mr. R. Jarvis responded; he said since the Nottingham Association had been formed it had done all it could for the uplifting of the trade. There was no association in the country that clung more together than theirs. He referred in a complimentary manner to the indefatigable energy of Mr. Munks, by whom many members had been brought in who hitherto had not seen the advantages to be obtained by joining the association.

Correspondence.

SOME SCANDALS OF LONDON STREET MANAGEMENT.

To the Editor of THE BUILDERS' JOURNAL.

WIMBORNE.

SIR,—"Flooding the roads, causing rivers of mud," that your correspondent complains about on page 258 in your issue for November 29th is, I expect, the only way the authorities, at present, have found out for getting rid of the mud by running it down the sewer. Some years ago I noticed little boys in red jackets with scoops and brushes, scrambling about the roads of London. I thought, can nothing be done to save these lads from broken limbs? To my mind it is comparatively easy for one to make a machine to brush and lick up the dirt and soil. I wrote a letter to the London County Council giving an outline of a machine for that purpose, which was "duly acknowledged." Since then I have had hopes of seeing the machine at work and the streets clean, but, alas, the streets are dirtier than ever. Even when there is no mud, the smell of horse ammonia is dreadful to those whose olfactory organs are perfect.—Yours truly,

W. T. CHINCHEN.

ELLIPSE BY COMPASSES.

To the Editor of THE BUILDERS' JOURNAL.

NEW CROSS, S.E.

SIR,—On looking through my copy of last week's BUILDERS' JOURNAL, I was greatly attracted by the article entitled "Ellipse by Compass." This article is supposed to be the execution of an impossibility, and I much prefer the statement of the Science and Art Department, "that the ellipse cannot be struck with the compass," to that which Mr. Ramm states at the head of his article. He says "that it is not intended here to go into the analytical demonstration of the figure worked by his method," with, I suppose, the object of proving it to be a true ellipse. As I am greatly interested in the striking of this curve, I should feel greatly indebted to him if he can analytically demonstrate it to be a *true* ellipse. The method described gives a very fair approximation of that which it is intended to be, but I think that anyone who draws the curves to a large size—that is, one by the use of the trammel and the other by this "new" method—will easily see that with given axes the curves do not agree. Approximate ellipses have been drawn by the use of compasses for many hundred years, and are better and more truly known under the name of three, four, five, six, seven or more centred curves. During my experience, I have repeatedly had to point out that no approximation gives such a beautiful line as the true ellipse. I have also had to contradict the statement which Mr. Ramm wishes to prove true, that "the ellipse can be constructed with the compass."—Yours truly,

RUFUS E. MARSDEN.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

SOCIETIES' ADDRESSES.

CARMARTHEN. — STUDENT writes: — "Will you please let me know the addresses of the secretaries of the following: (1) The Incorporated Association of Municipal and County Engineers; (2) The Sanitary Institute; (3) The Institute of Sanitary Engineers."

(1) 11, Victoria Street, S.W.; (2) 72 and 74A, Margaret Street, Regent Street, W.; (3) 63 and 64, Chancery Lane, W.C.

STUDY TO FIT ONE FOR CLERK OF WORKS.

COMBE MARTIN.—W. C. writes:—"Being a general stonemason, aged forty-three, and having a wish to improve myself to fit myself for a building inspector or a clerk of works (have held foremanship), will you please give me particulars of subjects best suited to take up by correspondence class, as I have no chance to attend a technical class, owing to none being held near me. Will you please give best subjects and my best course to adopt; also books (not too costly), and state if examinations are held for clerks of works, &c."

The best subjects to take up would be Building Construction and Constructional Drawing, Drainage, Quantities and Pricing, and Book-keeping; and a good and inexpensive collection of books would be Mitchell's "Advanced Building Construction" (Batsford), Mitchell's "Forty Plates of Building Construction" (Cassell), "Specification, No. IV." (published at these offices), Middleton's "House Drainage" (Batsford), Leaning's "Quantities" (Spon), Stephenson's "Estimating" (Batsford), Hunter's "Self-Instruction in Book-keeping" (Longman's), and Leaning's "Duties of a Clerk of Works" (Batsford). Unfortunately W. C. has passed the age limit of the only examination held for clerks of works, and must rely for appointments upon introductions and personal fitness.

G. A. T. M.

COST OF ACETYLENE GAS.

HEREFORD. — LIGHT writes:—"Could you kindly give any information as to the cost of acetylene gas installation in a country house, and also as to the better kinds of generators, there being so many of poor (and dangerous) quality on the market."

The cost of an acetylene gas installation at a country house would, of course, vary with the number of lights required, but the cost of an automatic acetylene gas generator may be taken at about £1 per light, exclusive of fixing, fitting up, carriage, &c. The cost of piping a house for acetylene gas cannot be taken at much less than £1 per point, as this part of the work must be done in the best wrought-iron pipes fitted together with screw joints of a special kind, and left absolutely sound at a pressure of 10in. column of water. The fittings for acetylene gas must also be of the very best kind. Birmingham fittings will not stand at all. The quality of the metal and the finish has to be exceptionally good or they prove a constant trouble. The fittings, pendants and brackets may be taken at costing 10 per cent. to 15 per cent. more than ordinary fittings of the best quality. Messrs. Strode and Co., of 67, St. Paul's Churchyard, E.C., make a machine which is different from most others in construction, in having the carbide dropped into the water instead of letting the water run on to the carbide. By this system no heat is generated, and the gas consequently does not deposit and block up the pipes and burners.

ANCIENT LIGHTS.

SHEERNESS-ON-SEA.—T. W. P. writes:—"On page 65 (par. 9) of the last issue of "Specification" the right of light is quoted as twenty years. Has this by any act been altered to twelve years? I cannot quote authority, but am informed that in a case recently tried, right was decided on twelve years for dominant owner. Also, I wish to remove light marked 4 on the accompanying sketch (not reproduced) 4ft. nearer No. 3. Dominant owner wants £100 for the accommodation (it is only a bakehouse). Are the new lights *ancient*, seeing that when the old workshop was removed, ten years ago, and the bakehouse built, he raised the lights in height from 1ft. to 2ft?"

There is no alteration in the statutory period of twenty years required for the acquisition of a right to light. The statutory period of limitation for actions brought for the recovery of possession of land has been reduced from twenty years to twelve, which is probably what T. W. P. has in his mind. The new lights are "ancient" only to whatever extent, if any, they coincide with the old lights—assuming that these old lights were themselves "ancient," in the sense of having been in existence for the statutory period. Any part of a new window which exactly occupies the same position as was occupied by an old window enjoys all the rights of the corresponding part of the old window, but if no part of the new window occupies any part of the space formerly covered by the old one, the new window is wholly a new light.

A. H.

REQUIREMENTS OF PERSPECTIVE ARTISTS.

BRIXTON, S.W.—H. MCR. writes:—"What is the minimum amount of technical knowledge necessary to make an efficient perspective artist, and which is the quickest way of obtaining this?"

It may at once be stated that the minimum in this case is a great deal. The perspective artist must be thoroughly conversant with construction, and, as a proof of this, let him master the rules of perspective (short articles have appeared recently in the BUILDERS' JOURNAL on the subject), which are comparatively simple, and attempt to set up a drawing of some building from the working drawings; and I venture to think he will find himself thoroughly at sea. The best course for H. McR. to pursue will be to go for, say, a year into an architect's office, which, should he possess a knowledge of tracing or drawing, he will be able to do at a small salary. He will in this way become acquainted with working drawings, which is essential. Whilst here, he should study thoroughly the first two volumes of Rivington's "Building Construction," at the same time practising "setting up" perspectives. Then as regards the actual finish of the work. Does H. McR. aim at watercolour or line? Knowledge and proficiency in the former are only gained by constant study from Nature, special attention being given to trees and skies; whilst in the latter, which is somewhat easier, drawing objects direct from Nature with the pen is highly advantageous. A knowledge of the figure is also desirable, as these in a picture give scale and life to it. Should H. McR. be unable to give a year in an architect's office, he would learn much to assist him at the Polytechnic building construction classes. Full information of these may be obtained from the Secretary, Regent Street Polytechnic, W.

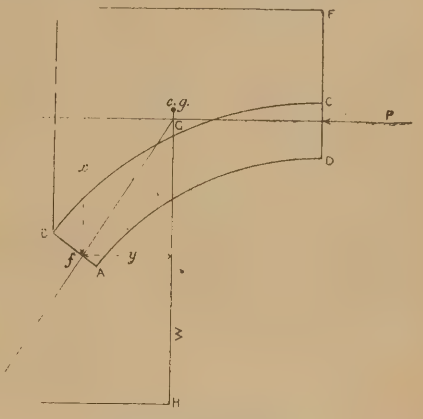
H. F. W.

THRUST OF ARCH.

LOUGHTON.—S. H. J. M. writes:—"Can you tell me how to obtain the overturning thrust of an arch?"

Referring to the accompanying illustration, let A B C D represent half elevation of arch, and B E F C the superstructure and external load in its equivalent of masonry all for one foot run through the arch. Let c.g. be the centre of gravity of the whole mass, including the arch itself; W the load acting through the centre of gravity; P the point of application of the horizontal thrust at crown of arch at outer limit of middle third. Take a point *f* on the skewback A B at inner limit of middle third giving the distances x y from force lines P and W; this point will be the fulcrum and in the probable line of thrust. Then $P\,x = W\,y$, $\therefore \frac{Wy}{x} = P$, which is the amount of overturning thrust acting horizontally through *f*. To find this graphically produce line P to cut line W in G, make G H = whole load W, draw G *f* and produce to I, making H I horizontal; complete the parallelogram by drawing I J, G J, then the thrust G I is the resultant of the thrust G J (P) and load G H (W). The amount of thrust G I in tons divided by the length of skewback A B in feet will give the tons per foot super average pressure, and twice this will give the maximum, which will occur at the springing point.

HENRY ADAMS.



THRUST OF ARCH.

The Roman Catholic Cathedral, Westminster.—This large building is now approaching outward completion. Though the scaffolding still around it prevents one from easily calculating its general effect, it at present certainly gives us the idea (says a contemporary) that it will not be an addition to the architectural beauties of London. Built of red Roman bricks, faced with stone, it looks as gloomy as a cathedral could possibly look. It has no pretence to the grace of Westminster, or the majesty of St. Paul's. It is gigantic, but unlovely.

New Market Hall for Stockton.—The new Market Hall and Corn Exchange, which the Stockton Corporation have decided to erect on the site of the old Shambles in the centre of High Street, will cost £4,446. The ground floor of the new hall will be 114ft. 3in. long by 45ft. wide, being the same width as the present Shambles and 6ft. 3in. longer. There will be space for eighty-five stalls, as against seventy-five at present. By the use of hinged flaps the accommodation can be further increased. On the upper floor will be the Corn Exchange, 102ft. 6in. long by 32ft. wide in the clear, and 43ft. 6in. wide if measured into the recesses between the posts. The whole of the floor space can thus be utilised.

Progress at Newport, Mon.—A Bill which the Corporation propose to put before Parliament next session includes powers for the transporter bridge, electric traction for the tramways, the erection of a lunatic asylum, the taking over of the functions and powers of the Commissioners of Sewers within the borough area, with several etceteras. The owners of the Protheroe estate propose building a suburb at Malpas on the confines of the borough, and negotiations are in progress with reference to a main sewer for the district. The Maindee and adjoining estates are also to be developed for building purposes, and a new main sewer will have to be provided for that district also. An engineer has been appointed to prepare plans and specifications for the raising of the eastern bank of the Usk, so as to prevent a recurrence of the floods which have caused much damage in previous years.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*The workman of to-day is not the artist as his forefather was, . . . it is the hope of my life that this may one day be changed; that popular art may grow again in our midst; that we may have an architectural style, the growth of its own times, but connected with history.*"—WILLIAM MORRIS.

Our Inset Plates. THE old houses at Aldgate, shown on the left-hand side of one of our inset plates, stand fronting, and, so far as one may judge by appearances, are possibly coeval with, the more celebrated Aldgate pump. They have no historical associations, but are, nevertheless, interesting as uncommonly quaint and picturesque relics of that older London which is fast vanishing. The old houses and shops on the right hand are nearly opposite the Aldgate railway station, and are quainter and of even greater antiquity than the others. Nearly all the shops are and have long been occupied by butchers, and the whole row is commonly known to Londoners as "The Shambles." With regard to the other illustrations on the same sheet, West Walton Church is situated about three miles from Wesbeck, and is chiefly of the Early English period. The piers have detached shafts, and are ornamented with the dog-tooth ornament. The church is noted for its fine carving, the beautiful capitals of stiff leaf foliage being equal to the best work of the period. The font is of later date, being in the Decorated style. The building generally is sadly in need of careful restoration; many of the capitals are cracked and broken, and the marble shafts and mouldings are in a dilapidated condition. The church of St. Wendredra, March, is noted for its very fine open timber roof, which is one of the richest in the eastern counties. It is a double hammer beam roof of the perpendicular period, similar to the one at Knapton Church, but lacking colour decoration. On the ends of the hammer beams are carved figures of angels with outspread wings, and on the corbels a series of canopied figures. The beams are richly moulded, and ornamented with rows of the Tudor flower; the wall plates and purlins have the same enrichment. The church was partly rebuilt in 1528, and was carefully restored in 1875. All the illustrations mentioned above are by Mr. Frederick Adcock, of Hampstead, N.W.

The Convocation House, Oxford. THE Convocation House, built in 1639, forms part of the Bodleian Library buildings and consists of a large hall under that portion of the library in which the books of Seldon are deposited. This hall, part of the woodwork of which we have illustrated in one of our inset plates this week, is used for carrying on the general business of the university, and also for conferring degrees upon those who have satisfied the examiners in the public examinations. The canopied chair shown in the illustration is that used by the vice-chancellor; alongside are arranged the seats of the proctors and doctors, while down the sides of the hall are the benches for the masters of arts. The woodwork throughout is of dark oak, the detail being of bold design and the perspective treatment in the wall panelling having a most pleasing and characteristic effect. Adjoining the hall is the "apodyterium," or unrobing room, in which is held the chancellor's court. The woodwork here, as in the hall, is particularly fine. It is a matter of regret, however, that considerable doubt appears to exist with regard to the designers of this beautiful piece of work. Our illustration is from a measured drawing by Mr. Alfred Greig.

Illicit Commissions. CASES of illicit commissions occur from time to time, and should be given every possible publicity, as this underhand practice is highly deleterious to the architectural profession and requires to be thoroughly stamped out. The most recent instance comes from Birmingham, where attention has been drawn to it by the Birmingham Architectural Association. It appears that a number of local architects have received a letter from a Wolverhampton manufacturing firm in which the following paragraph occurs:—"It is our intention to allow architects a handsome commission on all specifications of our productions." The letter was accompanied by a circular, on which a slip was attached marked: "Private—prices subject to 25 per cent. commission" (not discount). There have already been too many examples to need our pointing out what a mean and sneaking method this is of conducting business.

Fireproofing Floors. THE chief objects in fireproofing, said Mr. J. H. Blakesley, M.A., A.M.I.C.E., at a meeting of the Civil and Mechanical Engineers' Society last Thursday, should be to adapt the protection to the actual needs of the building so as not to increase cost unnecessarily, to avoid thrust on the side walls, and the depth or thickness of the floor, which increases the amount of brickwork in the building; and, lastly, the strength in proportion to the weight of the floor. In most cases the floor between the supporting joists is stronger than the joists themselves, and any great excess of such strength over that of the joists is therefore superfluous. With regard to materials, hydrated cements should be avoided when exposed to very fierce heat, though usually employed where covered by more refractory substances. The advantages of porosity are generally non-conduction of heat and lightness. The disadvantages are the liability to the generation of stresses in the pores when the heated substance is played upon by cold water, and consequent rupture. Maurer's and Wright's bricks are highly porous, and in some cases have shown good results. Coke breeze concrete is of variable fireproofing power according to quality, and some sorts make apparently better fuel than fireproofing material. There is a danger in the best non-conducting substances owing to the stress produced by suddenly cooling the surface, which is likely to cause rupture, and here a hydrated plaster may with advantage be used to protect the principal structure from sudden changes, although not contributing itself to the strength. Fireclay appears to be the best substance for resisting heat, and if properly worked is of considerable strength, as shown by tests made by the author. Nevertheless, those clays which are vitrifiable should be avoided though stronger than others. In the old brick arch system, the chief disadvantage was the exposure of the joists. This is remedied partly by covering those below, which is of unmixed advantage, and partly by separating the joists widely, which increases weight, depth, and thrust, and is therefore partly disadvantageous. Hollow arches decrease the weight, and flat arches the depth, but the latter increase the thrust, and tie rods to counteract this have great disadvantages. Hollow flat arches are of two sorts, the end-pressure system and the side-pressure. The former is the stronger, and has the merit of encasing tie rods, but has disadvantages of erection in practice; side pressure arches are not so strong, but are preferred generally on account of their hollows being parallel to the joists. A great requisite for economy is uniformity of section in the blocks, that they may be made by being squeezed through dies. In America the side and end-pressure systems have been combined. Flat floors are stronger than requisite when in solid slabs, and when hollow in double slabs are otherwise inconvenient. Thin slabs, strengthened with metal and supported on joists far apart and separately cased, have been largely used. Tubular lintel floors have many advantages, being light and strong and protecting inferior concrete laid over them. They are also far more soundproof than solid floors, a great desideratum. They also have some practical disadvantages. Small arched floors get rid of some of these disadvantages, while preserving the main merits of the transverse tubular floor.

£198 for a Church. THIS is the handsome sum which St. Michael's, Bassishaw, in Basinghall Street, realised last week when put up for sale by auction. The church, which was put up in twenty-five lots, is being demolished under the Union of Benefices Act. The bidding was brisk but low, and the total proceeds amounted to just over £198. Two lots, comprising the brick and stone work of the church and tower, were withdrawn. The whole of the lead covering the steeple, the flats, and gutters, fetched £180, while the weather-vane was purchased for £2 15s. Eight ornamental stained-glass windows realised £2 5s., and a large pile of hassocks and a stack of matting were sold for £1 9s. The church perpetuates the name of the ancient Basing family, to whom Henry III. gave the advowson in 1246. It was rebuilt in the seventeenth century, in consequence of the destruction in the Great Fire of London of the older edifice, which had also been rebuilt in the fifteenth century. It measured internally 70ft. in length and 50ft. in breadth, and included two side aisles, which were separated from the nave by Corinthian columns. The tower was at the west end of the church, and consisted of four storeys, and the angles of the parapet were of an ornamental character. Above was a lead-covered octagonal lantern in two stages, surmounted by a short spire, culminating in ball, finial, and vane. The total height was 140ft. An attempt was made in 1892 to remove the numerous bodies which had been interred beneath the church, but it was found that that could not be done without great danger of the whole building giving way, and the church was closed by an order in council on account of its insanitary condition. The only remedy then was to unite the parish to those of St. Lawrence, Jewry, and St. Mary Magdalene, Milk Street, and a commission which was appointed to consider this scheme reported in favour of the union in February, 1894, and it was subsequently approved by the Queen. The parish of St. Lawrence, Jewry, to which St. Michael's has been added, was occupied by the Jews up to the time of their expulsion from England by Edward I. Both the original edifice and that of St. Mary Magdalene, Milk Street, were consumed by the Great Fire. The existing edifice was built in 1671, from the designs of Sir Christopher Wren.

An Unprotected Treasure. STRATFORD-ON-AVON would do well to buy a modern fire-engine. While there is no cause to be alarmed about any immediate danger to the national possessions in the town, a few facts with reference to what happened a week or so ago will make it apparent that some more efficient precautions ought to be taken to prevent our losing those buildings which are so closely connected with the greatest genius that the world has ever seen. A short time ago Messrs. Flower and Sons' brewery at Stratford was destroyed by fire. The local brigade was helpless, and steamers from Leamington and Warwick had to be summoned by telegraph, while the pressure in the water mains was feeble, and therefore insufficient. No grate fires are lighted at the Birthplace or in the Museum and Theatre, and New Place, already once demolished, has little of Shakespeare's building left to boast of. It is particularly with regard to Anne Hathaway's cottage that some anxiety is felt. This, as everyone knows, is a half-timbered thatched cottage, but ordinary fires are still burned in it. In a house of this kind the flames would very soon get a good hold, and, unless some efficient means for extinguishing them were at hand, it is very probable that the world-renowned cottage would cease to attract its yearly hoards of sightseers. Rightly or wrongly, the place is associated once for all in the public mind with Anne Hathaway, and it would therefore be a good investment if the Stratford authorities purchased a steamer of their own.

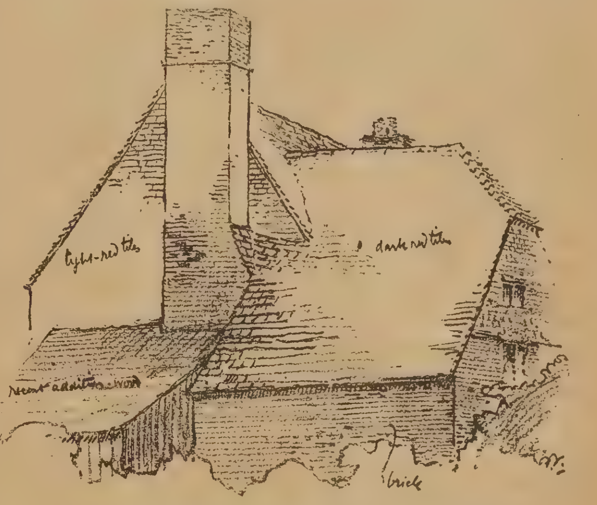
Albert Dürer. In the fourth of the series of fortnightly lectures on art subjects in the Glasgow Corporation Galleries, recently delivered at Glasgow, the Rev. John Macartney Wilson said that Dürer was no preacher, but an artist, and his aim was to reveal beauty to men—the beauty of line and colour, of light and shade, of the human form and face, of tree and flower and fair landscape, and even of the grotesque. But all that he did was the outcome of a beautiful soul, and was transfigured with spiritual light. It carried an unconscious message. In Dürer's day feudalism was passing away, but the artist loved to depict its finest produce, the "verray perfect gentil knight." Her old supremacy was being wrested from the Roman Catholic Church, and Dürer showed the wearers of tiara and mitre swallowed by the jaws of death; but he also loved to dwell on the figure of the simple and studious monk, and again and again with loving care depicted the figure of the Virgin, who was his ideal of a high and perfect womanhood. He was touched by the Renaissance, on which he passed the profound judgment of the "Melancolia," a pictorial embodiment of the Faust legend. Against this might be set the picture of the student of Divine things, St. Jerome, warm in the sunshine and happy over his books. He showed us the spirit of the Reformation in "The Knight," who scorns death and the devil and seems to sing Luther's hymn, "Ein Feste Burg"; also in his loving and reverent studies from the life and passion of Our Lord. In all these works he had taught the lesson of faith and hope and courage, not only to contemporaries, but to men of every age. The lecture, which was illustrated with a fine series of slides of Dürer's principal engravings, was listened to with marked attention by a large audience, and at the close, on the motion of the Lord Provost, a hearty vote of thanks was awarded to Mr. Wilson.

The Bloody Tower. The famous Bloody Tower in the Tower of London is being repaired. The upper portion of it, which faces Traitor's Gate, has been refaced in parts, pointed, and coloured to resemble age. The building is to be restored all round. Chalk, in large blocks, enters largely into the composition of the inner parts of the walls, and is declared by the masons to be as hard, if not harder, than ever it was. Some parts of the wall by the Tower are 14ft. thick. The greater part of the outer surface of the Bloody Tower, like that of the Bell Tower and some others, has, since the year 1832, been plastered over at various times with Roman cement, into which shallow portions of flint have been superficially embedded. This was in rough imitation of the old solid flint work of ancient times, which actually formed parts of walls, and is seen in perfection in St. Saviour's, Southwark; but as it was calculated to deceive, and become dangerous through its rottenness—the flints falling, and so on—it was all removed. The lower portion of the Tower, built of square blocks of Ashlar stone, has had a lot of superfluous Roman cement stripped from it, and looks somewhat incongruous in comparison with the upper part, which is of the irregular order of masonry; but that is unavoidable, and may in a measure yet be remedied.

Former Restorations. Restorations and repairs have often been carelessly done in much earlier years. For instance, the doorway that led from Raleigh's Walk directly to the room in the Bloody Tower in which the infant princes were supposed to have been murdered had been bricked up from the inside to give support to a portion of the Tower. This has all been removed, and the Tower strengthened in a more reverential way. The old oak door, with its heavy fastenings, which had been covered by the wall, now lies on its side on the wall, and when the rottenness at the bottom is repaired, is to be restored to its place. It was through this doorway that Dighton, Forrest, and Tyrell are said to have passed to their fearful work. Raleigh, Cranmer, and Ridley have certainly passed through it when prisoners here in the Tower, and Cranmer often, when he daily took his dinner with the lieutenant of the fortress. So say the authorities. Portions of the old houses which are to be seen above that part of the battlements known as Queen Elizabeth's Walk, which connects the Bell and Beauchamp Towers, are also undergoing restoration. It is said that Queen Elizabeth used this walk when she was a prisoner in the Bell Tower, hence its name. The old houses had sunk quite 15in., and had to be raised to their proper height by hydraulic means. Had they not been seen to in time, they would in all probability have tumbled down, and buried the esteemed lieutenant of the Tower, who lodges in them, in their ruins.

St. George's Church Tower, Liverpool. Sir Thomas Hughes, we should have thought, would have refrained from again bringing himself to the fore in championing the wrong side over the matter of the destruction or retention of St. George's Church Tower, that distinguishing mark of Liverpool. It will be remembered that this matter came before the Council some months ago, when it was thought that until the body of the church was demolished it would not be possible to form an adequate opinion as to whether it was worth while to retain the tower and spire as objects of architectural interest. For some months the site was in the possession of a contractor, acting under the Bishop of Liverpool's Committee, the Corporation being entitled under Act of Parliament to possession on July 15th last. The Finance Committee, having asked for the temporary retention of the tower and spire, showed a certain amount of indulgence to the contractor, but as he seemed to be making rather too long a use of the site as a place of sale for the material, the town clerk took possession on behalf of the committee, with the building in its present partially demolished condition. In moving the adoption of the Committee's report, Sir Thomas thought the body of the church had been sufficiently demolished to enable everybody to form an opinion as to whether it was desirable to leave the tower and spire standing, and the Finance Committee had come to the conclusion to recommend the total removal of the edifice. While there was, some months ago, considerable public opinion in favour of the retention of the tower and spire, now that the body of the church had been removed a very large number of those who originally supported the retention had altered their opinion. That was a change of opinion shared by some of the architects of the city. He knew there was still a remnant of those who believed it would be what they called "vandalism" to destroy this interesting structure, but he, for one, had been unable to discover its alleged architectural advantages to the port of Liverpool. While he might be charged with taking an utilitarian rather than a sentimental view, he reminded the Council that the site was valuable, while the surveyor, in an up-to-date estimate, stated that it would cost from £1,500 to £2,000 in order to make the tower presentable, besides which there would be continued expense of maintenance. The Finance Committee thought it would be wise to clear away the whole structure, and he might add that six months would be required to safely effect the clearance. It was entirely a matter of sentiment whether the Council would retain the structure or vote for its removal, as the Finance Committee, with only two dissentients, had recommended.

In Aid of Retention. Alderman Radcliffe sensibly pointed out that it was not fair for any member to judge of the tower in its present unfortunate state. He thought it would cost about £500 to pull down the tower and spire, but he could not think for a moment that so much as £2,000 would be required to face the eastern side of it, because they already had an abundant supply of suitable stone for the purpose. He moved as an amendment—"That the question of the demolition of St. George's tower and spire be postponed, and that the surveyor be directed to report to the Finance Committee the probable cost of pulling down the tower and spire, and also the probable cost of facing the eastern side of the tower, and prepare a design to show how the structure may best be adapted for a useful purpose." Sir William Forwood, in seconding the amendment, said the tower and spire ought to be retained as an attractive feature in the architecture of Liverpool. He looked affectionately upon the structure as associated with his boyhood and manhood, and as marking the site of the old castle of Liverpool. Mr. Willink said while he knew that one architect was in favour of the demolition of the tower and spire, he was not aware of any change of opinion on the part of the members of the Architectural Society and the Society of Arts, who favoured the retention. He had not changed his own mind, and while there was no official scheme for the utilisation of the structure, there were private schemes showing how the tower could be adapted for both useful and decorative purposes. He should feel very much the loss of this tower to Liverpool. In reply, Sir Thomas Hughes said the amendment only asked for information already before the Council. Anyone who wanted to get an honest opinion of what the tower, if left standing, would look like, could obtain it by the present view. It was no part of the instructions of the Finance Committee to produce plans for the future use of the site.—The amendment was rejected by fifty-eight votes to forty-three, and there is still hope that better counsels will prevail to have the tower retained.



COTTAGE BETWEEN TONBRIDGE AND HADLOW.
DRAWN BY FRANK LISHMAN.

Designing for the Country. In designing for the country one of the most difficult points to succeed in is to make the building fit the site—to make it "sit" well. And whether it be for the squire's mansion or the labourer's cottage, the village inn or the village church, no more suggestive or instructive district to help us in this particular can be found than the stretch of country lying more or less between Maidstone, in Kent, and East Grinstead, in Sussex. The roadside cottage with its oast-house, met with hereabouts, forms as essential a feature in the landscape as the orchard or the hopfield; they appear to have grown with everything around them, making it almost impossible to separate the one from the other in the mind's eye. There is, doubtless, a charm and fascination in the natural colouring of the materials employed: the browns, reds, purples, and yellows of the bricks and tiles; the silver grey of the oak framing, weather boarding, and shingling; with the plaster — either rough or smooth — which seems to contain, in the most delicate hues, all the tints to be observed in the more permanent materials. The smallness of the bricks with the wide mortar joints used in setting them also assist the scale and add to the texture of, and interest in, the wall surfaces; this being emphasised by contrast with the comparatively wide-coursed and smooth appearance of the vertical tiling where it is employed. Notwithstanding the great loss of charm of colour and material in the pencil sketches by Mr. Frank Lishman, A.R.I.B.A., illustrated on the previous page and in one of our centre plates, they serve to show where the success lies in these representative buildings—this will usually be found in the lines of the roof and in the position of the chimney or chimneys. If, in the designing of our present-day houses, the position of the chimney were only more considered we should have more pleasure in viewing the houses, and probably enjoy a greater amount of comfort in occupying them. To design the roof is to design the house, for the roof cannot be considered without the chimneys, nor the chimneys without the fireplaces, and a house cannot be called a home unless the fireside be inviting and free from draughts and other inconveniences of bad planning and construction. Under ordinary circumstances, given a well-designed roof, the success of the whole is practically ensured. The exigencies of the site and its surroundings should therefore be well considered—shown by the appreciation of a fine tree, or a group of trees, for instance—and advantage taken of any rise or fall of the ground. The cottage illustrated in the inset sheet is situated a short distance out of Penshurst, to the westward, and the chief feature in its design is the splendid chimney. The arrangement of the lighting of the first floor is very successfully treated, whether considered from the outside or from the inside; and the colour result is good, the stone and brick being well disposed in the lower part of the chimney stack—the tile hanging, plaster and shingles, doing their work in the gable and elsewhere. The sketches were made in 1892.

Concrete Cottages. People have been waking up to the fact lately that the country has its housing problem as well as the town, and it is interesting in this respect to refer to the correspondence that has been going on in the "Spectator." Mr. J. Boyd Kinnear supports the use of concrete as a cheap and useful material for cottage building, and he points out that the cost of a pair of cottages with two living rooms, three bedrooms, scullery, washhouse, and all complete is £254, while dwellings with less accommodation and of plainer construction could be built in pairs or a row for less. The housing problem in the country is purely a matter of rent, and while the labourer must have a healthy house to live in the landlord receives such little rent that he cannot afford to build one. In the north of England and Scotland from 18s. to 22s. a week with a good house and garden rent free keeps the labourer on the land, in spite of the attractions of manufacturing towns, while 14s. a week, with 2s. to pay for rent, drives the young men into the towns in the South country. To make farming pay the labour must be good, and in the South of England the farmers often complain that the men are not worth the wages they get. In agriculture as in everything else low wages mean poor work, and if the wider introduction of concrete as building material leads to better cottages being erected, something will have been done towards inducing the labourer to remain on the land. It is an unfortunate fact that so many flock from the country into the town where they only serve to swell the already serried ranks—if not of the unemployed, then of the hum-drums.

Views and Reviews.

A CATALOGUE OF PAINTINGS.

This catalogue is a distinctly valuable one. It is neatly got up on good paper, and has a large number of illustrations. The catalogue is arranged alphabetically under the painters' names, so as always to be of use, notwithstanding any change in the position of any of the pictures. Mr. Whitworth Wallis, F.S.A., the keeper of the Museum and Art Gallery, and Mr. Arthur B. Chamberlain, his assistant, who compiled the catalogue, have greatly added to its interest by giving biographical notes of each of the painters, and descriptive notes of the exhibits. The collection is rich in paintings of architectural interest, and the Pre-Raphaelites are well represented.

"City of Birmingham Museum and Art Gallery: Illustrated Catalogue (with descriptive notes) of the permanent Collection of Paintings in Oil and Water-Colours, and the Collection of Statuary and the Pictures at Aston Hall." Compiled by Whitworth Wallis and Arthur Bensley Chamberlain. Price 6d. Guild Press, Birmingham.

COLOSSAL STRUCTURES.

The author of this book has done wisely to state in his preface that he has no intention of placing before his readers a technical review of the progress of mechanical science during the present century, but that he simply aims at giving a popular *résumé* of those inventions and processes which have attracted the most attention. Otherwise, criticism might be more severe, for the difficulty of dealing with technical subjects so as to be intelligible to the ordinary person is one which, unfortunately, is very often ignored, with the result that statements are made which are quite inaccurate, superfluous or absurd. Though the range of subjects includes much that is quite outside the sphere of architecture or building, the book contains several chapters which would be of interest to our readers. The first chapter in the book, for instance deals with big business buildings. Though of late years we have been inundated with particulars of the "skyscraper," there are many details—practical details—given which few, outside American professional circles, would probably be acquainted with. In calculating the strains on tall buildings, wind pressure becomes an important item. If the building is more than 200ft. high and rather narrow, it is deemed safe to allow for a possible wind pressure of 30lbs. to the foot; if there is a tower or finial running still higher, an allowance of 50lbs. per square foot is made. To meet this pressure, angle-braces are put in, or extra wide plate girders are used at different points to stiffen the steel frame which constitutes the skeleton of the building. It will be remembered in connection with the recent fire at Hyde Park Mansions, that considerable difficulty was experienced with the water supply, which, as the outbreak was at the top of the building, was found to be inadequate. When it is considered that a building like this is quite a low one compared with one of the big American structures, it will at once be seen that special arrangements of an intricate character are needed for the supply of water to the latter. As the city mains are designed to supply only about four storeys, large tanks are provided in the roof so that the tenants may not experience annoyance by reason of freezing or overflowing. To avoid the first danger the tanks are surrounded by an attic connected with the top of the lift well, so that the spare heat of the building always collects around them. The danger of flooding is avoided by using curved connections, and by placing pipes away from the wall whenever possible. Mr. Cochrane says that it is possible to put up one of these colossal twenty-storey buildings within a twelvemonth, and, as a comparison, mentions that the dome of St. Peters, at Rome, took a hundred years to complete. The most tedious delay is that caused by waiting for the plaster to dry, as the partitions are made of hollow bricks, irregular in size, and these are laid level on one face and brought up true with plaster on the other, a coat of an inch or more being required in some parts.

Have we yet reached the uttermost limit to which the "skyscraper" can safely be built? By no means, says our author:—"It is difficult to form an opinion as to how much higher the big buildings of the future may rise, but it may be safely estimated that thirty, or even forty-storey buildings are to be expected within a score of years, and that it is mechanically possible to erect steel buildings a fifth of a mile in height, the only serious objection being the cost." The advantages of living at this height are very doubtful, and from an æsthetic point of view the prospect is an appalling one.

The largest completed bridge in the world is the Forth Bridge. As it is usual for our American friends "to go one better," it is not very alarming to hear that the great Scotch bridge is to be surpassed by the bridge planned to cross the Hudson at New York City with a single span, connecting the States of New York and New Jersey. This monolith, of which "there appears to be no doubt that it will be begun at an early date," will be of the suspension type, the clear span being 150ft. in height and 3,110ft. (nearly two thirds of a mile) in length. This is almost double the span of the Forth Bridge. The building of bridges is undoubtedly on the increase, and the author is of opinion that spans one mile long may be expected. The chapters on tunnels, canals, electric traction and gas manufacture are interesting, and the information, as a whole, is presented in a very readable and agreeable form. The book is well printed and profusely illustrated.

The title is, however, distinctly a bad one as it at once suggests a "wonderful" volume of that class usually presented to the good boy at the local school, or that which the proud parent buys for the development of his "really astounding" son—whose talent for engineering, though like an oasis in the desert, is such that the universe will no doubt hear of the amazing devices which are its only possible outcome. Besides, how such subjects as building can be included under the term "mechanism" is a mystery. R R. P.

"The Wonders of Modern Mechanism." By C. H. Cochrane. J. B. Lippincott Company, London. 6s.

For Electric Lighting at Salford the Corporation have made application to the Local Government Board for permission to borrow £398,683.

The Paris Underground Railway, when completed, will have twenty-three stations within a radius of about ten miles. It will not be open for its whole length in time for the opening of the Exhibition.

Stepney Parish Church, E., has been restored at a cost of about £4,000. A new side chapel has been erected, the galleries have been removed, the seats have been restored, and a new wooden floor has been put down. The bells have been rehung, the tower repaired, and the organ has been restored. During the progess of the restoration it was found that much good stonework remained in the walls, especially round the arches, which have hitherto been covered with plaster. This has now been removed, and the stonework exposed.

Bath Abbey Restoration.—At a meeting of the Executive Committee held at Bath Guildhall on December 7th, under the chairmanship of the Archdeacon of Bath, Mr. T. G. Jackson, R.A., the architect, was authorised to proceed with such work on the west front and other portions of the fabric as the committee felt justified in undertaking. It was announced that Mr. John P. Carrington, a native of Bath, now residing in London, had communicated with the architect his desire to have some part of the restoration done at his own expense, and he had expressed his willingness to undertake the cost of the carved canopies over the Apostles St. Peter and St. Paul at the west front. The cost is worked out at about £150.

CEILINGS.*

By L. A. SHUFFREY.

At the beginning of this paper the author explained that the early date which had been fixed for the reading of his paper had made it necessary for him to make use of such illustrations as he could procure in the time, and apply his remarks to them, although in some instances they were not the most suitable examples for his purpose. He was fortunate in being able to exhibit and refer to the fine illustrations of the later Renaissance period from Messrs. Belcher and Macartney's book. He reviewed the progress of ceilings in this country from the time of the introduction of the Italians by Henry VIII., referring to the ceiling of Bishop West's chapel in Ely Cathedral, which is quite Italian in the style of its ornamentation, although not far removed from British examples in its plan, also to the ceiling of Wolsey's closet at Hampton Court. The latter has wood ribs, with cast panels said to be of lead, the ornament of which is in the Cinque Cento style and gilt on a blue ground. It is formed of interlacing octagons with small bosses and cut leaves at the intersections of the ribs; the whole is small in scale, and on two sides of the room there is a frieze cut up into long and short panels, with ornament of the same character and a moulding beneath it on which in gold lettering is a Latin inscription.

In Henry VIII.'s great Watching Chamber the ceiling is of oak ribs deeply moulded, forming a star pattern with pendants, and the panels are of plaster with shields and badges in circular wreaths of Renaissance character. Although plaster was freely used during the Gothic period for plain surfaces, or in combination with wood ribs, as in the last-named example, he did not know of any ornamental plaster ceiling of entirely Gothic character. The late Mr. G. T. Robinson, in his introduction to Mr. Millar's book on plasterwork, says that a guild of plasterers was founded by Henry VIII. in 1501, and that Luca and Bartholomew Penni, Italian plasterers, were brought over by Henry VIII. to work at his palace of Nonsuch, and this introduction of the Italians appears to have given an impetus to the craft. This fan type of ceiling, probably suggested by the late Gothic fan vaulting, an example of which was close at hand in the Great Hall, became very general, being found as far north as Sizergh Castle in Cumberland, and a variation of it at Levens Hall, the oak rib being superseded by one of plaster. The date given in Mr. Law's book on Hampton Court of the great Watching Chamber is 1536.

Another type of plaster ceiling exists in a very dilapidated building at the back of St. Aldate's, Oxford, where it is divided into four compartments by cross beams cased with plaster mouldings, the soffits of beams having a very flat, ornamented waving band running each way from a terminal in the centre. The compartments are cut up by ribs 2½in. wide, and ornamented with flowers in the spaces. In the upper chamber of this building the roof truss, which in the ordinary way shows beneath the flat and pitched ceilings, is also cased with plaster ornament.

At Burford Priory, also in Oxfordshire, we again have the fan shape with pendants, but the rib has become wider, 6½in., and has a running vine ornament between the beads. The pattern repeats all over a large room with fearful regularity, and the cornice is a rude attempt to adopt the imported style. In the ceiling from the Reindeer Inn at Banbury we find a further development, the planning of the ribs is more complex and the ornament on both ribs and spaces better modelled and more in the foreign manner. In this room the wainscotting goes up to the ceiling with cornice of wood.

Elizabethan Ceilings.

During the time of Elizabeth and James I., ceilings showed the Dutch and German influence in their strapwork and shields. Examples might be seen from Audley End, Blickling Hall and Barnstaple, the last place being rich in examples, and giving the impression that it was an important centre of the craft at that time. In the fish ceiling at Audley End we see the pendants exaggerated to quite an alarming extent, and the details of a very mixed character. Elizabethan ceilings are given in Mr. Gotch's book from Broughton Castle, Canons Ashby, Chastleton, Charlton House, Wilts, Haddon Hall, Knole, and others, showing that a British school of plasterers had developed a style peculiar to this country.

In the examples referred to it will be noticed how much better is the effect produced by bringing the plasterwork down the walls in the form of cornice and frieze, as in the examples from Charlton and Audley End, rather than starting it horizontally from the ceiling.

This work, when closely examined, is found to be very rough in execution, and even allowing for successive coats of distemper, appears to have been so when executed. To attempt to copy this rudeness now is mere affectation, but by studying the old work much may be learnt as to variation of surface, and the way in which the ornament dies into the ground tending to produce that softness of effect which is so pleasing in the work of this period. The repeating network all over the ceiling has a rhythmic value, and assists production when cast from a mould, and variation can be procured by changing of centres or joining pieces.

Over the staircase at Burford Priory the ceiling shows a great change, both in design and execution. The design embraces the whole space in one composition and the ornament is all undercut, the mouldings are foreign, and the acanthus leaf is introduced with shells in the cornice. Probably the design was supplied by the architect in this case, and in the earlier examples the craftsman may have been responsible for both design and execution. In the church of St. Charles the Martyr, Tunbridge Wells, is a singular ceiling, dated 1690, composed of square panels, octagon coffers, and small saucer-shaped domes, and at Burwash, in the same district, another, dated 1699, both showing a considerable acquaintance with natural forms and an endeavour to represent them literally. The ceiling at Thorpe Hall, designed by Webb, is a fine example of broad handling, with bold yet restrained ornamentation, and within the legitimate possibilities of plaster work. The staircase ceiling at Ashburnham House, Westminster, and that of the saloon at Coleshill, both by Inigo Jones, are of the same general design, consisting of a large central ellipse bounded by a heavy band of fruit and flowers, lying on, but overlapping at the sides, the main rectangular compartment. The example from Coleshill appears too large in scale for the room, and the cartouches and swags in the frieze quite unsuitable for plasterwork. The development of this class of ceiling can be seen in illustrations from Belton House, Melton Constable, Eltham, and Groombridge, the foliated band in the last getting quite out of bounds and disfiguring what would otherwise be a fine ceiling. In comparing these ceilings it is well to note the various ways in which they leave the walls where the cornice of room forms part of the wainscotting, as at Thorpe and Groombridge; the effect is not so good as where the ceiling is brought down to the walls with a plaster cornice or cove, as at Melton Constable or Belton. It must be remembered that in some cases the plasterers were working by the side of Grinling Gibbons or his school, and were not unnaturally led away from the paths of virtue by the flowers and festoons which they saw around them. During Wren's time

Plaster Ceilings

were influenced very much by French work, and later, with some exceptions, lost their architectural character and became a field of meandering scrolls without any geometrical forms to hold them together, until about the middle of the eighteenth century a new departure was made by the brothers Adam, who introduced a new style and a new process. The style was founded on the Greco-Roman, and the process was the use of a composition for the ornamental portions instead of plaster of Paris. This being pressed into hard wood or metal moulds whilst hot was capable of producing the very thin ornament which we know as the Adam style, and was applied to woodwork as well as ceilings. In

Adam Work

the dividing up of the ceilings was generally satisfactory and the ornament not often overdone, plenty of plain ground showing; they also showed originality in the form of their ceilings, being very partial to the segmental arched form, and a desire to get away from the flat ceiling, which we might very well copy. The style may be suitably used for low or small rooms. The publication of the antiquities of Greece by Stuart and Revett was followed by ponderous ceilings of beams and coffers and highly-relieved pateræ, and in less important work by Greek cornices, with refined egg and dart, and honeysuckle ornaments, bringing us well into this century, and leaving us the plasterwork of the speculative builder as our only evidence of tradition.

We have hacked down the work of the speculative builder, and in its place are content with an architectural void, a blank area. Having taken this rough survey of ceilings from the time of Henry VIII., it would be well to consider how we can profit by this wealth of work left us by our forefathers.

Hints on Designing Ceilings.

In many cases expense prevents the use of ornamental ceilings, but surely there is some way of giving expression to the ceiling without elaboration. Remember that ceilings have to be viewed foreshortened, and ornament should be simple on that account, and as the light strikes them very horizontally slight relief will tell. Undercutting is not necessary, and rather takes away from the solidity of the work. As a ceiling can only be examined by the spectator bending his neck, elaborate subjects, or what may be termed high art, are out of place. The general contour of a ceiling should be arched, and this can be done by keeping the cornice as low down as the height of windows will permit, and rising with ascending mouldings or a cove to the highest plane in the centre. A coved ceiling is ineffective mitred four ways, unless ribs are introduced to show its form, but running the barrel shape through at each end has a good appearance and gives a good place in the end spandrils for ornament.

Groining the ceilings of passages and lobbies is most effective, as is seen in some of the town houses of the last century. If figures are introduced their heads should point to the centre of the ceiling. It frequently happens in planning that small rooms have to be made unduly high for floors above to range with those over larger rooms. This is a good opportunity for keeping the cornice of room low and giving the rest to the ceiling, and the proportion of the room is much improved thereby.

Whilst not wishing to see all ceilings elaborated, we should look to it that they are ornamental in that they complete the architectural expression of rooms of which they become the crowning feature.

Improvements at Elland.—The Elland District Council propose to borrow £1,168 for sewage disposal purposes, in addition to the £13,000 previously sanctioned, and £2,260 for the improvement of footpaths. An inquiry has been held.

A Parish Room at St. Mary's, Colchester, has been erected in Papillon Road from the designs of Mr. J. W. Start. The site measures 110ft. by 52ft., and the building contains a room 45ft. by 25ft., a class room 18ft. by 25ft., and a lobby 8ft. by 25ft., leaving room for further extension of the premises in the future. The building, which is constructed of red brick faced with Bath stone, is well ventilated and lighted, artificial light being supplied by a number of electroliers, presented by an anonymous donor.

---

* Resumé of a paper read before the Liverpool Architectural Society on December 4th, 1899.

Professional Practice.

Greenock.—A cinerarium has just been erected in Greenock Cemetery as a memorial to the late Lady Francis Caroline Cameron, whose death occurred at Balclutha in January last, by her husband Sir Charles Cameron, Bart., M.P. The mausoleum, which has its foundation on solid rock, occupies a commanding situation in the cemetery, standing in the higher portion of the ground, and only a short distance from the western entrance at Forsyth Street. It takes the form of a Greek temple and is built of white Carrara marble, the blocks of which were cut out and fitted at the quarries in Italy. The cinerarium is 15ft. high, 15ft. long and 12ft. wide, and the marble employed in its construction weighs 44 tons. An oval grass plot and a walk will surround the monument, entrance to which will be obtained by a little gate. The memorial is approached by steps entering under a porch supported by pillars and leading up to a door in heavy ornamental bronze. Sir Charles intends that the cinerarium shall henceforth be used as a family vault. The architect of the structure is Signor Paciarelli, of Florence, and the contractor is Mr. Alex. Amidei, importer of Italian objects of art, 20, Queen Victoria Street, and Fenchurch Street, London. Signor Paciarelli has a wide reputation as a distinguished architect, and is one of the most noted members of his profession in Italy. Among the many notable erections designed by him may be mentioned the Castle Mediovale in Lucca, and the funeral vault Pantillina in Petersburg, built for His Excellency Pelostotosky. This latter work was this year awarded first prize at Monsa in the competition annually promoted by the King of Italy and open to European architects, the monument securing the distinction of being the best one of the year. Signor Paciarelli has also designed many private residences of note, among which is the villa in Florence for the Count Hochberg.

London. — Messrs. Tillett and Yeoman, architects, surveyors and estate agents, of 32, Finsbury Pavement, recently sued Mr. Thomas A. Sharp for £14 14s. for professional services rendered. Mr. Thomas Tillett, a member of the plaintiff firm, said that in the beginning of the year they were applied to by the defendant to investigate the stoppage of drains on the defendant's premises. An inspection of the drains was made, and the charge of £14 14s. for almost daily superintending the work in progress was fair and reasonable. Under the scale allowed by the Institute an architect could charge by time upon small jobs. In the present case he had charged the defendant by time. It was not customary for the architect to inform the client when work was charged for by time and when by percentage. For the defendant, Mr. A. M. Hiscocks, civil engineer to St. George's Vestry, Southwark, said that the ordinary percentage in the scale of charges was the usual charge for drainage work. In the event of finding that such a scale did not pay for a particular job he should inform the person employing him that he would charge him differently. Upon examining the plaintiff's account he should think that a sum of £5 5s. would be sufficient for the work done. In addressing the jury, defendant's counsel said that his client had refused to pay the account because of the manner in which it had been made out. He had been charged 17 per cent. or 18 per cent. upon the total value of the work done. There was also an item which he (counsel) would draw the attention of the jury to. The item appeared after all the work was done, and was as follows: "To writing to Sharp as to the future use of the drains, and enclosing our account, 10s. 6d." The jury could not agree, but the parties agreed to accept the verdict of the majority, who found that the plaintiffs were entitled to be remunerated under the 10 per cent. scale. Judgment was entered for the plaintiffs for £8 14s.—On December 5th, in the High Court, Mr. G. G. Pye, an architect, sued Mr. C. H. Fry for £188, the balance of fees in respect of preparing plans for the rebuilding of the Gresham Restaurant in Gresham Street, of which the defendant was the proprietor in 1897. Being desirous of rebuilding, the defendant was introduced to the plaintiff and instructed him to prepare the plans. The defendant desired to raise about £15,000 upon the premises in order to pay off £6,500 already secured upon them, and to meet the expense of the new buildings and other expenses. According to the plaintiff's case, the defendant asked him to procure loans of £10,000 and £5000, to be charged as a first and second mortgage respectively on the premises. The plaintiff introduced the matter to Messrs. Bass and Co., but the negotiations fell through owing, as the plaintiff contended, to the fault of the defendant in not complying with that firm's reasonable requirements. The plaintiff, in addition, found successively three other persons who were prepared to advance the £10,000, but the negotiations failed, and the defendant ultimately sold the premises as they stood for £8,000. The defendant's case was that it was agreed between them that the plaintiff should only be entitled to be paid his fees if he succeeded in procuring the loan of £15,000. The jury found for the plaintiff, and judgment was given accordingly.

New Patents.

These patents are open to opposition until January 15th.

Utilising Sewage.—23,562. W. R. Hutton, junr., Whiteinch. The dried sewage is fed into a retort. The char or coke is recovered at the bottom, as residual products, while the volatile products are carried away and treated for use as illuminating gas, or for the recovery tar, oil, or ammonia.

Drying Bricks.—24,188. M. Villaret and J. B. Wahlen; both of Germany. To prevent cracking, air is first let in at a low temperature and containing a certain moisture. Then the heat is raised gradually until the air current is perfectly dry and of the highest temperature. The drying room is specially arranged to effect this result.

Brick Making.—27,173. J. Rowe, London. To prevent shrinkage, an oxide from which sulphur has been taken for manufacturing purposes is added to river mud or clay, and, if desired, sand may be incorporated, though in this case the quantity of oxide is reduced. About equal quantities of mud and oxide are used.

Floats.—27,396. J. Wellard, Grays. In ordinary ball floats two hemispherical cups are soldered together and, owing to immersion, the solder is subject to galvanic or corrosive action. To prevent this the float consists of a hollow vertical cylinder having a hemispherical bottom and a flat cover soldered on—the joint being clear of the water.

1899.—Attaching Door Knobs.—1,178. A. Ashworth, Eccles. The spindle is drilled in the end and tapped to receive a screw which is inserted after the knob has been put on. The spindle is square. In a modification it is tapped on the outside, and the screw has a thread inside. In another modification both methods are employed.

Protective Coverings.—J. C. Sellars, Birkenhead. For preventing corrosion or damage from heat or water, metal surfaces, such as iron or steel, are first brushed over with a suitable cement, applied like paint. When this is dry a paint consisting of pigment and a mild adhesive (milk, glue solution or albumen) is applied. Lastly, a covering of silicate of soda or potash is put on. Sometimes this is covered with vaseline, paraffin wax, black varnish, &c. Several modifications are included in the invention.

Drawing Curves.—6,306. Dr. L. Cerebotani, Munich, Germany. This invention relates to an elaborate machine, consisting chiefly of two bars turned on a common axis and having longitudinal motion regulated by rack and pinion, for drawing all sorts of curves and spirals. It is operated by a handle working through gearing. The device is too intricate to describe here.

Lustreless Paints. — 11,957. A. Turski, Warsaw, Poland. To ordinary oil colour is added about 30 per cent. of powdered kaolin and about 25 per cent. of purified oil of turpentine. This produces a paint which, when applied, dries with a perfectly matt surface.

Joints without Solder.—14,546. F. G. S. Ham, London, S.W. The end of the soft metal pipe is splayed and fitted with a tapered or corrugated ferrule inside. Outside is another ferrule, which may or may not be threaded, held in place by a screw collar. Packing washers are provided in some cases, and the end of the pipe is burred over to form close joints. No solder is needed.

Light Refractors.—16,623. C. E. Manning, Chicago, U.S.A. The frame of the skylight or window is of wood, and is filled with rectangular strips of glass placed slanting downwards. Instead of grinding the edges, powdered glass is sprinkled over and melted there, so that the surface on each side is quite smooth. Sometimes the glass strips are placed horizontally one above the other, with the edges rough; a soluble glass is then applied.

Fastening Pipes to Walls.—18,407. E. M. Edwards, Stratford, Essex. Cast on or attached to the back of the pipe is a projection having splayed sides. This fits into a correspondingly recessed projection on a back plate, which is fastened to the wall in the usual way. The pipe is given a turn to lock the joint, and is held in place by a pin.

Artificial Stone, Bricks, &c.—20,139. A. Catkosinski and L. Weintraub; both of Germany. Two parts of hydraulic cement and about four parts of coal waste or slack are mixed together and moistened with water; the mixture is then compressed in moulds. The material is very light, and is a bad conductor of heat.

The following specifications were published on Saturday last, and are open to opposition until January 22nd. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—17,696, Swan, kilns for burning cement-making materials. 17,758, Weiss (*Preble*), automatic lathes or machines for turning or shaping wood, &c. 24,086, Laffan and Bury, production of marbled surfaces on glass, &c. 24,145, Puddephatt, apparatus for raising, lowering, and traversing or transporting loads. 24,211, East Ferry Road Engineering Works Co., Ltd., Tuckett, Locke, Lancaster, and W. W. and R. Johnson and Sons, Ltd., and Johnson, means for drying white lead. 25,876, Restall, apparatus for cleaning and repairing drain pipes. 26,097, Restall, apparatus for cleaning, painting, and repairing the interior of drain pipes or conduits. 26,562, Jensen (*Kemlo*), wire ropeways. 27,107, Atkin, construction of cutter blocks for wood working machinery. 27,118, Ingham, waterproof material for bridges, viaducts, flat roofs, footways, cycle tracks, &c.

1899. — 942, Mason and Mason, public urinals. 1125, McHardy and Froy, ventilating apparatus. 1161, Foster, gas burners for stoves, grates, &c. 1275, Illidge, construction of sash fasteners 1302, Grabau, cements. 1396, Williams, hinges. 1704, Stidolph, fastening of tapes for Venetian and similar lath blinds. 3659, Roger, heating and lighting apparatus. 5095, Rubens, keys and keyholes for door locks. 13,263, Roberts, fireplaces. 14,497, Schmidheiny, edge runner mills for crushing clay, &c. 15,122, Hepworth, chimney top. 19,168, Vaughan, continuous burning kilns for burning bricks and other clay goods, and also for limes and cements. 19,543, Timar, heating apparatus. 19,545, Schwinning, pavement lights and daylight reflectors for cellars, &c. 20,166, Gibbard, wood block flooring.

Keystones.

St. Mary's Church, Leicester, is to be restored.

Leeds Parish Church Organ has been renovated and rebuilt.

The Fish Market, Aberdeen, is to be extended at a cost of £4,663.

New Schools at Kemp Town, Leicester, have been built by Messrs. George Lynn and Sons.

At the Royal Military Academy, Woolwich, a new stained-glass window in the dining hall has been unveiled.

A new Fire Station at Islington, N., is being built in Upper Street at a cost (including the site) of between £20,000 and £21,000.

Charing Cross Hospital is to have a new wing, which is estimated to cost £75,000; but £50,000 is still needed before this addition can be made.

The New Post Office at Arbroath is rapidly approaching completion. It is intended to have the sorting office ready by December 18th.

A Laundry at Romford Workhouse is being built for the Board of Guardians from designs by Mr. R. L. Curtis, of 119 and 120, London Wall, E.C.

The Foundation Stone of Galway Rectory was laid recently. The architect is Mr. William N. Binns, and the builders are Messrs. J. Emerson and Sons.

Church House, Westminster.—The builders are now engaged upon the second block of the permanent buildings of the Church House in accordance with the plans revised by the late Sir Arthur Blomfield. It is estimated that the cost will be £20,000, towards which about £11,000 has been contributed or promised.

Sir Henry Tate died on December 5th at the age of eighty-one. The first design for the National Gallery of British Art, and that of the building as completed (full-page illustrations of each of which were given on one of our inset sheets last week) are, therefore, of special interest at this time. He was buried on Saturday in the family mausoleum at West Norwood.

A Handsome Drinking Fountain.—As a memorial to their late mother, Mr. Thomas Smith and Mr. Walter Smith, of Christmas cracker fame, have presented to Finsbury one of the handsomest drinking fountains in the metropolis. It is of François Premier style, and stands in the south-west corner of Finsbury Square, and has been designed and carried out by Messrs. J. Whitehead. Carrara marble, granite and stone have been employed, and no less than 200 pieces of such materials have been required.

A Crematorium at Leicester is proposed to be built. At the recent Local Government Board inquiry Mr. H. L. Goddard, the architect, submitted the plans of the building which, he explained, would adjoin the chapels already sanctioned. As regards cost, the extra amount to be added to the sum already sanctioned, if the crematorium were attached to the chapels, would be £3,000, as against £7,250 if the crematorium were erected separately with its own chapels, as in the original schemes.—There was no opposition.

Art Results in Hull and Manchester.—Some interesting figures comparing the art results at the Hull School of Art and that at Manchester have been published. In decorative painting and design, at the Manchester school 16 were marked first class, 33 gained second class, 43 failed; whilst in Hull 20 were marked first class, 7 gained second class, 3 failed. In historic ornament, architecture, and geometry, Manchester shows 114 marked first class, 54 gained second class, and 114 failed. Hull's figures are 25 marked first class, 6 marked second class, and no failures. The figures are very gratifying to the supporters of the Hull school, and afford cogent reasons for building a proper art school for the city.

The Manchester City Art Gallery is proposed to be extended.

A new organ at Norwich Cathedral has been provided. It has an oak case and gilt pipes.

New Congregational Chapel and Schools at Crookes, Sheffield, are being built at an estimated cost of £3,250.

A New Infirmary at Leyton is being erected from designs by Mr. Francis J. Sturdy, of 44, Finsbury Pavement, E.C.

At the Northampton Institute, Clerkenwell, E.C., last Friday, Sir Henry Roscoe distributed the prizes and certificates.

A Proposed new Wesleyan Chapel, in Leeds, at Beeston Hill, is estimated to cost about £2,000, and a fund is now being raised.

Mr. Charles Perrin, M.I.C.E., has been appointed water examiner for the purposes of Section 36 of the Metropolis Water Act, 1871.

A huge Timber Fire occurred on Saturday at Messrs. Haggis and Sons' sawing and planing mills at King's Cross, W.C. Messrs. John Mowlem and Co.'s premises were also involved.

The Estate of the Late Sir Arthur W. Blomfield, A.R.A., has been valued at £28,006 12s. 2d. He bequeathed his architectural books and instruments and works on art to his sons, Charles James and Arthur Conran.

A new Steam Laundry at Tee-side, Middlesbrough, has been built from designs by Councillor W. G. Roberts, of 61, Albert Road, Middlesbrough, and will give employment to about 200 hands. Mr. J. H. Smiles was the contractor.

Proposed new Town Hall for Norwich.—The Norwich City Council, at a special meeting on Friday, rescinded a resolution passed on September 29th, directing a committee to prepare a scheme for the erection of new municipal buildings. The cost of the scheme was set down at £100,000.

The Late Mr. Septimus Potts' practice and all his papers have been transferred to Mr. J. C. Parkinson, solicitor, of Imperial Chambers, 62, Dale Street, Liverpool, who is also authorised to receive all accounts due to the estate of the deceased. The deceased was a solicitor, of No. 5, Cook Street, and formerly also of York Buildings, Dale Street, Liverpool.

Bursting of a Wheel.—On Thursday last at a brick works at Kettering a large driving wheel burst. Heavy masses of steel crashed through a floor and broke down the adjoining walls. One man was struck on the head by a piece of flying masonry, and two pieces of steel weighing 4cwt. dropped on either side of another man. These pieces were found embedded in the ground to a depth of 3ft.

The Court Room, Scarborough—The Justices at Scarborough passed a resolution recently that the present accommodation for the Petty Sessions was inadequate. The court room at Scarborough is at present at the Town Hall in Castle Road. Under their scheme for adapting St. Nicholas House to municipal purposes, the Corporation are providing for the removal of the council chamber from Castle Road to St. Nicholas House, but are not proposing to transfer the courts to the new premises.

Royal Academy Prizes.—On Saturday Sir Edward Poynter presented the prizes to the Royal Academy art students. The chief prize, the gold medal and travelling studentship (£200), was awarded to Mr. Frank Moss Bennett. The Turner gold medal and scholarship for landscape went to Mr. F. Appleyard, who also took four other prizes. The gold medal and travelling studentship for sculpture fell to Mr. Gilbert W. Bayes (Æneas leaving Troy), and the similar distinction for design in architecture to Mr. Horace C. Hide (design for public school). The design for the decoration of a portion of a public building (Spring driving out Winter), which secured a prize of £40, was by Mr. Appleyard. Miss Florence E. Chaplin and Miss H. E. Thomas received the silver medals for the draped figure, and Misses Gertrude Lindsay, Winifred Hunt, and Mary C. Buzzard were awarded medals in other compositions.

A collection of Pictures by Mr. J. L. Thaddeus have been secured for exhibition at the Crystal Palace. The proceeds go to the War Fund.

A new font and cover has been placed in the church at East Allington, Devon. It is designed in the thirteenth century style and is of marble and alabaster, with a carved oak spiral cover. The work has been executed by Messrs. Harry Hems and Sons, of Exeter.

Foulden Parish Church, Berwick, after being renovated, has been re-opened for public worship. It is well known on the Borderland as the place where the Commissioners of Queen Elizabeth met the Commissioners of James VI., King of Scotland, to give explanations regarding the execution of Queen Mary.

For Preserving—not Restoring—Aston Hall, Birmingham, £705 14s. 8d. has been subscribed and handed to the Lord Mayor, who proposed a vote of thanks to the donors at the last meeting of the Birmingham City Council. In connection with the proposed extensions of the fire stations, it was stated that, since 1892, 20,841 buildings had been erected in the city.

"Ellipse by Compasses."—We regret that in this article, published on page 270 of last week's issue, there are some typographical errors. The letter "*z*" was substituted for "*g*," and in several instances the distinguishing mark (′) was omitted, "*g*" being substituted for "*g′*," and so on. We have no doubt, however, that our readers have been able to follow the description, despite these inaccuracies.

"Old Colonial Houses of the Cape of Good Hope" is the title of a book (royal quarto) issued this week by Mr. Batsford, in which many of the quaint and picturesque buildings erected by the early Dutch settlers are illustrated from sketches in pen and ink or crayons by Mrs. Alys Fane Trotter, and by half-toned reproductions from photographs. Mrs. Trotter's notes upon the subjects are accompanied by a short account of the "Origin of Old Cape Architecture," by Mr. Herbert Baker, A.R.I.B.A., with sketches by its author. Many good and typical examples of these old houses yet remain within a few miles of Cape Town.

Concrete on Fire.—A startling discovery was made last week that the concrete foundation, 8ft. thick, underneath two of the five boilers in the Chester Corporation Electric Light Works was a red-hot, burning mass. The fire did not spread to the concrete under the other boilers, and no sudden cessation of the supply of electric light was caused. The Corporation Lighting Committee have had several special meetings on the subject but are still investigating. It is stated that, in the case of the three boilers originally constructed, a layer of bricks separated the fire from the concrete below, and that in the case of the two boilers more recently added there was no such layer of bricks. However this may be, no effort will be spared to get at the bottom of the extraordinary affair, or to repair the mischief already done.

Rights of Light Again.—A man named Morton was sued for £1 11s. at the Mansfield County Court on December 5th by the Sutton-in-Ashfield Urban District Council for erecting property, in Short Street, Sutton, with windows overlooking land belonging to the plaintiffs. He was asked to pay an acknowledgement of 1s. per year to the Council, but this he refused to do, and the plaintiffs therefore blocked his light with a hoarding. The case turned on the point of whether a small strip or gusset of land existed between the defendant's wall and the public footpath. Morton said it did not exist, and as the hoarding trespassed on to his property by touching his building, he had it taken down. It was for this removal that the Council brought the case into court. In the end, his honour gave judgment for the plaintiffs for the amount claimed, but refused to grant an injunction against the defendant removing a hoarding, because he held that the one removed had infringed on the defendant's wall.

COMING EVENTS.

Wednesday, December 13.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. F. W Deas, M.A., on "Notes on Eleventh Century Buildings in South-Eastern Italy." 8 p.m.

SANITARY INSTITUTE.—Council Meeting at 5 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

CHELSFIELD (Kent).—For additions, alterations, and new sanitary arrangements at the Board Schools, Chelsfield, Kent. Mr. St. Pierre Harris, architect. Quantities by Messrs. Stanger and Son :—

Stebbings and Pannett	£2,042	W. Owen	£1,794
T. Knight	2,010	Somerford and Son ...	1,759
T. D. Graty	1,990	J. Smith, Chelsfield* ..	1,751
R. A. Lowe	1,949		

* Provisionally accepted.

FARNBOROUGH (Hants).—For the erection of a residence, Alexandra-road, for Miss Pincknay. Mr. W. E. Trevena, architect, Farnborough. Quantities supplied :—

Bottrill and Son	£2,362	McCarthy E. Fitt ...	£2,159
Martin, Wells, and Co.	2,300	Hawkin	2,005
Hooker	2,300	Hughes, Wokingham*	1,960
Kemp...	2,200		

* Accepted.

HAYDOCK (St. Helens).—For the erection of a factory for the Schwartzkopff Coal-Dust Firing Syndicate. Messrs. Charles H. Beloe and Frank E. Priest, engineers :—

Morrison and Sons	£6,000 0 0	Henshaw and Sons	£4,960 0 0
Roberts and Robinson ...	5,600 0 0	Neil and Sons ...	4,730 0 0
Thornton and Sons	5,195 0 0	C. Burt*	4,575 0 0
Holme and King	5,137 11 10	Holme and Green‡	4,450 0 0
J. Taylor‡	4,975 0 0	Jones and Sons‡	4,350 0 0

* Accepted. ‡ Withdrawn.

HENDON.—For the construction of 1,010 yards of 15in. pipe-sewer and 940 yards of 12in. ditto, together with manholes and flushing chamber, for the Urban District Council of Hendon. Mr. S. Slater Grimley, engineer :—

T. Adams	£5,499 6 6	James Dickson...	£3,770 16 4
E. H. Jackson ...	4,740 14 9	M. S. Ketteringham, Waltham Cross*	3,650 3 0
Killingback and Co.	4,577 17 5	J. and F. Binns (too late)	3,597 4 2
Ballard, Ltd. ...	4,456 9 1		
Pedrette and Co.	4,321 0 0		
Clift Ford	4,118 0 0		

*Provisionally accepted.

LONDON.—For road-making, tar-paving, &c., at the Western Hospital, for the Metropolitan Asylums Board :—

Wimpey and Co.	£3,300	Parry and Co.	£2,614
Thos. Adams.	3,287	Ballard, Ltd., Child's Hill*	2,452
C. Ford	3,065	Wainwright & Co.	Informal.
Bentham and Co. ...	2,749		
Grounds and Newton	2,680		

* Accepted.

[Surveyor's estimate, £3,185.]

LONDON, E.C.—For alterations at No. 3, St. Bride's-street, E.C., for Messrs. Thos. Cook and Son. Mr. Frank E. Smee, architect, 12, West Smithfield, E.C. :—

W. H. Lascelles and Co.	£2,393 0	James Smith & Sons	£2,234 0
Chas. Spreckley and Co.	2,352 0	J. Nixon	1,995 0
		H. and A. Lea* ...	1,992 10

* Accepted.

LONDON, E.C.—Accepted for alteration to shop, No. 3, St. Bride's-street, E.C., for Messrs. Iliffe, Sons, and Sturmey. Mr. Frank E. Smee, architect, 12, West Smithfield, E.C. :—

H. and E. Lea £227 10

PURTON (Wilts). — For the construction of covered service reservoir, Pavenhill, and other water supply works, for the Cricklade and Wootton Bassett Rural District Council. Mr. F. Redman, engineer, Newport-street, Swindon :—

J. & T. Binns ...	£2,396 0 0	Fleweeling and Huckson	£1,669 0 0
J. James	1,861 10 0	Smith and Son...	1,515 12 0
Bentham & Co.	1,845 16 0	A. J. Colborne ...	1,486 18 9
Smith and Watkins	1,712 12 6	Winchcombe, Wroughton, Wilts*	1,542 5 0
W. L. Meredith	1,691 19 6		

* Accepted.

WALMER (Kent).—For the erection of a residence on the Leith Estate, for Mr. W. H. F. Sanders. Mr. Edward W. Fry, architect, Cannon-street, Dover. Quantities by architect :—

	House.	Boundary Fences.
Hayward and Paramor	£2,139	£176 0
J. E. Turner...	1,996	160 0
Denne and Son	1,866	163 0

THE VENTILATION OF SEWERS.*

By D. S. DAVIES, M.D., M.O.H., Bristol.

IT is very necessary, in considering the question of sewer ventilation, to dissociate this entirely from the question of house-drain ventilation. I may state at once that in my opinion every house drain should be cut off from the street sewer by an intercepting trap, and the soil pipe properly ventilated in full diameter above the roof, and all other conditions observed to render the admission of drain air to the house impossible. It is unnecessary to take up your time by insisting upon the danger of drain or sewer air admitted into enclosed places, or upon the undoubted possibility of resulting septicæmia, erysipelas, or enteric fever; nor need we discuss the method by which the causal organisms, with difficulty separable from moist surfaces, get carried, under conditions of intermittent use and partial drying of drain contents or otherwise, by air currents into dwellings. Beyond this, is it necessary to ventilate the public sewer, that is to provide designed inlets and outlets so as to encourage air currents continuously and regularly throughout the sewer?

It is generally assumed that sewers must be ventilated, apparently with no greater reason than is to be found by following the analogy of house drains. A properly-constructed sewer does not admit of much deposit, so that little chance of decomposition occurs; but all sewers get fouled and the sides slimy, and are thus capable of smelling offensively under certain conditions of flow and temperature. Considerable smell from an open sewer need not indicate the evolution of volumes of gas, or a great increase of pressure.

As Dr. Francis Clark, of Lowestoft, has put it, "It is better to bottle a smell than to dilute and so 'purify' it by spoiling a large bulk of pure air, and there are better ways of dealing with sewage emanations than that of forcing them down the throat of the 'man in the street' by mixing them with the atmosphere we breathe."

I fully agree, too, with Dr. Clark's suggestions that the foul odours which emanate from open street grids must be confined to their proper place, the sewer. I agree with him also that in any form of sewer, provided the houses are properly disconnected, little or no ventilation is required, and fresh air inlets are a serious mistake; for the more fresh air you suck or pump into your sewers, the more fouled air will there be emanating at other points, and contaminating the atmosphere, without in any way benefitting the sewer or its tributaries.

If any shafts at all are required, an occasional upcast here and there would suffice to equalise pressure caused by unequal flow, admission of storm water, &c.; but even these appear to be superfluous, for should the sewer air pressure increase so as to pass the water seal of the intercepting trap, it finds immediate vent up the open soil pipe ventilator, and cannot enter the house. And where the street gullies admit storm water to the sewers, as in Bristol, a further safety valve through the water seal of these gullies is afforded, with this advantage, that the escaping air is washed as it bubbles through, and causes no offence on its escape into the open streets.

The only time, indeed, when in Bristol we get smells or complaints from the sewers is after prolonged drought, when the gullies dry, and our system approximates to that of a ventilated town; this is easily set right by sending a watercart round to fill up the gullies.

Secondly,—Is there medical evidence of the need for ventilation? In Bristol the sewers are totally unventilated; and as they have been so since they were constructed, it is a point of great importance to ascertain the ill effect, if any, upon the public health. For this purpose I prepared for the use of the Bristol Council the following analysis of the Registrar-General's ten years' returns (1887-96) relating to Bristol and certain other towns noted as generally healthy:

	All Causes per 1,000 persons living.	Infant Mortality per 1,000 births.	Per 100,000 living.		
			Fever.	Diphtheria.	Diarrhœa.
Thirty-three Great Towns	20·6	167	20	29	84
London	19·9	155	15	45	67
Bristol (including Clifton)	18·9	146	11	13	49
Brighton	17·7	149	11	18	66
Croydon	14·5	126	11	32	46
Clifton (from local returns)	13·8	115	8	6	21

Here are the death rates from all causes, the infant mortality (per 1,000 births), and the death rates from fever, diphtheria and diarrhœa, which may reasonably be looked to as indicative of good or bad sanitary condition. Ten years is a reasonably long period, enough to equalise results and prevent accidental error. Croydon is chosen for comparison because it has the lowest general death rate of the thirty-three great towns, is with good reason proud of its healthiness, and is a "ventilated" town; so is London, and so are most, if not all, of the thirty-three towns. Brighton is included for similar reasons.

As to general death rate, that for Bristol, while below the rate for London and the thirty-three towns, is higher than that for Croydon and for Brighton; but the Clifton rate is below that for Croydon, and considerably below that for Brighton.

As to Fever.—The rate for Bristol (unventilated) is exactly equal to the rate for Croydon (ventilated), and is also exactly equal to that for Brighton (ventilated). So far as the important question of fever mortality is concerned, then, towns using exactly opposite systems as to sewer ventilation are upon an equality. The rate for Clifton (unventilated) is considerably below the rate for Croydon, and equally below the rate for Brighton. The fever rate for Bristol and Clifton are both markedly below the rate for London, and for the thirty-three towns. As Bristol is an old, densely populated, and closely built city, the fever rate might be supposed to be in excess in comparison with Croydon, especially if unventilated sewers had any ill effect, but it is equal to it, and that for Clifton is much lower.

As to Diphtheria.—The rate for Croydon (ventilated) is more than double the rate for Bristol (unventilated); and more than five times the rate for Clifton (unventilated). The rate for the thirty-three great towns is more than double the rate for Bristol, and the London rate is more than three times as large as that for Bristol. The rate for Clifton is less than half the Bristol rate, less than a quarter the rate of the thirty-three towns, and is less than one-seventh of the London rate. Brighton shows a diphtheria rate higher than that for Bristol, and three times as high as the rate for Clifton. (Clifton forms part of Bristol.) Some increase in diphtheria mortality has of late years been observed in Bristol, as in other large towns, but in far less degree. It is obvious that, if the increase of diphtheria in Bristol is to be attributed to the unventilated condition of the sewers, the far greater increase in other towns may with equal reason be ascribed to the ventilated condition of their sewers; the healthiest of these towns show diphtheria mortality rates which are from three to five times as high as that for Clifton.

As to Fatal Diarrhœa.—The rate in Bristol is 49 (per 100,000), as compared with Croydon's 46, with Brighton's 66, with London's 67, and with the thirty-three towns' 84. The Croydon rate, 46, is more than double that for Clifton, which is only 21.

Infant Mortality.—That for Croydon, 126, is very favourable; but Clifton is considerably lower, 115. The Bristol rate, 146, is the next lowest of the thirty-three great towns, which collectively show a rate of 167, and is below Brighton, which is 149, and London, which is 155.

These figures for ten years show that old Bristol need not fear comparison with a new town (Croydon), somewhat remarkable for healthiness; or with other great towns generally, or with London. Clifton (including a populous working-class district in the Hotwells) stands far above these towns for general health, and especially for its freedom from fever, diphtheria and diarrhœa.

---

[*] A paper read before the Annual Congress of the Sanitary Institute, held at Southampton on August 29th, 30th, and 31st.

LLANDUDNO MUNICIPAL BUILDINGS.

AN IMPORTANT CASE.

IN the Chancery Division of the High Court of Justice on December 5th, 6th, and 7th, Mr. Justice Cozens-Hardy heard the action brought against the Llandudno District Council by Mr. Samuel Warburton, builder, Miles Platting, for 15 per cent. profit on a contract entered into by him to erect the new municipal buildings at Llandudno for £13,800, and for £500 damages from the defendants for turning him out of the site. The defendants contend that the plaintiff revoked the contract by refusing to furnish the architect with a sealed copy of the original estimate duly verified. Mr. Astbury, Q.C., and Mr. Taylor appeared for the plaintiff, and Mr. Eve, Q.C., and Mr. Hewitt represented the Llandudno Council.—The plaintiff stated that he had been a master builder for nearly forty years, and had constructed works for the War Office, the Post Office, and various railways and corporations in the North of England. He tendered for this work in October 1898, and he obtained a bill of quantities from the defendants' surveyors. He received in due time a notice that his tender had been accepted, and at the end of November he received from the town clerk a copy of the contract. He insisted on the word "sealed" being inserted in the paragraph relating to the furnishing of a copy of the original estimate to the architects. The original estimate was not required by the person employing a builder until the squaring-up for alterations and additions, and there was no object for which the architect or surveyor could desire to see the estimate until the contract was completed. It was unfair that the architect or surveyor should see the original estimate before deciding on what additions there should be. The copy which was furnished the defendants was verified by Messrs. Lees, chartered accountants, and he was of opinion that that was a sufficient verification under the terms of the contract. The architects did not tell him that he was not to commence the work until the copy was furnished to them, but they pressed him to get on with the building. He put upon the site materials which cost him £78. He offered to allow Mr. Connolly, the town clerk, or Mr. Lockwood, of Chester, to verify the copy. In other contracts he had entered into he had never been asked to verify the copy. While he was on the property he was ready and willing to go on with the contract properly and reasonably, and he had never refused to carry out any term he was bound to carry out. He claimed £500 damages because persons might see that his tender was accepted, and then another builder would have his tender accepted, and it might be thought that it was through negligence or defect on his part that he had not been allowed to go on with the work. He certainly thought he had been injured by the defendants' proceedings.—In cross-examination, the witness said it was an uncommon thing to require the sealed copies to be sent in with the tenders, but it was sometimes done. He objected to any quantity surveyor who had an interest in the building, or power of making alterations, seeing his prices and so being enabled to pick out the plums and leave the stones.—Mr. John Holden, architect and surveyor, said that in his experience there was nothing that the copy of the estimates could be required for except the purpose of adding up the extras at the end of the contract. He thought £500 was a small amount to put down as damages, and though 15 per cent. of profit might be a reasonable sum he could not say whether the plaintiff would have made so much.—For the defence Mr. Eve submitted that by the contract there was to be a verified copy of the original estimate for the sole use of the architect and surveyor appointed. The object of that was that it should be deposited in such a manner that it should not be available for anyone but the architect and surveyor.—Mr. Justice Cozens-Hardy asked what ground the defendants had for importing into the contract that the copy was to be verified by the architect or quantity surveyor.—Mr. Eve said that that would be done for the protection of the employer, whose architect was entitled to look at the estimate, and if the plaintiff came to the court for damages and said he handed the copy to the defendants on the promise that it should not be looked at, that disentitled him to damages. Further, he submitted there never was any verification within the meaning of the clause in the contract, and that verification should be done not by an accountant, but by the contracting parties.—Mr. Alfred Connolly, town clerk of Llandudno, and Mr. Thomas Silcock, the architect of the building, were called for the defendants, the latter stating that owing to the great rise in building materials it was very doubtful whether the plaintiff would have made a profit if he had completed the building.

In giving judgment Mr. Justice Cozens-Hardy said that by the third of the general conditions it was provided that the contractor should, on the signing of the contract, furnish the architect with a verified sealed copy of the original estimate for his own sole use, and that of the surveyor appointed for the purpose of the agreement. There was a provision in the contract that extras ordered by the architect were to be paid for according to the prices set out in the original estimate. Plaintiff agreed if his tender was accepted to deliver to the architect, under seal, a fully priced copy of his bill of quantities in order that the value of any additional or extra work might be ascertained. The contractor prepared his estimate and priced it up, and he got an accountant, whose competence was not questioned, to examine a copy with the original, and he certified it as correct. The copy was then sealed and sent to the architect. The Llandudno Council took up a position which he was entirely unable to appreciate. They said the third clause meant that the contractor must not only furnish a verified or certified copy of his original estimate, but that he must furnish a copy which was verified by the quantity surveyor who had prepared the bill of quantities. What ground in reason or probability was there for inserting such a term as that? He entirely failed to see any justification for such an intention. Were the Llandudno Council right in refusing to allow the plaintiff to go on with the work and making a fresh contract on the ground that he had failed to furnish the architect with a verified sealed copy of the original estimate as provided by the contract? He thought the Council were wrong, and that Mr. Warburton absolutely and entirely complied with every obligation under clause 3 when he sent to them a sealed copy of the original estimate verified and certified. He, therefore, must make the declaration which the plaintiff asked for, that upon the true construction of the agreement the defendants were not entitled to require that a verified sealed copy of the original estimate should be further verified by the architect, and that being so, it followed that the defendants had been guilty of a breach of their contract with the plaintiff. The plaintiff claimed damages on the footing that he would have made a 15 per cent. profit on the contract, but that was too high a percentage, and having regard to the rise in the price of building materials since the contract was entered into, he would give judgment for the plaintiff for £1,000 damages for breach of contract. The plaintiff further claimed £500 compensation for damage to his reputation in consequence of the publication in trade and other journals that his contract had been cancelled. There was no allegation of misconduct on plaintiff's part, and he could see no justification for that claim. It would be wrong to mulct the defendants in special damages on the footing that plaintiff's reputation had been damaged by the publication of statements, not that Warburton was a bad builder, but that he was not as good a lawyer as the Urban District Council of Llandudno thought themselves to be. There would be judgment for the plaintiff, the defendants must pay the costs of the action, and the counter-claim would be dismissed with costs.

SUPPLYING COUNTRY MANSIONS WITH WATER.

At a recent meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, Mr. John C. Fell, president, in the chair, a paper was read on "Water Supply to Country Mansions and Estates" by Mr. Gordon Harris, A.M.I.C.E. He observed that the cost of supplying an estate with water by the antiquated methods of either manual labour or uneconomical steam engines was very high. A gravitation scheme was far preferable, provided the source of supply was not too far distant. The objections to manual labour were pointed out, and pumping by animal power was considered more economical than by hand power. A small steam engine was not desirable on account of the heavy fuel bill and cost of attendance it involved. A gas engine could rarely be used in country mansions owing to the absence of a gas supply, but where gas was available a gas engine was very advantageous. The oil engine was strongly recommended as possessing every advantage as regards its fuel supply, its simplicity, and its economy in working. The author then gave the following comparison of the cost of pumping 1,000 gallons of water to a height of 100ft. by various powers: (1) Hand labour at 18s. per week, 26·5 pence; (2) horse power, man at 18s. per week, 4·20 pence; (3) gas engine and pump, with gas at 4s. per 1,000 c.f., 1·44 pence; (4) small steam pump and boiler, with coal at £1 per ton, 0·75 pence; (5) oil engine and pump, with oil at 7d. per gallon, 0·70 pence; (6) electrically driven pump, worked from a lighting dynamo, 0·45 pence.

The cost of attendance is excluded in Nos. 3, 4, 5 and 6; in No. 4 an allowance should be made varying in amount with the total daily supply and other conditions, and an addition must be made for coal used in getting up steam. As the cheapest and most lasting water raiser, the author stated that the hydraulic ram still retained its popularity. Water wheels, hydraulic pumps and windmills were also discussed, and their respective advantages and disadvantages pointed out.

Examples were then given of the practical application of the mechanical agents referred to, and installations of various kinds on several estates and in large establishments were described and illustrated. Amongst other useful pumping appliances employed, the "Hatfield" treble barrel pump, manufactured by Messrs. Merryweather and Sons, was referred to. This pump could be driven at 700 revolutions or more per minute, and might therefore be coupled direct with an electric motor. It was stated that a number of these pumps were running in connection with water services, being driven by small high-speed oil engines as well as by electric motors. Another engine, known as "Squire's," had also been designed for special use on estates, and was applicable to general purposes as well as for water supply.

After referring to the question of well-boring, the author touched on the subject of locating water by divining, observing that some very curious successes had been achieved by that means, but at the same time he instanced a case in which he was consulted where the diviner's prediction had proved utterly valueless.

With regard to the important question of the utilisation of a portion of a water supply for fire extinguishing purposes, it was remarked that a large reserve must be secured for this purpose, and the author described various arrangements of fire-service that he had carried out in practice. These arrangements included gravitation and power systems. For meeting cases in which there was a deficiency of pressure the author had devised a very efficient automatic pressure augmentor, which he explained. In conclusion, the author observed that, failing the existence of the conditions necessary for a gravitation supply, or if the adoption of powerful machines was inadmissible for fire extinction, recourse must be had to the portable steam engine or to the less efficient manual engine, provided the source of supply was situate within a reasonable distance.

Masters and Men.

Aberdeen Joiners' Wages.—Official information was sent last week to the Aberdeen Operative Joiners by Mr. H. Peterkin, solicitor, secretary of the Master Joiners' Association, intimating that in consequence of the present state of trade the wages of the workmen would be reduced ½d. per hour, to take effect from April 1st. next. The present rate of wages is 8½d. per hour.

The Threatened Building Dispute at Bradford between the Master Plasterers' Association of Bradford and the Operatives' Society is now likely to be settled in an amicable manner. It will be remembered that the men demanded an advance from 8½d. per hour to 10½d. per hour, commencing from January 1st next, but as a result of negotiations an offer of 9½d. per hour, commencing on February 1st. has been accepted.

The Fair Contracts Question at Colne.—At the monthly meeting of the Colne Town Council it was decided that the following clause should be included in advertisements for tenders for work, and also in the conditions of future contracts :—"The contractor shall pay his workmen employed not less than the standard rate of wages in each branch of trade at the date of the contract, and in subletting any portion of his contract must see that the subcontractor adheres to this as far as possible."

Workmen's Compensation at Lanark.—Sheriff Fyfe gave judgment last week in a case under the Workmen's Compensation Act, in which Mrs. Catherine Walker or Macintosh, widow, Clyde Place, Motherwell, sued George Pirie, contractor, Nethanview, Lesmahagow, for £185 5s. as compensation for the loss of her son, who was killed while in defender's employment. The deceased while in the course of his employment at a railway viaduct at Lesmahagow met with an accident by which he was killed, and his lordship found that pursuer was partially dependent upon the earnings of deceased, and awarded £50 as compensation, with £5 modified costs.

The Blindness of Trade Unions.—Sir B. C. Browne says, in the "Engineering Magazine," that disputes as to wages between employers and workmen are of very much less importance than questions as to restrictions of trade and management of works. The settlement of questions as to the difference between piece and time work, of the questions of a greater number of machines being worked by one man, and, still more important, of the question of substituting machine for hand labour—these, and numberless other matters that are often in dispute in English workshops, are, therefore, far more vital than mere rates of wages. It is probably the case that, if the workmen could see their way to throw themselves heart and soul into the views of the employers in trying to economise the cost of work, they could get, with little or no trouble, a very large increase in their wages, make very much larger incomes, and having much more permanent work, with employment for a much greater number.

Sliding Scales for Wages.—Although trade union leaders have little liking for the automatic re-adjustment of wages from time to time in proportion to profits, it would be an immense gain to the kingdom if that method were adopted in all productive industries. In the extensive iron and steel producing area over which the Northern Conciliation Board exercises authority, the present year has borne fresh witness to the unmixed good resulting to employers and employees alike, from placing it beyond the power of both to employ coercion for either the raising or lowering of the wage-rate. Not a single strike or lockout, nor even any threat has occurred, although prices have been rising almost continuously throughout the whole period. As market rates increased, the wage rates correspondingly advanced, capital and labour thus sharing, on equitable terms, the enhanced prosperity of their joint labours. While, on the one hand, the market value of manufactured iron has now reached a higher level than during the last ten years, the operation of the sliding scale has given the workers a total advance of 12½ per cent. since the beginning of the present year, and they are said to be entirely satisfied with this handsome share of the augmented profits. Whether they would be equally content with the arrangement should prices fall, consequent on over-production, is a different question. The South Wales pitmen, it will be remembered, threw over the sliding scale because, in their opinion, it was more advantageous to employers than to employed.

Builders' Notes.

Belgian Contracts for British Work.—Extensive contracts for the supply of iron girders, &c., in connection with the construction of the National Harbour at Dover, have been secured by Belgian firms.

Smoke Abatement in Sheffield—At the Sheffield city Police Court on December 6th the Victoria Steam Laundry Company, Howard Street, were fined 30s. and costs for disobeying an order made upon them to abate a nuisance caused by their chimney.

The heating of the wards of the new "Alexandria" Hospital in Queen Square, Bloomsbury, W.C., which was recently opened by H.R.H. the Princess of Wales, was carried out by Messrs. Hendry and Pattisson, Ltd., of London, the system used being D. O. Boyd's improved warm-air Ward stoves and grates. The same firm have also recently completed the heating and ventilating, on D. O. Boyd's system, for the new isolation hospital, erected by the Enfield Urban District Council at Winchmore Hill. The East London Hospital, the North-Eastern Hospital, the Croydon General Hospital, and the Chesham Cottage Hospital have also been supplied with the warm air grates and ventilators, of which this firm make a speciality.

London County Council.—At the meeting of the Council held on December 5th, the report of the Main Drainage Committee, recommending an expenditure of £1,250,000, was adopted. This is part of the great main drainage scheme, which is estimated to cost nearly three millions of money and full particulars of which will be found on page cxvii. of the supplement to No. CCXLIX. of the BUILDERS' JOURNAL. The work will take twelve years to complete. Mr. Henry Ward, the chairman of the committee, said that the proposal to construct a separate set of sewers for surface water was now impossible, for it would involve an expenditure of £20,000,000, and a similar sum would be needed to put in surface-water drains to the houses. As information has often been asked about the York watergate in the Victoria Embankment Gardens, it was decided that an oak tablet should be placed near it bearing the following inscription: "This gateway, formerly the watergate or approach from the Thames to York House, Charing Cross, originally the London lodging of the Archbishops of York, the birthplace of Lord Chancellor Bacon, and afterwards the residence of George Villiers, second Duke of Buckingham, was designed by Inigo Jones, architect (1572-1652), and executed between 1624-28 by Nicholas Stone, master mason (1586-1647), for the first Duke of Buckingham, and marks the river margin before the embankment was constructed. The inscription on the north frieze, 'Fidei coticula crux' (the Cross is the touchstone of faith), is the motto of the Villiers family, whose arms are on the south front. By the London Open Spaces Act, 1893, the gateway was vested in the London County Council, who repaired the structure and took measures for its preservation *in situ* as an interesting landmark of London." After some discussion it was agreed to construct a lodging house for men on the model of the Rowton Houses, the site chosen being in Mill Lane, Deptford. The Council approved the action of the Improvements Committee in at once arranging for the widening of the Strand in connection with the Holywell Street block.

Surveying and Sanitary Notes.

The late Mr. J. C. Jonas, land agent and surveyor, of Great Shelford, Cambridge, died worth £43,988, 8s. 7d.

Insanitary Houses at Gainsborough.—Last week the Gainsborough Urban District Council condemned nine houses in Sailors' Alley, a *cul-de-sac* 17ft. wide, as being unfit for human habitation.

Engineer to the Birmingham Tame and Rea Drainage Board.—Mr. John Duncan Watson, sanitary engineer for the county of Aberdeen, has been appointed engineer to this Board at a salary of £800 a year.

Street Improvements at Halifax and the construction of new roads, for which the Town Council seek sanction to borrow £58,899, formed the subject of a Local Government Board inquiry last week. There was no opposition.

Town Hall Square Scheme at St. Helens.—It has been decided by the parliamentary committee of the St. Helens Town Council to apply to the Local Government Board for their sanction to the borrowing of £8,500, the amount estimated to be the cost of carrying out the scheme for making the Town Hall Square.

Bristol Improvements.—A Local Government Board inquiry was held last week into the application of the Bristol Corporation for sanction to borrow £15,300 for land for electric lighting purposes, £13,418 for baths, £11,745 for the Cheltenham Road Library, £6,358 for a sanitary depôt, and £155 for street improvement purposes.

Wakefield City Council Fined £100.—At the Wakefield County Court on December 5th, the town clerk (Mr. Hudson) applied on behalf of the Corporation for a further extension of the time allowed them in which to complete their sewerage works. Mr. Trevor Edwards, the West Riding solicitor, opposed the application, and asked the judge to enforce an order against the Corporation for polluting the river Calder. He said the County Council had no vindictive feeling against the City Council, but there had already been extensions of time and reasonable diligence had not been exercised by the Corporation. The town clerk said that, owing to the activity in the iron trade and other unforeseen circumstances, the contractors had been delayed, and found it impossible to complete the work in the time allowed. His honour ordered the Corporation to pay £100, the penalty not to be enforced if the work was completed and the nuisance abated within three months.

Projected Improvements at Scarborough.—A special meeting of the Scarborough Town Council was held on December 6th to decide as to the expediency of promoting a Bill in Parliament to empower the Corporation to make an approach road along the old town to the Marine Drive round the foot of the Castle Hill, and to alter the line of the sea-wall of the drive; to widen and improve the Valley Bridge, which connects the central part of the town with the South Cliff; and to construct a street tramway along the Foreshore from the Spa grounds in the south to Peasholme in the North Bay. It was decided to proceed with the Bill in the next session of Parliament.

Surveyors' Institution Examinations.—The Students' Preliminary Examination will be held on the 17th and 18th of January next. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland and Northumberland, at Manchester. Candidates from other counties in England and Wales will be examined in London, Irish candidates in Dublin, and Scottish candidates in Glasgow. The Students' Proficiency Examination will commence on the 19th of March next. Examinations qualifying for the classes of Professional Associates and Fellows will also commence on the 19th of March. English candidates for the Professional Examinations will be examined in London, Irish candidates in Dublin, and Scottish candidates in Glasgow. The next Special-Certificate Examinations in Forestry and Sanitary Science will be held on Tuesday, Wednesday and Thursday, the 12th, 13th and 14th of June next. Particulars of all the examinations can be obtained from the secretary at 12, Great George Street, Westminster, S.W.

A Case About a Stoppage in a Drain.—Mr. John Greenfield, a solicitor, appeared at the North London Police Court on December 5th on a charge of having disobeyed an order of the Court to abate a nuisance on his premises at 9, Quadrant Road. The Islington Vestry were the prosecutors. The case was that Mr. Greenfield's house and three houses adjoining were drained by a combined system into the main sewer. There was a stoppage in the drain, admittedly not under No. 9, but the Vestry summoned Mr. Greenfield because they contended that he had contributed to the nuisance by not agreeing to share in the cost of unstopping or providing his house with a separate drain. Mr. Greenfield was ordered to abate the nuisance on October 19th, since when the drain had been partially open. Mr. Fordham, in giving his decision, said that the contention of the defendant was that the order could not be enforced because the nuisance was not upon his premises; and, further, that the nuisance was in a combined drain, and upon land on which the defendant had no right of entry. All that, to his (the magistrate's) mind, was a quibble. He held that the combined drain was a part of 9, Quadrant Road, and that, a nuisance existing, it was the duty of the owner of No. 9, as well as the other owners, to share in the cost of the work. There would be a fine of £3 and £2 2s. costs; and if Mr. Greenfield was wise (added the magistrate) he would consent to pay his share of the necessary work.

Engineering Notes.

The new "Poplar Bridge" at Frizinghall, which connects the Shipley end of Frizinghall with the Crag end of Windhill, was formally opened last week. The bridge is of the lattice girder pattern and is 650ft. long and 7½ft. wide, having a plank flooring. Messrs. G. B. Smith and Co., of Glasgow, carried out the ironwork, and Mr. Robert Wood, of Bingley, the woodwork; the cost has been £1,250. The new bridge replaces an old, tortuous and dangerous footpath leading over the Bradford Canal and the Bradford Beck. It also passes over land purchased by the Bradford Corporation for the purposes of sewage treatment.

Institution of Civil Engineers.—At the ordinary meeting of the Institution held on Tuesday in last week Sir Douglas Fox, president, in the chair, it was announced that twenty-three associate members had been transferred to the class of members—namely, W. P. Abell, L. A. Bernays, jun., H. Blundell, A. Brebner, B.Sc., C. E. Brown, H. A. Brundell, G. B. Chalcraft, C. J. Crofts, H. S. Davies, J. Dewrance, E. W. Dixon, H. W. Hodge, S. H. Hunter, H. A. Mavor, R. G. Nicol, A. M. Paddon, C. S. R. Palmer, W. K. Parry, J. C. Peache, H. Pilkington, J. Swarbrick, W. Tower, and J. A. L. Waddell, M.E., B.Sc. It was also reported that 171 candidates had been admitted as students.

The Institution of Electrical Engineers held its annual dinner last Wednesday at the Hotel Cecil, when the president, Professor Silvanus C. Thompson, said that the Institution was about to form local sections in the provinces and in the Colonies to enable groups of members to hold meetings under the auspices of the society. Already such a local section had been in existence, informally, and had done good work in Cape Town. He referred to the offer of Mr. Wilde, of Manchester, to give £1,500 to a benevolent fund, and to the desirability of augmenting the building fund so that the Institution might very shortly provide itself with a home.

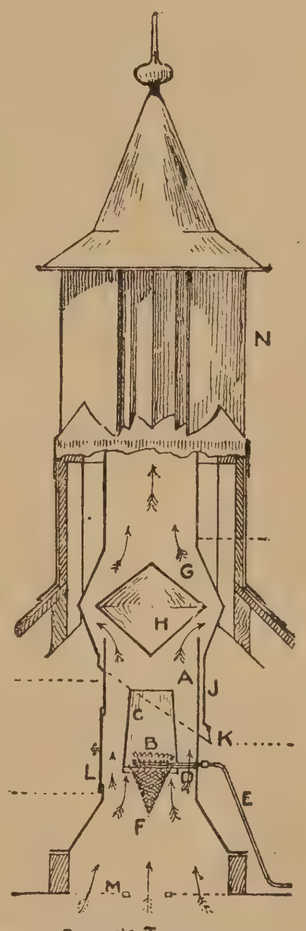
St. Helens Electricity Works.—At a special meeting of the St. Helens Electric Supply and Tramways Committee last week the electrical engineer submitted a statement showing the amount already expended on the electrical equipment of the tramways on the Prescot and Denton's Green sections to be £25,866. This was £866 in excess of the amount already authorised to be borrowed. The engineer also submitted his estimate of the cost of the electrical equipment of the Haydock and Peasley Cross sections, and of the extensions now being carried out.—It was resolved to apply to the Board of Trade for their sanction to the borrowing of the sum of £25,000, the total amount required for the purposes mentioned.—It was also resolved to apply to the Local Government Board for permission to borrow £20,000 to cover the cost for plant laid down and proposed to be increased at the Cropper's Hill power extension.

Death of a Southport Engineer.—Mr. James Robertson died at his residence, Holleth, Westcliffe Road, Birkdale, last week. He was born in 1821 at Farnell in Forfarshire, and received his training at Messrs. Randolph, Elder and Company's works, Glasgow. He subsequently became a partner in the firm of Messrs. Robert Laidlaw and Company, Glasgow, and after forty years residence in Scotland crossed the border and became associated with many important engineering firms in Birmingham, St. Helens, and Manchester. He was also at one time manager of the Camlachie Foundry, Glasgow. Mainly owing to his inventive faculties, many important improvements were affected in hydraulic machinery for the manufacture of tubes of all metals, and there are few concerns in the country which do not now avail themselves of Mr. Robertson's inventions. One of his last ventures was to establish the St. Helens Tube and Metal Company, which was subsequently disposed of to a Birmingham company known as Tubes, Limited.

Trade and Craft.

BOYLE'S THEROLITE.

The therolite is the latest patented invention of Mr. Robert Boyle, of Boyle and Son, Limited, ventilating engineers, of London and Glasgow, and is intended to assist the updraught in sluggish ventilating shafts and flues. It may be usefully employed in combination with the "air pump" ventilator for the prevention of condensation and the removal of exhausted steam from washhouses, laundries, drying-rooms, breweries, malt kilns, &c. It is also of assistance where ventilating shafts or flues are surmounted with ordinary cowls which fail to create a sufficient updraught and are subject to downdraught. When the "air pump" ventilator is employed, which creates at all times a powerful and continuous exhaust, the therolite is not so necessary. But when it is desired to make assurance doubly sure, it may be used in conjunction with the "air pump" ventilator, particularly for such buildings as mentioned above, as it superheats the cold steam or vapour at the point of exit and warms the ventilator and shaft, preventing condensation and accelerating the exhaust. The accompanying illustration shows the construction of the therolite: A, section of shaft of therolite 2in. larger than ventilating shaft; B, coil burner of improved construction, giving the maximum of heat with a minimum consumption of gas; C, cone for accelerating the velocity of the hot-air current; D, supporting rods; E, gaspipe; F, flame protector; G, expansion chamber; H, double spreader for deflecting the heated air on to the sides of the expansion chamber and diverting any down-current into the outer cylinder J, whence it passes through the valve K; the spreader also acts as a calorifier for superheating the up-current and further assisting the exhaust; L, door in shaft giving access to therolite (where the ceiling is not too high the therolite may be lighted from below by means of a taper and a long rod); M, ventilating ceiling panel, with opening in the centre to permit lighting from below; N, Boyle's patent "air pump" ventilator made fireproof. An arrangement may also be fitted to the burner to light the gas when it is turned on, thus doing away with the necessity and expense of a lighting jet or bye-pass.



BOYLE'S THEROLITE
as fitted to a Ceiled Roof.

Property and Land Sales.

FREEHOLD BUILDING LAND to be LET on LEASE, or SOLD in PLOTS; fronting on main road, and close to golf links and Highgate Woods; near Muswell Hill and East Finchley Stations. Liberal advances if required to responsible Builders.—For plans and particulars apply to Mr. GEORGE H. PAINE, Architect and Surveyor, 6, Stoke Newington Road, N. 8

REID'S BREWERY, Clerkenwell-road.—Further sale of the materials of this extensive pile of buildings.

MESSRS HORNE and CO. (in conjunction with Messrs. CHINNOCK, GALSWORTHY, and CHINNOCK) are instructed to SELL by AUCTION, in Lots, on the PREMISES, on Tuesday, December 19th, at Half-Past Twelve o'clock Precisely, the BUILDING MATERIALS of a very large Block, including Nos. 3, 10, and Middle Stores, extensive ranges of Malt and Hop Lofts, and Nos. 2 and 3, Ponto and Tun Rooms, including sound stock brickwork, excellent slates, timber, roofs and floors, heavy baulk girders and uprights, w. i. fireproof and other folding and sliding doors, c. i. tank, 24ft. by 33ft. by 3ft. 3in. flange and socket pipe, turned shafting, friction hoists, steel conveyors, several hundred tons of cast and wrought iron in useful girders and columns of various descriptions, granite paving, pitching, many tons of lead, also a quantity of loose brewery utensils, brads, screws, bolts, nuts, scaffolding, ladders, deals, firewood, &c. May be viewed on and after December 14th.

Catalogues had of Messrs. HORNE and Co., 8, Delahay-street, S.W., and 85, Gresham-street, E.C.

HARROW-ON-THE-HILL.—Three acres of eligible Lands abutting on main road, laid out for small villa or cottage residences, five minutes from town and schools and proposed railway station, TO BE LET on Building Lease, or FREEHOLD will be sold. —For terms and particulars apply to BENTWICH WATKIN WILLIAMS and GRAY, Solicitors, Corporation-chambers, Guildhall-yard, E.C.

STREATHAM.—Norfolk House Estate.—Important and valuable Freehold Property, with possession, containing about 15 acres and 24 perches, with frontages to main roads, and offering unequalled advantages for development as a building estate. By order of the Trustees under the will of the late Christopher T. Gabriel, Esq.

MESSRS. G. A. WILKINSON and SON will SELL by AUCTION, at the MART, on TUESDAY, DECEMBER 19th, at TWO precisely, the important and very valuable FREEHOLD PROPERTY known as the Norfolk House Estate, Streatham High-road, a magnificent position on high ground, within five minutes' walk of Streatham Hill Railway Station, about five and a half miles from the Royal Exchange and five miles from Charing Cross. The property, which has frontages to Streatham High-road of 589ft.; to Mount Ephraim-road of 530ft.; and to Mount Ephraim-lane of 974ft., is compact and capable of immediate development for superior residences, which are much sought after in this favourite suburb. There is an excellent mansion at present on the property, approached by a carriage drive, with lodge, and containing three reception-rooms, thirteen bed and dressing rooms, bath-room, and good domestic offices, stabling for four horses, beautiful pleasure grounds, ornamental lake, with boathouse; greenhouse, three vineries, &c., kitchen gardens, orchard, and park-like land, the whole containing about 15 acres and 24 perches.

Particulars and plan are now ready, and may be obtained of Messrs. MILLINGTON and DREW, Solicitors, No. 14, Great Winchester-street; and of the AUCTIONEERS, 7, Poultry, City.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum.

MODELS. — For Exhibitions or Law Cases.
Illustrations sent of Work Executed.
JOHN B. THORP, 98, Gray's Inn-road, W.C.

R.I.B.A., Society of Architects, and Civil Service Technical Examinations. Personal, correspondence, or resident preparation. Seventeen first places.—MIDDLETON and CARDEN, Associates R.I.B.A., 19, Craven-street, W.C. 1

APPOINTMENTS VACANT.

THERE is a VACANCY at small Terra-cotta Works near London for a thoroughly experienced KILN SETTER and BURNER, who can fill up his time at pressing.—Apply, stating terms, to "BURNER," Box 1,240, BUILDERS' JOURNAL Office. 1

ARTIST in Stained Glass and Leaded Lights to take chief position and act with principal in the management of a business in the North of England. Must be clever designer and experienced. The position will be an improving and permanent one.—State qualifications, age, and salary required, in confidence, to "North," care of Cowie and Co., 17, Gresham-street, London, E.C. 1

WANTED.—MARBLE FIXERS.—Hotel Russell, Russell-square, W.C.—Apply to "Foreman on Works." 1

WOLVERHAMPTON UNION.
ERECTION of NEW WORKHOUSE, &c.—
CLERK of WORKS REQUIRED.

The Guardians of the Wolverhampton Union invite applications from competent persons for the appointment of "Clerk of Works" in connection with the erection of their new Workhouse Infirmary, &c., under the direction of their Architect, Mr. ARTHUR MARSHALL, A.R.I.B.A., of King-street, Nottingham.

The person to be appointed must have had a wide experience in buildings of this character, and be fully competent to discharge all duties and responsibilities that will devolve upon him in connection with a large contract (say £150,000).

The salary will be at the rate of £350 per annum.

A suitable person will probably retain the appointment for three years at least.

Applications, stating age and particulars of Qualifications, and enclosing not less than three testimonials, must reach me not later than 9 o'clock on WEDNESDAY, the 27th inst.

Canvassing will disqualify a candidate.

By order,
FRANK HARRISON,
Clerk to the Guardians.
Union Offices,
Wolverhampton. 2

ROAD FOREMAN.—The Hampton Wick District Council requires a WORKING MAN as FOREMAN, experienced in road-making, sewer work, and scavenging generally. Wages to commence, 30s. weekly.—Apply by letter, stating age, with copies of testimonials and references, to J. NIXION HORSFIELD, F.S.I., District Surveyor, Hampton Wick, on or before December 19th.

APPOINTMENTS WANTED.

**YOUNG ARCHITECT, A.R.I.B.A.,

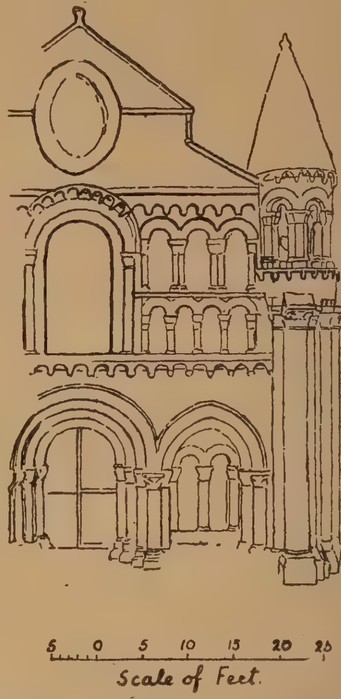
NOTRE DAME LA GRANDE: POITIERS: WRITTEN AND ILLUSTRATED BY T. M. ROOKE.

> "Look up and wonder
> At what the men did for us, who are dead."
> *William Morris.*

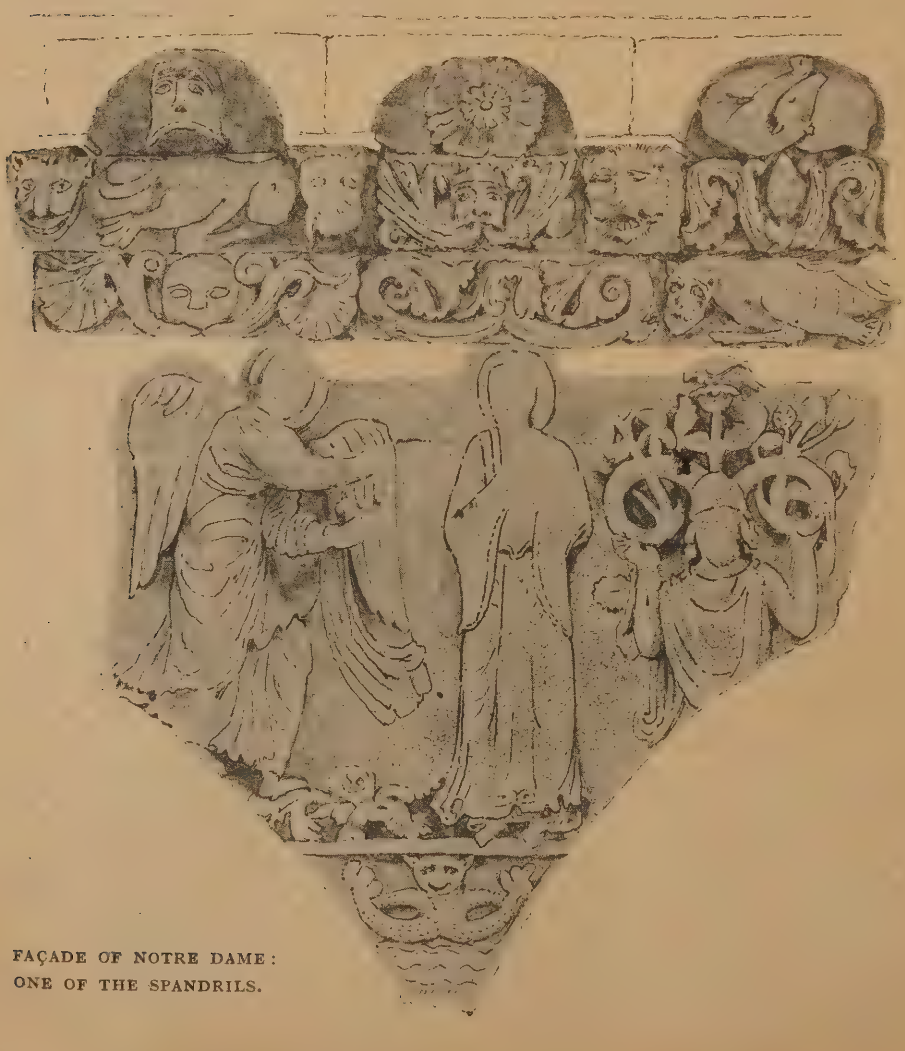
AND wonder we may, too, at such a hardly possible looking piece of antiquity still existing in the midst of modern life, with the untraceable charm in it of the childhood of mankind; of the traditions of Etruria, Rome, and Byzantium, imported by workmen still imbued with them.

That from the south these men must have come, no one can doubt who looks at the building; or that remoteness of locality from central influences of change is, as much as remoteness in time, the reason of its strangeness, as would appear from the date, 1099, given for its foundation.

To many the style of this church is rather a surprise and a puzzle; it is, however, the northernmost of a noteworthy group of sister churches centering in that of Angoulême, the family likeness, as not seldom happens, being, perhaps, more traceable in the disposition than in the appearance.



NOTRE DAME, POITIERS.



FAÇADE OF NOTRE DAME: ONE OF THE SPANDRILS.

* * *

The article from which the above is extracted is one of the most interesting in the current issue of THE ARCHITECTURAL REVIEW. The article is freely illustrated, and there is, in addition, a double-page plate of Notre Dame la Grande, taken from a water colour drawing, given as a supplement to the number. There is also an excellent coloured supplement: "A Spanish Garden," from the original painting by A. T. Griffith. Amongst the other purely architectural features of the number are articles on "The Houses of Parliament," by Paul Waterhouse; "From Holborn to the Strand: An Ideal Street," by Mervyn Macartney; and "Jerusalem from an Architectural Point of View," by T. R. Spence. The whole makes one of the best Art Annuals published this season. The price is ONE SHILLING.

An Architectural Causerie.

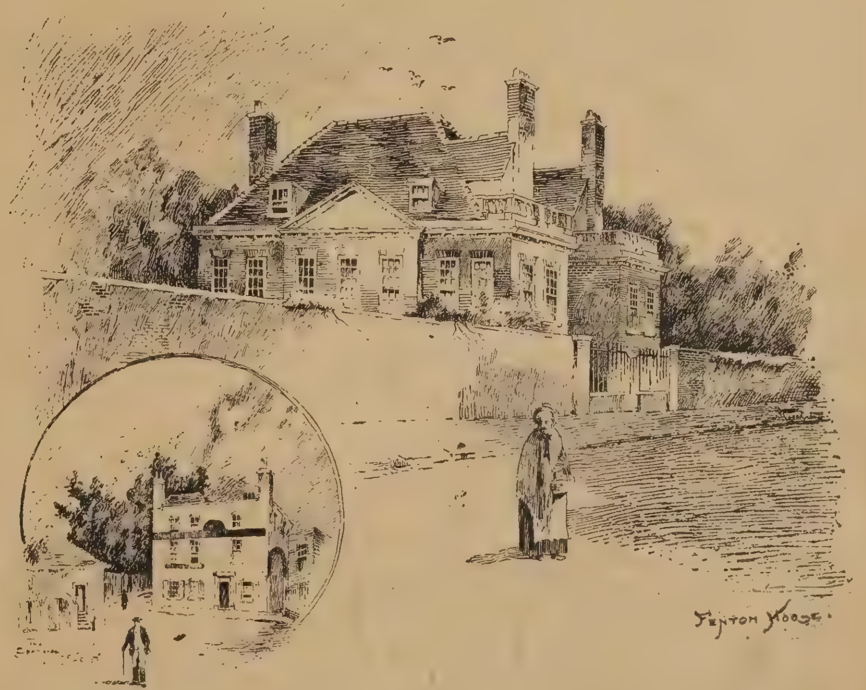
The Art of Turner. IT is a well-worn and unctuous platitude that says in many and varying ways that "genius will out," or "genius cannot hide its light under a bushel." Its frequent repetition from the lips of plagiarists of all ages and without distinction of class, has, doubtless, by no means endeared it to the majority of readers. These plagiarists seem to have secured a vested interest even in some of our few universal truisms, turning them into dry-as-dust formulas. Yet, because this is so, we must not let pass without acknowledgment the truth which underlies them, and there is a truth beneath the ones I have quoted which well deserves examination. Precisely eighty years ago Turner, yet a novice in his art, made his first visit to Italy. This date for me has always marked the beginning of a new régime in the art of our English colourists; for it is from that year onward to his eclipse that Turner produced those dreams of exquisite colouring and extraordinary imaginative power, which are generally acknowledged to be unequalled by any exponent of our art, and, as some would have it, by the exponents of any other art also. It is not this, however, which alone will prove the truth of our platitude, but it is the rise of Turner, almost unaided, from his small beginning and the miniature realm of his first efforts into the wide sphere of universal application.

The main facts of his life are known to everyone. His birth into a plebian, uneducated family; his first satisfaction with the hack-work his genius easily procured for him; and, finally, his soaring ambitions, which urged him onwards to surpass Claude, Wilson, Vandevelde, and even attempt to rival Titian in his colour and draughtsmanship. Endless battle and discussion have waged with varying success upon this phase of his career, but here it would be obviously out of place to pursue it. Yet that he surpassed Wilson and even Claude in his masterpieces, is widely accepted, but the doubt as to Vandevelde has been powerfully expressed, while the arrogance of his competition with the great Venetian master, Titian, has met with a somewhat just outburst of ridicule. The power of Turner's art was purely imaginative; alone it would have served him little, but behind there was an extraordinary conviction of the innate morality of Nature, if I may use such a phrase. He was throughout all his efforts the exponent of the unintelligible morality expressed, as he thought, by Nature in all her moods. This has made him the living force and vitality in art, that has brought to him the intense love, and strong hate, of different personalities; by few, if by any, has he been ignored or regarded with indifference.

It has been noticed of his work, that even by a marked divulgence from the actual lines of a landscape he caught and expressed the prevailing idea or emotion such a landscape usually conjured up. His treatment is the antithesis to that of Millais in his "Chill October," that photographically correct rendering of a bleak moorland scene, where the artist has absolutely failed to convey the predominant idea of the subject. It might almost be said of Turner that he entered into the forces of Nature; her beauties and secrets he claimed as a natural heritage, and these he has given to the world in his wonderful colour poems. Had Coleridge been a painter instead of a poet he would have been a second Turner, with, perhaps, more of human interest—given him by his far higher education. It must be realised that Turner was in no wise a scholar, or even had the advantage of a good education. His acquirements were all the result of the fire within him, which consumed his ignorance until he saw Nature as few men have been privileged to see her. He saw her with the veil fallen from her figure, striving for the ultimate happiness of mankind, and in almost every picture he has immortalised one of her moods. His "Liber" drawings are the most powerful and most successful series any painter has produced. They are a complete work as a critical and appreciative interpretation of Nature. So intimately connected are they that it would be an injustice to separate one from another and judge them apart. These sepia drawings, even without his work upon their reproduction, would alone give him a claim on posterity; yet when we consider the mass of his painting, the extraordinary volume of his work, differing and advancing from day to day, the genius of the man seems almost immeasurable.

For a discussion of the individual excellence of his work, we can go to no more sympathetic critic that Mr. Ruskin, yet it will be seen that even the beautiful language at his disposal sometimes fails to applaud sufficiently those paintings of final excellence. Worthy Thomas Malton, whose only claim to notice is because of his dismissal of Turner as a bad perspective draughtsman, would be somewhat dismayed at his foolish error, did he know the present-day appreciation of Turner; but there is always, in the history of every great man, a Thomas Malton who demonstrates to the world the futility of immature judgment. Much is there in the life of Turner of tragic interest. He had been played a sorry trick by Nature, in making him in spirit the apostle of noble romance and high imaginative art, while in body a small pitiably ignoble figure, only retrieved from the commonplace by the clear cut profile and wild restless eyes. To a man of his sensitive nature this must have been hard to bear, and added to it was his lamentable lack of expression, which a good education would probably have eliminated. Two such things as this may seem small to us when compared with his genius, but his highly-strung and nervous artistic nature doubtless magnified them into insupportable obstacles to fame; and those increasing voluntary withdrawals from his surroundings into solitude were most probably influenced by this. That the ending of such a man drew near unto madness cannot be regarded as strange, for he saw too clearly for ordinary life, too deeply to be unaffected by it; and the weak flesh finally revolted against the supremacy of the spirit. "If you would live happily," says a German sceptic, "see without understanding and hear without knowledge," and this Turner could never do.

F. B.



FENTON HOUSE.

TWO HOUSES AT HAMPSTEAD. DRAWN BY FREDERICK ADCOCK.

Two Hampstead Landmarks. FENTON HOUSE, Hampstead, which is illustrated on this page, is situated in The Grove, a thoroughfare leading to Hampstead Heath. It is known locally as "The Clock House," as in former times there was a clock on the front of the building. This is now replaced by a sundial. The house is a very good example of the Queen Anne's style.

"The Spaniards," Hampstead, stands on the border of the Heath, on the site of a lodge once occupied by the keeper of Caen Wood House. Various reasons are given for the uncommon name of this well-known tavern. It is said by some to have derived its name from having been once inhabited by a wealthy Spanish nobleman, and by others because it was once taken by a Spaniard and converted into a house of amusement. It was the landlord of this inn who stopped the mob during the Gordon riots, by throwing open his cellars and allowing the men to help themselves, thus detaining them until the military arrived. Both illustrations are by Mr. Frederick Adcock.

Open Spaces and Buildings.

THE reaction from crowded courts and narrow lanes, the desire for more light and air, the necessity of relieving traffic, have led to a general rebuilding of modern towns, and the results have been favourable to health and comfort. They do not always, however, make for beauty. The architectural effect of towns depends upon proportion, grouping and fitness. Proportion must be applied not only to the different features of buildings but to the general design of the structure and the space before it, especially in regard to height; this must also be treated with some reference to the height of neighbouring structures. Too great an open space will often neutralise the grandeur of a very fine building; its effect is invariably to dwarf it, and the principle is absolute that buildings and spaces must be proportioned to each other. One exception is permissible to this—in the case of parks or of boulevards of the immense width of those of Brussels, which are practically strips of parks; no relative proportion can exist there. The most thorough-going rearrangement and rebuilding of modern times is that of Paris; the height of houses fronting upon a street was limited under Baron Haussmann to 60ft. and open spaces were made wherever practicable; when laid out as gardens the designs were due to M. Alphand, whose parterres and ivy borders set the fashion to all Europe. As the rebuilding progressed many old buildings were swept away, others were "disengaged" on one side, some were completely isolated. These last often presented a barren and awkward appearance, suggesting the text without the context, for they had never been designed to be seen thus—the truth is that an urban building is a picture, and it must not be taken out of its frame. Another change due to the Haussmann régime was the substitution of smooth asphalte for the uneven roads and pavements of old Paris, a great comfort to men if not to horses, but one that should not have been applied to every place indiscriminately. It was laid down on the historic *Parvis*, the space in front of Notre Dame, and the result is unsatisfactory; every atom of light and shade has disappeared; the walls of the cathedral rise from a smooth, polished area of featureless grey. The place is still further marred by the merciless straight lines of the tramway and the great beauty of the church is lessened by an appearance of being over-restored and over-isolated. Better far the little strip of honest turf and the few trees which partly screen Westminster Abbey and thereby heighten its effect, the grass running right up to the walls and contrasting with them. Of modern open spaces in London other than parks two may be named as failures through want of proportion; one is Hyde Park Corner and the other Cambridge Circus. The complete disregard for architectural effect in the position of the Arch and its consequences are only too well known. Cambridge Circus is absolutely unpardonable, for what should have been the finest *carrefour* in mid-London is essentially mean and confused. Nash, with all his faults, could have done better than this.

J. C. P.

On Reflection.

The Classic Spirit in Architecture.

IT will be remembered that we referred quite recently to the proposal to establish a British school at Rome, and it is in connection with this scheme that the late president of the Royal Institute of British Architects, Professor Aitchison, writes to the "Times" to point out what a loss it is to Architecture that such a school does not exist. He says in one part of his letter: "In spite of the enthusiasm for Roman work in the fifteenth and sixteenth centuries no one was found to explain the Roman method of building till that illustrious engineer, M. Auguste Choisy, published his celebrated 'L'art de batir chez les Romains' in 1872, and we still want to know from whom the Romans took their methods and the real dates of the remaining Roman buildings and ruins at Rome." With this desire to discover more and more of the methods of the old builders who founded such a noble school no one will surely disagree, for such knowledge could not but benefit Architecture. But from Professor Aitchison's views that British students should recognise the importance of measuring the Roman monuments, and, it may be taken, become classicists, a great number will differ, for it must not be forgotten that there is a large section of architects who cry "not backwards with stereotyped models, but forward with an original purpose." Then later the professor says that "as the architecture of Greece is the most perfect the world has seen, the study of this primitive and perfect architecture is as important to architects as the study of their unequalled literature is to poets and scholars." This is admirably expressed and perfectly true, though it needs, perhaps, for some students, to be qualified by a word of warning against a pedantic spirit. The study of ancient examples is worse than useless if it leads only to slavish imitation. The student's aim should be to discover the principles underlying the great work of the past and to adapt those principles with judgment and discrimination to the needs of our own times.

The Dewey Arch.

WHAT a great deal the Chicago Exhibition did for America. Apart from the temporary benefits derived by the tens of thousands who were connected with it, there have been some results effected wide in their influence, strong in impetus and holding out fair prospects for the future. Foreign architects who saw the exhibition were amazed at the quality of the buildings erected, having always considered their American confrères as being rather crude in their ideas and without artistic instinct. It also did much good for the American sculptor. Until a few years ago, the art of sculpture had never been properly appreciated in the country, but, then, the exhibits brought home to the people how great was the work of the sculptor, and the National Sculpture Society has since kept up the interest excited by holding some unique art exhibitions. Their crowning effort has been the Dewey arch, and it is considered by some that when this has been completed in durable material (for it is now a plaster structure), the American School of Sculpture may be said to have become emancipated, its future progress being even more rapid than during the past decade. It is not so very long ago that to American sculpture could be applied that epitaph, so abhorrent to many here, "made in Germany"; but things have now turned round and in future it will be the production of the home artists that will beautify or disfigure the view; and this is only right, for the German sculptures were characterised by that quality possessed by articles that are turned out "in quantity," a quality which, in sculpture of all things, would be especially displeasing. The Dewey Arch is the product of all the chief sculptors of America, who volunteered their services and spent about six weeks on the work. In its main lines the arch is an enlargement of the Arch of Titus, and has eight colossal figures of naval heroes, the whole being surmounted by a group representing Victory; a colonnade is combined with it also. We are glad to note that the twenty-five sculptors who produced it worked together in entire harmony and unison.

Must Machine-made Things be Ugly?

MR. CHAMBERLAIN'S recent speech at the distribution of prizes at the Birmingham School of Art (reported in last week's issue), was, like most of the speeches of that gentleman on non-political subjects, stimulative and thought-provocative to a degree. With most of his criticisms and deductions we heartily agree; but in one instance the right honourable gentleman came very near to an error, and that was when he implied that articles turned out by machinery were almost of necessity inartistic, ugly and vulgar. This need not be so, and in many cases it is not so. Of course, we do not mean to imply that a machine-made article can compete in that indefinable quality with which the personality of the craftsman endues hand work, but we do postulate that given a good original design, there is no real reason why that design should not be reproduced thousands of times by machinery. A design is not necessarily bad because it is common; a brick is not of necessity a bad or an ugly thing because it is used in the majority of buildings, and many hundreds of times in a single house! Such a machine made article, whether it is a door or a skirting-board, while not possessing the advantage of rarity, or of testifying to the owner's riches, may yet possess the qualities of fitness for the work it has to perform and appropriateness to its surroundings, and may be of pleasing design. Whilst in Nature we are told that there are not two leaves exactly alike, we know that oak leaves resemble each other and the leaves of every other oak tree of the same species, so that an oak leaf can never be taken for anything else, and yet oak leaves are never ugly or inartistic, and, though we walked through a whole forest of oaks and saw millions of oak leaves, we should never think them vulgar! In workmen's dwellings, in cheaper suburban houses, we are bound to have many of the fittings and much of the furniture of the same stock pattern, because they are cheap, but they need not be vulgar in a bad sense because they are common. No! Let the manufacturer, the maker of deal doors, of iron stoves, of ware finger-plates, or whatever it is, select a good, effective and artistic design, and then he may turn them out till further orders. One does not expect wrought-iron stoves and hand-painted finger plates in a labourer's cottage or a cheap terrace house; but there is no reason why the stove or the door-furniture should not be designed on sound artistic lines and conform to the canons of good taste. The original design being a good one, serviceable and artistic, the more reproductions of it the better—better that is than a greater variety of bad ones. There is nothing essentially vulgar or demoralising to the artistic instinct in the knowledge that another man has, or a hundred other men have, a door panelled like your own, or a stove made on the same pattern. The only essential point is that the original design be a good one; only the rich can afford the dubious blessing of possessing an article, the counterpart of which does not exist anywhere else in the wide world.

THE "RISING SUN," WYCH STREET, AND HOLYWELL STREET, STRAND. DRAWN BY HANSLIP FLETCHER.

THE STRAND.

By JOHN HEBB, F.R.I.B.A.

> Come Fortescue, sincere, experienced friend,
> Thy briefs, thy deeds, and e'en thy fees suspend;
> Come let us leave the Temple's silent walls,
> Me business to my distant lodging calls;
> Through the long Strand together let us stray,
> With thee conversing I forget the way.
>
> * * * * * *
>
> There Essex' stately pile adorned the shore,
> There Cecil's, Bedford's, Villiers', now no more.
>
> GAY TRIVIA, 475-92.

THESE lines were addressed by Gay in 1716 to his kinsman and schoolfellow William Fortescue, Q.C., M.P., and afterwards Master of the Rolls. Fortescue had chambers in the Inner Temple, having removed there from the Middle Temple in 1714, and Gay's "distant lodging" was in Whitehall, where he had apartments assigned to him by the Earl of Lincoln, a privilege which Gay appears to have lightly esteemed as below his merits; but inasmuch as he never wrote anything which was of service to the court, and was the author of the famous line in the "Beggars' Opera":—

> "That Jimmie Twitcher should 'peach I own does surprise me."

(which everybody applied to Lord Bute), Gay's lodgings in Whitehall and the commissionership of lotteries, with a salary of £150 a year, which he obtained in 1722, appear to us at the present day to have been a not inadequate reward for his not very strenuous labours, Gay never having been a politician.

The Strand must have been from the earliest times an important thoroughfare; it is said to have been first paved in the reign of Henry the Eighth, although, in 1353, John de Bedeford, of London, was appointed commissioner for paving the road and relaying the foot pavement; but it is possible that this commission, like other commissions we have heard of, accomplished nothing.

Up to the time of the Reformation, the Strand was a favourite place of residence of the bishops, who, being protected by their cloth, could afford to live outside the city walls; but in Tudor times, as Spelman says, the bishops' houses were taken from them by courtiers without any recompense, and the stately mansions of the hierarchy on the banks of:—

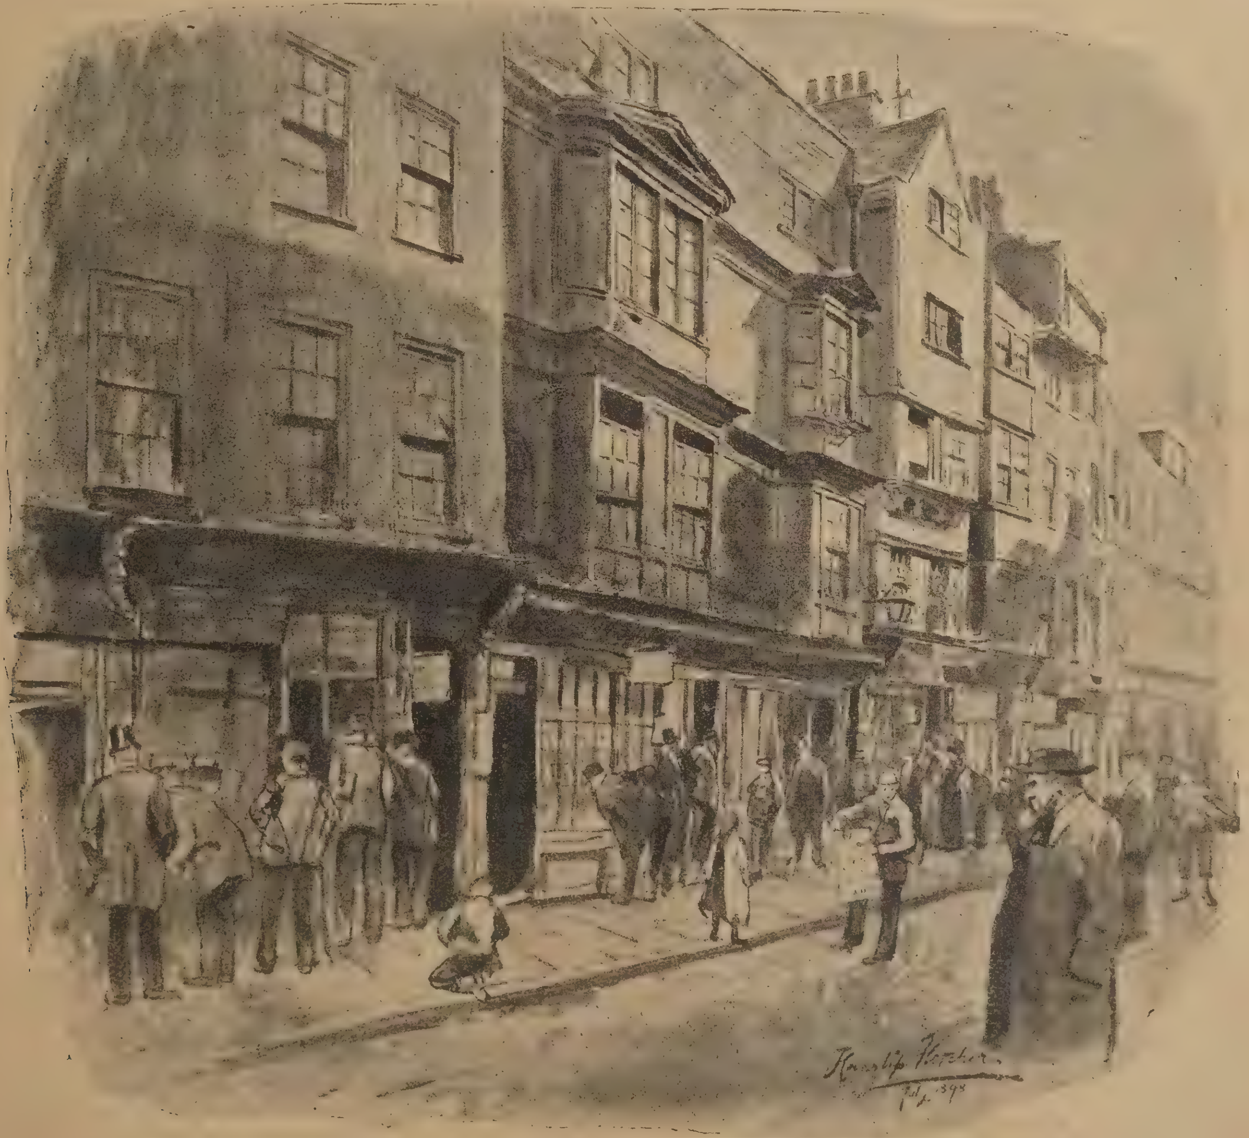
> "The clear Thames, bordered by its gardens green,"

sloping to the river, with their terrace walks and watergates, passed into the hands of the nobility, who, in their turn, alienated their pleasant domains or let them to speculating builders.

The Strand has always been celebrated for its pageants and has witnessed the passing of Queen Elizabeth to St. Paul's to return thanks for the destruction of the Spanish Armada, and of Queen Anne on the occasion of the Victory of Blenheim, the procession of George III. on his recovery, and the funerals of Nelson and Wellington.

Allen, in his history of London, says that there was no continued street here until about 1553 (temp. Mary), so that Elizabeth's progress from Charing Cross to Temple Bar, after the defeat of the Armada, could scarcely have been a very pleasant one. The side next to the Thames consisted at that time of distinct mansions screened from the vulgar eye by cheerless extensions of massive brick walls. The north side was formed by a thin line of detached houses, each of which possessed a garden at the rear; all beyond was country, St. Giles's-in-the-fields being a distant country hamlet.

The building shown in the centre of the small illustration on this page is the Rising Sun public house (No. 37, Wych Street, at the eastern end of Holywell Street), which is of the time of James the First, or probably earlier, and is said to be haunted by a ghost in the shape of a white lady. The large building on the left of the illustration of the Strand, looking westward (*see* p. 305), is Messrs. W. H. Smith and Sons' premises at the corner of Arundel Street, erected by Mr. W. H. Smith, the founder of the



HOLYWELL STREET, STRAND, W.C. DRAWN BY HANSLIP FLETCHER.

business, from the designs of Mr. H. R. Abraham, architect, the brother-in-law of the first Lord Westbury, hard by the site where

> Arundel's famed structure reared its frame,
> The street alone retains an empty name,

the structure (Arundel House) having been pulled down between 1670-80.

The buildings on the right side of the illustration, some of which retain something of their old picturesqueness, will shortly be swept away to make room for the new street from Holborn to the Strand.

The spire seen in the distance is the spire of the Church of St. Mary-le-Strand, built between 1714 to 1723 by Gibbs; it was his first work. The portico, imitated from the Church of Sta. Maria della Pace at Rome, has been much admired, but is not, perhaps, the most successful part of the composition, which is at once refined and dignified. It was originally intended to erect a column 250ft. high, with a statue of Queen Anne on the top, about 80ft. from the west front of the church; but, as the Queen died before the church was completed, this project was happily abandoned. Some illustrations of old Wych Street were given in No. CCXLVII. of the BUILDERS' JOURNAL.

"St. Clement's Church," says Leigh Hunt (see "The Town," page 146), "was rebuilt towards the end of the century before last by Edward Pierce, under the direction of Sir Christopher Wren, but it is a very incongruous, ungainly edifice. Its best aspect is at night time in winter, when the deformities of its body are not seen and the pale steeple rises with a sort of ghostliness of grandeur through the cloudy atmosphere." The Strand near the Outer Temple was much affected, in the last century, by persons connected with the theatre. Congreve lived in Surrey Street, Mountford the player (killed by Lord Mohun) in Norfolk Street, Mrs. Bracegirdle, "the brown," in Howard Street, and Mrs. Barry somewhere near her.

REGISTRATION OF ARCHITECTS.*

By ELLIS MARSLAND.

IN introducing this question I must necessarily go over some ground with which you must all be familiar and define what we mean by registration. *In the present* it means that every man practising architecture will be duly enrolled in an official register under an Act of Parliament and be duly responsible for his professional actions, and that no one be allowed to practice until he is duly enrolled. *In the future* it means that no one will be allowed to practice architecture until he is duly qualified and has been found so by undergoing a qualifying examination. It means, in fact, little more than making the Institute examination compulsory by Act of Parliament. It is a matter for surprise that this obvious benefit should not have been secured to the profession long ago, seeing the advantage it has been to the learned professions of law and medicine.

It is not my intention now to say one word by way of recrimination against the Institute, but I would just like to point out how far it has gone in the direction of registration. On May 30th, 1890, it passed the following resolution:—"That while not opposed to the principle of compulsory examinations as applied to those about to practice architecture, the Institute is of opinion that the difficulty of restricting by statutory powers the practice of architecture to those who have passed an examination is at present so insuperable that it is undesirable to make an immediate application for such powers." To what does this resolution amount but the admission that the principle is a good one and that the difficulties in the way are the only bar to progress. Why do we band ourselves into societies and associations unless it be for the express purpose of overcoming difficulties and bringing about reforms for the general good? This inactivity is placing the Institute in a false position and is causing a vast amount of dissatisfaction, especially among provincial members, as the want of such a measure of reform is felt far more keenly by them than by us. Of what use is it for the Institute to say that their examination is a panacea for the existing evils, unless this examination is made compulsory? Until men find that by undergoing a course of study and passing an examination they are placed in a better position in the eyes of the public than the man who possesses no qualifications at all, it is very unlikely that an appreciable number of men will voluntarily come forward and avail themselves of this means of entering the profession.

Now the position of the practice of architecture in this country at the present time is this—Any person with or without a fair general education, any builder, builder's foreman, clerk of works, clerk in a Local Board office, auctioneer, undertaker, &c., with the sole qualification of being able to provide a brass plate, is at liberty to advertise himself as a person qualified to give advise to the public in the science and art of architecture. Builders, decorating firms, and others going out of their proper province, boldly proffer their services as architects to their customers gratis, and the apparent saving of 5 per cent. is not to be resisted; while it is well known to those behind the scenes that an architect or architectural assistant is deviling in the background and his services are kept out of sight; but the customer has to pay all the same. Can it be a matter for wonder that architects are still unrecognised while such a condition of things exists, for at present the public have no guarantee that the class who call themselves architects are any better qualified to plan and design their buildings than the contractors who erect them, and should they employ an architect they have no means of ascertaining that his knowledge is greater than that of the builder, and the only certainty about it from their point of view is they will have to pay the professional charges.

But what the Institute have omitted to do the general body of practitioners are endeavouring to do for themselves. On April 6th, 1886, a meeting of architects was held in the Freemasons' Tavern in London, attended by members of the Institute, Society of Architects, and by practitioners not connected with any society, and a committee was then formed called "The Architects' Registration Committee" to give effect to the following resolution then and there passed:—"That it is the opinion of this meeting that instructions be given to the committee to consider the means necessary to obtain an Act of Parliament making it compulsory for all architects to hold a Government diploma." This committee was composed of Institute members, members of this Society and independent members, who set to work and eventually framed the Bill at present before Parliament. There is an erroneous opinion abroad that this is the Society of Architects' Bill, and I wish to correct this impression. That the Bill receives its cordial sympathy and support is no secret, but it is not the Bill of this Society, and never has been, and the Society reserves to itself the right to be heard in committee when this stage is reached with a view to certain amendments.

To put the matter shortly, the advantages arising from registration are these:—(1) Closing the doors to incompetent men; (2) raising the standard of the profession; (3) obtaining the confidence of the public and State recognition.

It is not proposed for one moment to say all who desire to build should employ an architect, but what we do propose is that henceforth in the interests of the public no person shall be entitled to call himself an architect whose name is not enrolled as qualified under an Act of Parliament, and any person wishing to employ an architect may, by consulting the official register, ascertain what men are qualified.

I will now deal with the objections. Objection has been urged against the movement that it will create a monopoly and thus be opposed to the principles of modern legislation, but there cannot be a monopoly created where it is made possible for anyone who proves himself qualified to share the rights. Another objection is that it will be necessary at the outset to register some of the very men who have caused all the mischief. This is very true, and unless this is done it will be found that Parliament will not listen to you. That you must respect vested interests is an axiom of Parliamentary practice, and when a man can show that he has practised architecture Parliament will say that you must not deprive him of his rights, and the obstinate attempt to exclude this principle from the Medical Act was the chief cause of delaying its passage through Parliament for thirty years. Another conscientious objector is the artist architect, and I should like to introduce you to this gentleman. Outwardly he is an individual with long hair and a red tie, who has a dreamy far-away look, which rude people call vacancy, and drivels about his beloved art and its soul inspiring influence; he cannot demean himself to consider such questions as rights of light or party walls, all of which he considers do not come within his province and are relegated to the mere surveyor. His specifications are left to the quantity man, his construction to the builder, or clerk of works, his sanitary work to the plumber, and his lack of acquaintance with the building by-laws is painfully brought home to him when he discovers his pretty pictures cannot be realised; his time is spent in his office making drawings impossible of execution, or else in designing sprawly wall papers or uncomfortable furniture. This is the gentleman who tells you the art of architecture requires none of your registration, that you are only lowering its dignity by making it a profession.

But, gentlemen, I maintain that at the present time architecture is trailed in the dust at the heels of many men who are unworthy of the title of architect, and by a scheme of education and registration we shall raise it above its present unsatisfactory surroundings to such a height as will at least bring it to the level of the learned professions, and after this has been attained then develop and foster the artistic side as much as you will and the more the better.

That you cannot examine a man as to his artistic attainments, is partly true. But a painter is no less a painter because he has been instructed in the science of perspective, or in the proper manipulation of his colours and their chemical composition. Or a sculptor is none the worse for a complete course of study of the anatomy of the human figure. We do not, of course, claim that architects can be manufactured from study and examination, but what we do claim is that there is a constructional, hygienic and scientific side to this question, which is of quite as much importance as the artistic, but which, unlike the arts of painting and sculpture, affects the comfort, health and well-being of the community; and this being the case the men who take upon themselves the responsibility should prove themselves competent. When we dislike a picture it can be relegated to the garret or given away to our friends; when a piece of sculpture displeases us a few blows with the hammer and it is made useful for the garden path. But it is a much more serious matter with our dwelling-houses if, when erected, whatever their architectural merit may be, they are found unfit, by reason of faulty construction or the wrongful disposition of the rooms or fireplaces, or on account of the sanitary arrangements being unsound and the ventilation bad.

The question of architectural taste is always a changing quantity and what may be one man's meat may be another's poison in this respect, so that it is not pretended that it is desirable to examine on the artistic side of architecture, even if you could find artistic examiners who would be agreed on any one point. The first effect of a Registration Act would be to put a stop to any further increase in the number of incompetent practitioners, and thenceforth they would become a diminishing quantity.

---

* A paper read before the Society of Architects on December 14th, 1899.

ARCHITECTURAL ASSOCIATION.

THE STREETS AND BUILDINGS OF OLD LONDON.

A MEETING of the Architectural Association was held at the rooms in Conduit Street on Friday evening last, Mr. G. H. Fellowes Prynne being in the chair. After the minutes of the last meeting had been read and confirmed, Messrs. H. B Smith and J. S. Blunt were elected members of the Association. A list of nominations was then read, after which Mr. Andrew Oliver read his paper on "The Old Streets and Buildings of London" as follows, first describing a number of slides illustrating his lecture :—

HOLYWELL STREET, STRAND, W.C. DRAWN BY HANSLIP FLETCHER.

In attempting to give in a short paper an account of some of the streets and buildings of Old London one is perplexed at the outset not so much as to what should be retained, but what should be omitted. There are so many ways of dealing with the subject - so many ways of looking at it. The streets of London, full of interest and of information as they are, would be entirely lacking these qualities were it not for the histories which have gathered round the buildings which London formerly possessed. The history of a city is built up by its buildings and the inhabitants who have occupied them; but it is chiefly in the edifices of the past that we are enabled to discover the monumental history of its past. We have a few scanty remains of the Roman period, and a few of the ruined and desolated monasteries and of the early churches, which were to be found here, and we can also, in the names of its streets, trace the gradual changes which certain neighbourhoods have undergone, and even the few remains we have of a past period are getting less and less every year, until at length the only records that will be accessible will be found amongst the drawings of the antiquary and the pages of the historian. One has to read the work of John Stow to realise what we have lost in the way of ancient architecture; but few buildings given by him are now in existence. The destruction of these historical documents has been so complete that when one reads the account of London in the days of Henry VIII. it seems like a fairy tale.

Walls and Gates.

The oldest remains we have in the City are portions of the old wall by which it was encircled from very early times. The course taken by the wall is as follows :—Starting from the Tower, it went up to Aldgate and on to Bishopsgate, skirting Hounsditch, then to the churchyard of St. Giles', Cripplegate, where there is to be seen the remains of an old postern to Aldersgate. It then took a sudden turn until it came to Newgate, when it made its way straight down to the river, ending at what was afterwards Baynard's Castle, or near there. Baynard's Castle was known as the Castle of London, and the Governor was styled Constable of the Castle of London to distinguish him from the Constable of the Tower. It is possible that it went along by the river, but few, if any, remains have been found. Inserted in the south wall of St. Swithin's Church, Cannon Street, is a piece of the old London stone. From this point the Roman roads were measured.

In looking through the City records, there are several items of interest in connection with the old gates. The great gates were closed at the beginning of the curfew at St. Martin's-le-Grand (and the wickets were to be opened at the last stroke) and not opened that night unless ordered by the mayor or alderman. Edward II. ordered, after the bell had been rung at St. Thomas Acons, the wickets were to be opened (about six a.m.), and the great gates at sunrise. A guard was also kept at each gate, consisting of eight to twelve men, under the alderman of the ward. Tolls were levied on all carts having goods to be sold entering or leaving the City, except in the case of private individuals or goods for household use. The gate porters were not to allow lepers to enter the City. The gates and tourelles were let on lease to various persons. Geoffrey Chaucer held Aldgate in 1374. The Bishop of London always provided the hinges of Bishopsgate, taking as toll one stick from every load brought in. William Kingscote, keeper of Ludgate, was suspended for throwing stones from the top of the tower so that neither the sheriffs nor their officers could enter.

Monastic Buildings.

Amongst the buildings of Old London none were of more importance than the great monastic establishments. Sir W. Besant says:—"Within and without the City walls there stood fifteen great monasteries whose splendour only can be understood by the ruins of Tintern, Glastonbury, Fountains, and Rievaulx." Their reign came to an end at their suppression in the time of Henry VIII. and Edward VI. They may be arranged under the heads of monastic and conventual buildings, colleges, hospitals. The buildings which still possess some remains of an early period are as follows:—St. Bartholomew, Smithfield, the Charterhouse, the Temple, Austin Friars, St. Helen's, Bishopsgate; St. Mary Overie, the Greyfriars (now Christ Hospital, gateway, St. John's, Clerkenwell). Those destroyed consist of the following:—St. Martin's-le-Grand (now the Post Office); the Hospital of St. Mary of Bethlehem (now occupied by Liverpool Street Station); Priory and Hospital of St. Mary; The Preceptory of the Knights Templars, Holborn; The Minorites, or Nuns of St. Clare (now the Minories); Crutched Friars, St. Katharine's Hospital; site now occupied by St. Katharine Docks; the tombs and fittings moved to St. Catherine's Hospital, Regent's Park; The Abbey of St. Mary of Grace, or Eastminster, now the site of the Mint; The Priory of Holy Trinity, Aldgate; the two houses of the Black Friars, one formerly on the site of Old Square, Lincoln's Inn, the other at Blackfriars, now the "Times" office. The Monastery of the White Friars adjoins the Temple.

Colleges.

St. Nicholas Brotherhood, Camomile Street; St. Thomas of Acons, on the site of the Chapel of the Mercers' Company, the birthplace of Thomas à Becket; Whittington's College, Paternoster Royal; Jesus Commons, near Dowgate; St. James's Chapel-on-the-Wall, Cripplegate; Holme's College and Lancaster College, both attached to St. Paul's; Leadenhall College, in the Chapel of Leadenhall; Pountney College, St. Laurence Pountney; St. Michael College, St. Michael, Crooked Lane. The College of St. Mary Magdalene and All Saints, Guildhall.

Hospitals.

St. Bartholomew, Smithfield; St. Thomas, founded in Southwark, 1313, near to St. Mary Overies, purchased at the suppression by the City; St. Giles, Cripplegate; The Lazar House, Southwark; St. Anthony, Threadneedle Street.

St. Paul's Cathedral.

Old St. Paul's was surrounded by a wall which possessed six gates. They were the Littlegate, Cheapside, St. Augustine, Paul's Alley, Canon Alley and Paul's Chain, so called from the great chain which was drawn across. The road went along what is now Carter Lane, where stood the brewery and the bakery. It then went up Creed Lane, and so to Paternoster Row. The "Jesus Tower" was near to St. Augustine's Church, at the east end. St. Paul's was about 690ft. in length by 130ft. at its greatest width. It possessed the unusual feature of a north and south cloister. Remains of the latter, and also of the Chapter House, are to be seen on the south side. The Pardon Church-haugh, built by Gilbert à Becket, stood on the north, where also stood the Charnel House, which was taken down by the Lord Protector Somerset. At the west end there was a Galilee porch and the Church of St. Gabriel, and in the crypt, at the east end, a church dedicated to St. Faith.

Churches.

These may be grouped under two heads—those churches which were erected before the great fire, and those subsequently. Of the first division we have left—All Hallows, Barking; St. Andrew, Undershaft; St. Bartholomew, Smithfield; St. Ethelburga, Bishopsgate; St. Giles, Cripplegate; St. Helen's, Bishopsgate; St. Katherine, Cree; St. Olave, Hart Street. There were three others before the fire, and not destroyed then, but they have been pulled down in later times—All Hallows, Staining; St. James, Duke's Place, Aldgate; St. Martin, Outwiche. As regards the second division, they may be classified as those which were built by Sir Christopher Wren and those which have been erected by others.

In the Harley MSS. 4,941 British Museum will be found three schemes for the rebuilding of the destroyed churches. The original number proposed was thirty-nine, and the document, which authorises this number, is signed by the Primate, at the time "Gilb Cantuar." In all there were sixty-two rebuilt, namely, fifty under the supervision of Wren and the remainder by other architects. The loss by the Fire may be briefly stated:—Churches not rebuilt, thirty-five; rebuilt by Wren and others, sixty-two; total, ninety-seven. It is much to be regretted that so many of these monuments of the past have been destroyed, and that the destruction is going on. Only on December 6th of the present year were the fittings of St. Michael Bassishaw sold preparatory to the destruction of the church, and in the "City Press" of December 13th the possible destruction of St. Ethelburga, Bishopsgate, is mentioned.

Two churches have been re-erected. St. Mildred, Poultry, is now the private chapel at Thorpe Hall, South Lincolnshire, and St. Bartholomew-the-Exchange, it is said, is about to be removed from Moor Lane, Finsbury, and rebuilt elsewhere.

Cheapside.

In looking through the old chronicles, we find a different state of affairs to what is in vogue at the present day. For instance, we read that in Cheapside in the year 1273 seventeen candlemakers were expelled by the irate citizens. Bonfires of false goods took place occasionally. In 1311, at the request of the hatters, search was made for bad and cheating hats, with the result that forty grey hats and fifteen black hats were publicly burnt. In 1340 the furriers and fishmongers had a riot, and a fishmonger tried to cut off the Lord Mayor's head, and he was nearly hung for it. The pillory was also set up, and a fishmonger was put in there for selling bad fish, "And the said fish was burnt under his rascally nose." Opposite Wood Street stood Cheapside Cross, erected by Edward III. and pulled down by the Commonwealth in 1643. Bow Church, rebuilt after the Great Fire, has still in existence its Early Norman arched crypt from which it is said to take its name, "St. Maria in Arcubus."

The Royal Exchange.

The present is the third building which has been erected. The first was commenced in the year 1566 and opened by Queen Elizabeth in 1570. It was, however, a great nuisance. We find in 1590 certain women were prosecuted for selling oranges and amusing themselves and cursing and swearing at every one. Two years later, a tavern-keeper was fined for allowing tippling and for broiling herrings, sprats, and bacon to the vexation of the worshipful merchants. In 1622 complaint was made of the rat-catchers and dog-sellers, and bearwards would parade before the Exchange with a monkey on the bear's back. Gresham's Exchange was burnt in the Fire, and a new one was erected by Sir Christopher Wren. In the building of London it was Wren's idea to make it the central point of the City, from which broad avenues proceeded, but unfortunately it was never carried out. This Exchange was burnt down in 1838. The present one was opened in 1842. The Church of St. Peter, Benetfink, was pulled down when the present Exchange was built.

The Bank.

If one were asked what portion of the City has been most altered, the answer would probably be that by the Bank of England and the Mansion House, in the heart of the City. There is not a place more changed, or which has been more altered, than this. The Bank of England, for the most part, stands upon the site of the house of St. John Houblon, who sold his property to the Bank for a site. It consisted of a house with a frontage of about 80ft., running back about 250ft., and a garden. In front there were two small shops or stables. At that period Princes Street, as we now know it, had no existence, there being but a main court, 20ft. wide, which came out opposite to the church of St. Margaret's, Lothbury. Next to the Bank, as first built, there were two churches and a vast network of houses. Close to the Bank stood the site of the Hospital of St. Anthony.

This was a cell to the House of St. Anthony of Vienne. Pigs were given over to the hospital as alms. In 1311 we read that the Renter of the House of St. Anthony was sworn that henceforth he would claim no swine found wandering about the streets of the city as being alms, and that he would put no bells on them, or on those of any other person, nor would allow any such bells to be put on other than those which should be given. The saying at that time was "As fat as St. Anthony's pigs." Three swine killers were appointed to kill all pigs found in the streets: they could be redeemed at 4d. each. If not claimed, they were forfeited, and sold to repair the gates.

The Stocks Market.

Stow says: "In the year 1282 Henry Wallis, mayor, caused divers houses in the Citie to be builded towards the maintenance of London Bridge, namely, in one void place near unto the parish church, called Wool Church, where some time had stood a paire of stocks. The building took name of Moore Stocks, and was appointed by him to be a market place for fish and flesh in the midst of the City. In the year 1322 certain markets were appointed. The stocks were let to farm at £46 13s. yearly rental. In the year 1507 the rental was £56 19s., and in the year 1543, John Cates being mayor, there were eighteen stalls for fishmongers, rented yearly £4 13s. The butchers had also eighteen stalls, rental of £41 16s. 4d., and chambers above rented at £5 13s. 4d." The present Mansion House was erected on the site of the Stocks Market. Pennant tells us that "in the market stood a statue of Charles II., given by his most loyal subject, Sir Robert Viner, Lord Mayor, which his lordship discovered made at Leghorn. The statue represented John Sobieski trampling on a Turk. The Polish monarch was christened Charles, and the turbaned Turk Oliver Cromwell." Horace Walpole says it was unfinished, and a new head was added. The statue remained some time amongst the rubbish of the destroyed market and was given to Mr. Robert Vyner, a descendent of the Lord Mayor. On the demolition of the Stocks Market, it was decided by the City to arch over that portion of Farringdon ditch which lies between Fleet Street and Holborn. It was opened in 1737. Fleet Market lasted until 1829, when it was taken down to form Farringdon Street, and Farringdon Market took its place, being opened in the year 1826. The west side of the market was taken down when the Viaduct was constructed, about 1869.

The Guildhall.

The first Guildhall was built in the year 1411 by Thomas Knoles, then Mayor. In the first year of Henry IV. the executors of Sir Richard

Whittington gave £20 towards the paving, and in the next £20 more. In every window were placed the arms of Whittington. Sir John Shaa kept the first feast there about 1501.

The Guildhall Chapel.

This building was in existence until 1822. It was founded in 1299, with an establishment of warden, seven priests, three clerks, and four choristers. The chapel was given to the City by Edward IV. at the dissolution of the college. The following account of the chapel is taken from Stow:—"The chapel or colledge of our Lady Mary Magdalen and All Saints by the Guildhall, called London College; the same was built about the year 1299, and that Peter Fanelove, Adam Francis, and Henry Frowyck, Citizens, gave one Messuage with Appurtenances In the Parish of St. Foster to William Brampton, custos of the Chantry by them founded in the said Chappell, and . . . the other house in the parish of St. Giles, Cripplegate, in the 27th of Edward III., was given to them. Richard II. granted license to Stephen Spilman to give one messuage, three shops with the appurtenances in the parish of St. Andrew, Holborn. King Henry VI., in the 8th of his reign, gave license to the Custos to build of new the said Chappell or Colledge of Guildhall, and in the 27th year of his reign granted to the parish clerks in London a Guild of St. Nicholas for two chaplaincies.

"The value of the Colledge was £12 8s. 9d. The library, which was situated on the south side, was built by the executors of Sir Richard Whittington and William Bury. The arms of the former were on one side, and the initials WB on the other. The books which belonged to the library were plundered by the Protector Somerset."

THE STRAND, DRAWN BY HANSLIP FLETCHER.

Blackwell Hall.

Next to Guildhall Chapel stood Blackwell, Bakewell, or Bassinghall. In 1396-7 Richard II., in consideration of the sum of £50, granted licence to John Froxle, William Parker and Stephen Spilman, citizens and mercers, that they might assign unto the mayor and commonality for ever for the common benefit the said messuage, called Bakewell Hall, &c. From this period it became established as a weekly market-place for woollen cloths, both broad and narrow, which were brought from all parts of the kingdom to be sold. An ordinance was passed in 1397-8 under the mayoralty of Richard Whittington, and another in the year following, under the mayoralty of Drew Barringtine, declaring that no foreigner or stranger should sell any woollen cloth but in the Bakewell Hall, upon the penalty of the forfeiture thereof. This was confirmed again in 1517. No manner of person being freeman of the City should suffer any person whatever, be he free or foreign, to buy or sell any manner of woollen cloth harboured or lodged contrary to the said ordinance, or any other manner of cloth made of wool within his shop unless the said cloth was first brought to Blackwell Hall. Having stood for about 400 years, it became ruinous about the middle of the sixteenth century; and it was pulled down and a new building erected in the year 1558, at a cost of £2,000.

Blackwell Hall appears to have been erected about 1672. The attic was ornamented with cornice and pediment, a stone gateway being in the centre, the Royal Arms being over, and the City Arms impaling Christ's Hospital on the head of the arch. This structure was taken down in 1819.

DISCUSSION.

Mr. A. W. Hennings said he especially appreciated Mr. Oliver's address when he remembered how very difficult it was to collect information about old London. There was such a wealth of material if it were only looked for. Ely Place might be taken as an example, for there many things of interest had been discovered in connection with the foundations, including an old footbridge, which had simply been covered over, no care whatever being taken to preserve it; such a relic ought to have been placed in a museum. He remembered also that about twenty years ago an old crypt was discovered below a Norman arch at Cripplegate, but just because some little delay would have been caused if measures had been taken to preserve it the place was demolished. An old arch had been knocked down in Cornhill, and the same thing had occurred in Queen Victoria Street, where the ancient monastery of Blackfriars formerly stood. Ground rents were, indeed, high, but every effort should be made to prevent reckless demolition. He would recommend those who had a desire for the study of old work to devote some attention to the study of old London.

In Mr. F. G. F. Hooper's opinion the more the old was studied the more interesting the London of the present day became, for, by pursuing this course, one learned what was the origin and meaning of familiar names and understood the relative positions of the old and the new buildings of the city.

Two books which those interested in the subject might read with advantage, said Mr. C. H. Brodie, were "London City Churches" and "London Riverside Churches." In considering the facts, Mr. C. J. Williams had come to the conclusion that London three hundred years ago was a very much more beautiful place than it was to-day. There was, for example, the style of architecture of Cornhill in the time of Henry the Eighth or the old Cathedral of St. Paul, or the splendid width of Cheapside compared with the present width. We had, of course, vastly improved in sanitary matters, but still he half wished he was living in the old city.

Mr. M. Garbutt entirely disagreed with the adverse comment on the beauties of London at the present time; as regards picturesqueness, the balance was largely in our favour. He referred to the softness of outline which the haze gave, and said that we possessed a city that would furnish us with as much in the matter of picturesqueness as any other city in the world. The details of many of our buildings would not stand criticism, but the beautiful effects which the fog produced could not be overestimated. Citing Cheapside as a wide street was citing an exception, for the majority of the streets in old London were narrow, and he thought that wide streets were a great deal more dignified than narrow ones. With all the fog, London was a better city to-day than it was three hundred years ago. Mr. M. J. Dawson also referred to the beauty of the old city with all its mediæval architecture. The President said they were especially in need of a map like that shown them that evening, one which had all the old parts and buildings distinctly marked out and defined. If any excuse were wanted for the reading of such a paper as they had heard it was that some of the ancient buildings of London were constantly disappearing, and they had seen how small valuable bits of architecture were simply from wantonness destroyed. One lesson we might learn was that if work came into our hands the temptation, which might be great, to destroy it should be combatted and the relic preserved. He could not help feeling that the ground we trod was sacred; the pavement was made up of churches, and it was remarkable to think of the number of these edifices which had been erected in the old days to the glory of God, and to think of the money that had been spent on them. He also felt that in London was written the history of the land, not perhaps in architecture, but still in relation to practically all else, and although the old builders had not the regulations and restrictions (whether good or bad) which were imposed at the present time, the city was more artistic. He referred to the difficulty experienced now to enter into the truly artistic spirit, but quite agreed that we were much better off in the matter of sanitation. He also thought that fog lent charm to the view. Ugly buildings might look pleasing in a misty atmosphere, and even the Tower Bridge might appear pleasing in a fog. He deplored that a site so fine as the Victoria Embankment had been marred by the erection of such a building as the Savoy Hotel, and it seemed a disgrace that such a thing should ever have been allowed. Foreigners were always remarking on the charming effects produced by our misty atmosphere. As regards what the Institute were doing in relation to old London, he said that some time ago a list of buildings had been compiled for the use of members, particularly of provincial members. It was now being essayed to remodel that list, and he thought they should ask Mr. Andrew Oliver to join the sub-committee. They hoped eventually to draw up a kind of pamphlet containing all that was interesting in both the old and the new buildings.

In replying to the vote of thanks that had been proposed and seconded, Mr. Oliver said that the old buildings were disappearing one by one, and it was like the story of the doctor who was to receive a guinea for each of his visits to a patient. In the end, when he was to be paid, he said "Well, singly they're contemptible, but altogether they're irresistible." But he was afraid that as long as it was a matter of sentiment versus rent the victory would lie with the rent.

Arranged on frames around the room was an imposing collection of plans and engravings of buildings and streets in the London of yore.

ARCHITECTURE AND NATIONAL CHARACTER.

At the outset of his lecture on the reflex of the national character in the architecture of the period, delivered on Monday in last week at the London Institution, Mr. Francis Bond pointed out how the fine arts—or what one might call the useless arts—differed from architecture in that while the former did not evolve during the barbaric or uncivilised age, the latter knew no such bounds, and truly reflected the spirit and character of those who formed it. Starting with the Greeks, about 700 years before the birth of Christ, it might be said that their buildings reached, not relative, but absolute perfection, the two most remarkable features about them being their beautiful proportion and the subtlety of the curves employed. Then there were all those corrections in the architecture of the faults of the eye; for instance, the architraves were not perfectly straight (though to the eye they appeared so), but curved upwards or arched slightly, this being done to correct that optical defect which causes a long straight line to appear sagged a little in the middle. Further, the vertical lines of a Greek building were not actually and truly so; they only appeared vertical. All this showed what wonderful care and thought had been expended on every part of the building, even down to the smallest details, while the accuracy of the masonry was astounding. Yet the work had been done entirely by slaves, of whom we had no record whatever, for, unlike the Egyptians, the Greeks did not include any representations on the stones of their buildings of the lives of those who had been engaged in erecting them. But was there nothing in Greek architecture which showed some lack of perception? There was—the utilisation, for example, of a given area. In the Parthenon, after deducting the space taken up by the outer and inner columns, it was found that more than half the nominal area was wasted, and the accommodation in a Greek building as compared with one of the Byzantine style was small. Then the roofs were made of wood, and there was the much disputed question as to how the Greek temples were lighted, seeing that they had practically no windows. Greek architecture reflected the keen artistic temperament, the cultured taste, and the refinement of the nation; but it also reflected the weaknesses.

Coming to the Roman period, we saw a great change. The Romans, unlike the Greeks, built for all time and the characteristic features of their buildings were dignity, unparalleled solidity and utility; they learnt their art on the battlefield and on the march. Byzantine architecture, which followed, was in reality Roman, though its details were Hellenic, and in it we saw the development of the dome, so splendidly presented at the church of Santa Sophia, at Constantinople, which city was then at its zenith and the centre of attraction for European culture and civilisation. St. Mark's, Venice, was the living embodiment of the eleventh century in the East. Byzantine architecture had received much harsh criticism, but it had great beauties, and it was owing to the Byzantine spirit that the hordes of Europe were kept in check.

With the collapse of the great Roman empire, building practically ceased and remained in this state for a long period; then, after the Romanesque style, came, in the eleventh and twelfth centuries, what was perhaps the greatest time for architecture in the world's history—the Gothic. Throughout the length and breadth of Europe buildings sprang up in the new style, and in England, with the development of the monastic spirit, there arose the abbeys and the cathedrals of the various orders. For nearly two and a half centuries after the Norman Conquest our buildings were in the main French, and even as late as 1245, during the reign of Henry III., French influence was very strong in the country. Until the middle of the thirteenth century English architecture was much indebted to France, but then the break occurred, when the language was changed and the English nation really began to run its own course. To christianise the world was the Gothic aim, while the Renaissance's ideal was a return to pagan times. The architecture of the Renaissance reflected the spirit of its age more than any other, but the centuries that followed it, the seventeenth and eighteenth, were dull and unenlightened; the eighteenth was the age of pews.

Then coming to the present age, Mr. Bond asked, what could be said of its architecture? In reality, we had no architecture of our own, no national style, and the buildings of the time reflected the character of all ages except their own. Modern architects knew too much. What could be thought for instance of the London clubs? They did not reflect the spirit of the nineteenth century; some were really sixteenth century buildings at Florence or Rome. The Houses of Parliament symbolised the age of Queen Elizabeth, but were strangers to that of Queen Victoria. Mr. Jackson lived in the time of James the First; and so the catalogue might be extended. Did the suburbs of Brixton and Clapham reflect the national character in the design of their buildings? The inevitable conclusion in regard to our own time was that the spirit and character of the age was not reflected in the works of the architect at all, but in those of the engineer. He was the mirror of the nineteenth century.

"Graphic Calculations" was the subject of a recent lecture delivered by Mr. D. Bennett Dobson before a meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society. It was divided into eight sections: reactions, moment of resistance, shearing stress, graphic arithmetic, wood beams, cast-iron beams, rolled-iron beams, and steel beams.

Crystal Palace Band Stand Competition.—Although no design received has realised the object which the directors had in view when initiating this competition, they have, nevertheless, acting on the advice of the president and their assessor, decided to award the premiums offered. It is not likely that any of the designs received will be executed. The premiums have been awarded as follows: First premium (thirty guineas), Messrs. Walter McFarlane and Co., Glasgow; second premium (fifteen guineas), Mr. Henry C. Eyres, Millfield Cottage, Millfield Lane, Highgate; third premium (seven guineas), Mr. G. M. Ellwood, 55, Alexandra Road, Upper Holloway.

R.I.B.A.

THE ARCHITECT IN RELATION TO FIRE PREVENTION.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, when the president, Mr. William Emerson, occupied the chair. Mr. Alexander Graham regretted to announce the decease of Mr. Stephen William Williams, F.S.A., F.S.I., of Rhyader, Radnorshire, who was elected a Fellow in 1886. Some nominations were read by the secretary, and Mr. Thomas Blashill, F.R.I.B.A., late superintending architect to the London County Council, then read his paper on "The Architect in Relation to Fire Prevention," of which the following is a summary:—

Fire-resisting construction has been made prominent by the Institute from time to time, but it is difficult to keep pace with increasing needs. Buildings are more lofty, and more crowded, and more closely packed with inflammable goods. Old residential buildings are turned into warehouses, the construction being actually altered for the worse. The Cripplegate fire was a case in point. Were it not for an efficient Fire Brigade, we should recognise that fire risks are increasing in spite of Building Acts. There is no law to prevent this or to require efficient protection of persons and property, and the architect must in many ways go beyond legal requirements. It is he who knows the risks and the proper remedies, and he cannot escape responsibility. The public is absolutely reckless of danger until some fatality occurs; then it looks out for a scapegoat. Four provincial theatres were burned during the last month. Fortunately no one was in the buildings at the time of the outbreak, for, in one case at least, the building was stuffed with scenery in a way one would not think to be now possible. In London within the past week lives have been lost by an ordinary shop fire. Means of prevention must be sought. Fire-resisting materials are getting much more available, and they only should be used. They should be applied scientifically, so as to minimise danger. We are much behind foreign countries in our regulations for public and private buildings as regards fire prevention. It is a hundred times more important to the present generation that old buildings should be fire-resisting than that new buildings should be so built. The power to compel this is very limited. The architect should get it done voluntarily. Fire and panic in places of worship are rare; therefore provisions for safety have not been very much considered. The greatest catastrophes from fire, however, have occurred in churches, and there are plenty of narrow escapes even now.

There are about ten fires in the Metropolis every day—not a large average considering the number of buildings. Fire insurance discourages foresight and precaution. Hence comes risk and loss of life—the latter too frequent, though happily not to any great extent at one time. The public appear absolutely indifferent, and laugh at precautions whether in places of assembly, workshops, or houses. This is not the view to be taken by the architect. He should be a diligent student in such matters, if not an expert. He should try to work with the municipal authorities, and not thwart them, or be content with fulfilling the bare letter of the law.

All laws which affect one's temporary interests seem harsh. Parliament will never pass building laws which go as far as students or experts think to be necessary, nor even so far as the skilled and prudent architect may consider it advisable to carry out in his work. In all our recent dealings with places of public amusement and factories an enormous amount of improvement has been effected by the public voluntarily. When such is the case the law can be strengthened so as gradually to bring unwilling persons into line.

The architect can do much more than he may expect to persuade and convince his client that good building is cheap building in the end. The rebuilding of the Cripplegate area is a striking instance of what may be done in individual cases by the action of the architects. We may hope to raise the general standard of practice to such a level as the Institute feels to be necessary.

DISCUSSION.

A communication was read by the secretary from Mr. Arthur Cates, in which he specially pointed out the necessity for making the roofs of buildings fireproof, a feature which was, unfortunately, considered by many architects as needless. The Building Act provided that the roof should be covered with slate or other incombustible material, but this was only the minimum, and it ought to be the architect's duty to see that catastrophes were not caused through insufficient protection in this part of the structure. He mentioned how timberwork might prove a great deal more fire-resisting than steelwork, and expressed the hope that those who had charge of our great national art treasures would put the roofs in a reasonable condition of safety from fire. With regard to the provision of water fittings in theatres and similar buildings, he pointed out that these ought not to be kept, as they so often were, rolled up in a glass-fronted case, but should be connected up ready for immediate service. He also mentioned what a danger there was with shop fronts composed of great sheets of plate glass, insufficiently supplemented by proper supports for the floors above.

The chairman of the Building Act Committee of the London County Council, Mr. D. Waterlow, said that what they, on the committee, had purely to deal with was the saving of human life; they could not consider a question of cost. As regards theatres, it was panic and not fire that was important to them, and it was the smoke which was in almost all cases the cause of disaster. The work of the Council had been greatly criticised in connection with factories, especially because of the number of serious fires that had occurred in these buildings. They had, however, done their best. He mentioned that in London there were a number of factories quite unsafe, simply having a single staircase for escape, and, of course, with only a little fire, this would become choked with the smoke. To get over that deficiency they would require that there should be one really fireproof staircase, for in factories where there were often a great many women the danger of panic was immense. The Council were unable to use their power unless there were more than forty persons employed on the ground floor, and he mentioned how in a factory where only eight persons were engaged one failed to escape when a fire occurred. It was therefore of the utmost importance to provide against the staircase becoming filled with smoke, and for this reason special attention was required to everything at the bottom of the staircase. In the matter of means of escape from high buildings, the Council could only deal with new buildings, and he would ask all present to remember this aspect of the question in connection with repairs to old buildings and to do all that lay in their power to render them as safe as possible.

Sir John Taylor, the next speaker, said that the earliest example he knew of fireproofing was at the National Gallery, where fire pots were first used in the floor construction. The provision required by Mr. Blashill that all flooring should be nailed close down on the concrete, and the ceilings treated similarly, had a disadvantage, for it then made it difficult to deal satisfactorily with the wires and gas pipes in a house, which were thus exposed. With regard to the Record Office and the new Admiralty building, he mentioned that both had roofs of absolutely fireproof construction, the former having a roof built and covered with iron, protected by a fireproof ceiling below. He said that he would do his utmost to see that in connection with new public buildings, Governmental and otherwise, the best fireproofing methods were employed; but the cost was always a great consideration.

Mr. W. E. Reilly proceeded to mention a few points worthy of notice in the by-laws relating to fireproof construction in the Greater New York Building Code, which came into force on Tuesday, December 12th. This code had been in preparation for some two or three years, and was most complete. There was a rule in it as to the height of public buildings (the words "public buildings" were used in a wider sense there, including restaurants and lodging houses), limiting the height of a building built without fireproof construction to 35ft., without any limit as regarded area; every building which was over 75ft. in height had to be constructed entirely of fireproof material. In regard to theatres, it was required that there should be one main street in front and two side streets on its adjacent sides. The passages had to be 7ft. in width on each flank when the building gave accommodation for 1,000 persons, and 10ft. when for 1,800 persons. A much more efficient means of escape than by staircases had been adopted, by leading the exits on to fireproof slopes, confined to a rise of 1 in 12. There was also a regulation which was a great improvement on the system in London—a place of amusement was never permitted to be in connection with any other inhabited building, such as hotels, and factories. This would, of course, in London do away with the present music halls. He added that it was of great importance to provide quick exit, as nearly always it was found that persons killed in fires had not been burnt but asphyxiated.

Mr. Edwin O. Sachs, in proposing a vote of thanks to Mr. Blashill for his paper, called attention to two important points in the paper: first, that architects were always too prone to think that fire-prevention had been arrived at when the Building Act by-laws had been attended to—they should understand these were a minimum; and, secondly, with regard to the application of fire-preventive materials to old buildings. Mr. Sachs' opinion was that in nine cases out of ten the client would not think or talk of fire-prevention; he would, however, consider the drainage, and it would take an equal time to that expended in bringing him to regard drainage as important, to make him aware of the danger to human life by fire. He, the speaker, personally preached exit before construction; if they could only get people to construct proper exits the duty and responsibility of the public authority was ended. The factories, he was happy to say, were not being built in London, but were going to the suburbs for various reasons, and the more manufacturers could be encouraged to do this the better. The hotel question was one of the most important in the prevention of fire, and he thought it was high time that something should be done to protect people in buildings where they congregated by night, as much as where they congregated by day. He was of the opinion, after due consideration, that at the present moment nine out of every ten hotels in London were death-traps.

Mr. H. H. Statham made a few remarks in regard to theatres. He had noticed that the audience usually endeavoured to get out through the door they came in by, and as often as not this was crammed in one corner, so that in case of fire there would be a stampede to this exit, and a blocking would ensue. This could have been avoided by symmetrical planning of the site, giving an equal exit at each side.

Mr. C. Forster Hayward pointed out how extremely careless workmen often were when repairing buildings, and thought that staircases ought always to be supported on the outer as well as on the inner side.

The president, after referring to the moral responsibility of the architect in not only complying with the regulations but in doing what he knew was needed, agreed that the matter of exits was more important than that of fireproofing, and said it would be a good practice if a plan were hung up in every room of a hotel to facilitate the escape of the occupants.

Mr. Blashill briefly replied to the vote of thanks which had been proposed, and the meeting then terminated.

For the Admiralty Harbour Works at Dover, Messrs. Pearson successfully laid the first block last Friday. It weighed forty tons.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"A Gothic cathedral strikes one like the enthusiasm of poetry; St. Paul's, like the good sense of prose."—WALPOLE.

Quotations Wanted. THERE must be many of our readers who, in the course of their wanderings in the highways and by-ways of literature, have from time to time lighted upon some quotable passage, containing a fine thought finely expressed, and bearing very closely upon the interests represented by this journal. We invite any such to send us the passages which have most impressed them, so that their fellow readers may share the pleasure and inspiration they have themselves received. By thus enlisting the services of our readers we hope to obtain for publication at the head of this column a number of aphorisms or notable sayings which would otherwise have escaped our notice. Quotations may be either in prose or verse, but it should be remembered that their value for our purpose depends chiefly upon their brevity and their appositeness. We do not offer a prize for these quotations, thinking that our readers will find pleasure in pointing out to others some of their own favourite passages, but we shall be pleased to send the current issue of the ARCHITECTURAL REVIEW, as an acknowledgment of the courtesy, to everyone who sends a quotation we consider suitable for our purpose.

Kirkstall Abbey. SITUATED in a beautiful vale watered by the river Aire, stand the picturesque remains of Kirkstall Abbey, one of the two abbeys which we illustrate in our inset sheets this week. It is situated about two miles and a half west of Leeds and is undoubtedly a fragment of the monastic splendour of the twelfth century. The abbey is of the Cistercian order and was founded by Henry de Lacy in 1157. Parts of it are now in a very dilapidated condition, but alterations have recently been made, especially to the tower, which was much in need of support. The tower was built in the time of Henry the Eighth, and remained whole until January 27th, 1779, when three sides of it were blown down, leaving only the south side standing, part of an arched chamber leading to the cemetery and part of a dormitory. The site of the monastery was granted in exchange by Henry the Eighth and Edward the Sixth to Archbishop Cranmer and his heirs, but soon afterwards it passed out of the family. The abbey now belongs to the Leeds Corporation, having been presented to them by the late Colonel North. The sketch at the right-hand corner of the plate was taken from the south-west side, and shows the abbey as it looked before the recent alterations were made; it also shows the position of the measured doorway, which is a good example of the Norman style of architecture. The columns are missing in many cases, and the mouldings and stonework are now decaying, owing probably to the chemical action of the air of Leeds and the manufacturing neighbourhood.

Whalley Abbey. THE parish of Whalley, situated about four or five miles north-west of Burnley, in Lancashire, is one of the most extensive in England. It is chiefly in the Blackburn hundred, the parish itself extending eastward to the West Riding of Yorkshire. Whalley Abbey (parts of which are still in good restoration, as shown on our inset plates), was built in the year 1296 for the white or Cistercian monks of Scanlan, by Henry de Lacy, Earl of Lincoln. The abbey flourished until the Dissolution. Afterwards, the monks, encouraged by Aske's rebellion, resumed possession of the building, for which act the abbot of Whalley was executed. In the ruins of Whalley Abbey there still remain some very good examples of tracery windows in the Decorated style of English architecture; also two stately gateways and a building conjectured to have been the abbot's private oratory or chapel. There are also some good specimens of the Perpendicular style. Three plain stalls, together with some excellent wood screenwork, now decorating the Early English parish church of Whalley, were originally situated in the abbey. The illustrations of both Kirkstall Abbey and Whalley Abbey are from measured drawings by Mr. Sidney H. Rhodes, Regent's Park, N.W.

An Expensive Refurbishing. £90,000 is the sum which the French Minister of Fine Arts intends to ask the Chamber for, this being the estimated cost of sweeping and garnishing the national palaces and the residences of the various ministers in view of the exhibition. About £26,000 will have to be expended on the Elysée Palace alone to make it presentable. The minister draws rather a piteous picture of the present condition of M. Loubet's residence. Much of the furniture badly requires renewing, the chairs need to be recovered and restuffed, and the curtains and hangings are faded or altogether worn out. This item will run away with £15,000. Nearly £4,000 will be wanted to make the table service worthy of the President and his guests. The service at present in use dates from 1879, and, as the result of much breakage, is quite insufficient even for ordinary requirements. Sturdy democrats should be mollified at learning that M. Loubet is often short of plates and without a proper complement of soup tureens. His stock of wineglasses, too, is wholly inadequate, and will have to be replenished if the visitors to the Elysée in 1900 are not to be condemned to a compulsory use of the loving cup. Most of the ministers have similar complaints to make as to the way in which they are lodged, and are to receive grants of varying importance to put their establishments on a proper footing. There will therefore be a wholesale scrubbing and rubbing and making bright, in order that the august personages may be respectably housed.

A Survey of the Soudan. AFTER the fierce arts of war come the gentle arts of peace, so that while, not so very long ago, we were eagerly reading accounts of great military movements in the region of Khartoum, and of the advances of innumerable hordes of armed savages, it is now announced that an archæological survey of the Soudan is to be immediately undertaken. In fact, the first step in this direction has been made by the Egyptian Government appointing Mr. Howard as inspector of antiquities for Upper Egypt and the Soudan. Mr. Howard has been identified with the Egyptian Exploration Fund; besides, the appointment of an Englishman will be specially welcomed in this country by Egyptologists and all interested in antiquities of the land of the Pharaohs, as hitherto posts of this character have invariably been given to Frenchmen. Mr. Carter is at present engaged at Thebes in completing his work at the temple for the Egypt Exploration Fund, but it is understood that this will be his last season there, and early in the New Year he will enter upon his new duties. It is hardly necessary to add that a proper survey of the land connected with the first great civilisation is likely to be highly interesting and profitable.

An Old Churchyard Cross. THE base of the old churchyard cross at Mytton All Hallows, Yorkshire, has recently been discovered, and has been placed for the present in the Sherburne Chapel. The head of the cross is in a fair state of preservation, and has been restored as a memorial of the Queen's Jubilee. It has been thought by some antiquarian experts that Mytton Cross was as old as the time of Paulinus, but the recent discovery of the base enables the date to be assigned to a much later period, the general character being Early English or possibly Norman. The base is a large square block of stone, splayed in its upper portion and terminating in a hexagonal support, into which the shaft of the cross was inserted. The head of the cross is of the familiar early type, with a crucifix in low relief on a sunk panel, bordered with a looped cord, having fleurs-de-lis at the corners on one face, while the other shows the rood with attendant figures, also in a sunk panel, with rough tabernacle work. The missing finials, formerly belonging to the tower at Mytton Church, have been identified on the gables of an old Tudor building in the village.

Old English Inns. WHEN he had briefly sketched the rise and development of the English inn from the old Roman days to the climax of its fame in the early Victorian Era, Mr. W. Fitzwater Wray (in the course of a recent lecture at Bradford) commented on the decay of the inn consequent upon the introduction of railways, which, he said, had changed it generally either into a big hotel, where the visitor was one of a number, and Boniface was a young lady clerk in a glass house, or to a loathsome plague-spot, where the landlord's only concern was to get the maximum of liquor down his customer's throats before 11p.m.—The lecturer then took the audience with him on an imaginary tour round England, even into the corners of Cornwall, Dorset, Kent, and Essex, in quest of the old inn. In a chatty, bright and humorous manner, he associated the old inns visited with brilliant word-pictures of the stirring times of the Wars of the Roses and the great Civil War. Those inns around which the glamour of the genius of great novelists, poets and historians has been thrown were realistically described, a special feature being made of the inns associated with the works of Charles Dickens. Mr. Wray also referred at length to the holy inns of Glastonbury and Alfriston, and the pilgrimages with which they were connected.

Memorial to Charles the First. THAT much-abused and much-belauded monarch Charles the First was executed two hundred and fifty years ago, and it is now proposed that he should have a memorial. At Carisbrooke, where Charles spent many months of captivity, and where his young daughter Elizabeth pined and died with her cheek upon her open Bible, it is proposed to restore the ruined church in which both worshipped. The castle being Royal property, permission has been refused unless the work can be thoroughly, though not expensively, done; and for this £1,000 is required, of which only £200 has been collected. This parish church is much needed for the outlying inhabitants, who are far from any church, and both the Princess Henry of Battenberg, as Governor of the Island, and the vicar of the ruined church, are anxious that the work shall be carried out. Miss Charlotte M. Young, who is the zealous advocate of the proposal, says that when Cromwell, who defied and overthrew the Government, has actually been commemorated by a statue outside the Houses of Parliament, surely the devoted King ought to have his memorial, not in a personal image, but in the restoration of the fallen temple of his Lord.

Discoveries at Rochester Castle. THE repair of the fore-building of the ancient Keep of Rochester Castle, which has been carried out under the supervision of Mr. George Payne, secretary to the Kent Archæological Society, is now completed. The battlements were found to be in a very ruinous state, while the eastern wall of the chapel, the remains of the roof of the chancel, and the chancel arch were also in great need of restoration. The original Norman masonry has been disturbed as little as possible. During the repairs to the roof-line of the nave, a fine Norman two-light window was discovered blocked up in the south wall (the north wall of the Keep), and this has been opened by the removal of the plastering. Another interesting discovery was made in the State dungeon, an air-shaft communicating with the lower dungeon being found and opened. As is well known, the Keep of Rochester Castle is one of the finest castellated ruins in the kingdom.

A Maker of Modern Paris. A MONUMENT to Alphand, to whom Paris owes its present aspect almost as much as to that other great innovator, Baron Haussmann, though the latter was undoubtedly the pioneer, while Alphand continued his improvements and completed them with ideas of his own, has been unveiled in the Avenue du Bois de Boulogne, Paris. Alphand's specialty was trees and public gardens. It was he who converted the Parc Monceau from a dreary stretch of waste ground into the present miniature, but dainty, park, and it was he who endowed the east end of Paris with the Buttes Chaumont, the most picturesque, perhaps, of the public gardens of the capital. Alphand, too, organised the magnificent greenhouses and nursery gardens now in the possession of the city of Paris. It was from this source that were drawn the horticultural embellishments that were a feature of the Exhibition of 1889, and the institution will furnish still finer results next year. M. Dalou, the sculptor, has disregarded all the traditions of classic art, and has depicted Alphand, in a short jacket, and wearing his famous soft felt hat, chatting familiarly with Bouvard and Huet, two of his chief assistants. The group is conceived in a purely realistic spirit, and is a striking departure from the rather stilted rules still honoured among almost all the sculptors entrusted with the execution of public monuments.

The City of Mexico. THE Federal District of Mexico comprises an area of 424 square miles, and is divided into the municipality of the City of Mexico and the smaller suburban municipalities (prefecturas) of Tlalpam, Tacubaya, Xochimilco, and Guadalupe. In the last report from our consul there it is stated that the development in building still continues with great activity. This period of improvement began about ten years ago, and has continued increasing steadily. The houses in the city were mostly of the old Spanish type—a large yard with the rooms around it. Modern requirements are such that many of these old edifices have been demolished, and those of modern style have been erected. The City of Mexico, which was once called the "City of Palaces," might well retain a sort of relative claim to that title, but only in so far as concerns the buildings occupied by the better families. Like all large cities, it is extending to the west, and what was once the aristocratic and fashionable quarter is almost given up to commercial enterprise. All the large and handsome courtyards and entrances along the principal streets are now turned into stores and showrooms, and the entrance to the houses is by a narrow passage from the street to the stairways, situated in most cases in the inner part of the buildings. The families who formerly occupied these buildings have now moved to the newer portions of the city, where some really handsome edifices are in course of construction. The same spirit of improvement which has acted upon private persons has also had its effect upon the municipality. During the last three years it has acquired several large and valuable properties, which have been demolished to make the principal thoroughfares wider, so as to meet the requirements of increased traffic. Among others may be mentioned the line of streets starting from the south-western corner of the main square. This line of streets, belonging to the early period of the Conquest, had on its northern side a series of arcades, which in their early days may have been of great service, but owing to the subsidence of the soil they have been gradually sinking, and this, added to the cracks caused by earthquakes, made them a source of danger to the surrounding property. Since 1889 the amount of taxes paid on houses has doubled.

Under Discussion.

TWELFTH CENTURY BUILDINGS IN APULIA.

At a meeting of the Edinburgh Architectural Association last Wednesday, Mr. F. W. Deas, architect, read a paper on "Twelfth Century Buildings in South-Eastern Italy." After a short historical introduction and a description of the character of that part of the province of Apulia which borders on the Adriatic, the lecturer dealt with various churches, dating from the end of the eleventh to the middle of the thirteenth century. These were fairly similar in plan and treatment, having a lofty, narrow nave flanked by side aisles, with recessed chapels; the transept was aisleless, and of the full height of the nave, and no chancel intervened between the eastern apse and the body of the church. The building material was tufa or travertin, with a free use of marble, and the colour of the walls from long weathering was sometimes of great beauty. Splendid as were these churches in their scale, proportion and simple decorative treatment, they were not less noteworthy for the spirit and execution of the carved ornament, which, at its best, ranked beside the noblest carving in the world. This was found more especially at Trani, Bari and Bitonto.

ART EDUCATION.

Mr. Walter Crane said on Thursday last, at the prize distribution at the Camden School of Art and Science, Tufnell Park, N., that though science might claim the first place in popular attention, he thought that the importance of art to commerce was hardly less than that of science. A great deal depended on design, pattern, construction, and form in connection with commercial value, and the importance of art could scarcely be over-estimated. Art was, after all, but the careful cultivation of the natural sense. He ventured to think that if two children received their educational start in life, one on the basis of ordinary elementary knowledge, reading, writing and arithmetic, and the other on what might be termed the graphic and artistic basis, one would be found fully equal to the other at the finish. If there should be any advantage he thought it would probably lie with the pupil who had been trained on the artistic side. He was afraid that we aimed at too high a level of general knowledge and expected equal proficiency from all, forgetting how diverse were our tastes and capabilities. He deprecated the depreciation of ambition in art. Ambition was not discouraged in the gymnasium, why should it be in the art school? If an artist made a great attempt and failed, the effort would be at least educational, and would encourage him to renew his attack. He could not think ambition in art such a crime as it was sometimes considered. The domain of art was like an enchanted forest to students, and though they might wander into by-ways they never forgot the aim with which they entered the wood. Some quest would ever lead them on, and however that forest might have been explored there was still something fresh to be discovered. If they eventually found that truth and beauty were one, and the very soul of art, their aim would have been realised.

THE ARCHITECTURE OF THE EAST.

Professor T. Roger Smith, of London, recently delivered a lecture on "Oriental and Indian Architecture" before the Sheffield Society of Architects and Surveyors. He began by pointing out the differences between Western and Eastern architecture and art generally resulting largely from difference in race, in climates, and in religion. The earliest monuments in India were topes or mounds for the preservation of sacred relics. These are Buddhist and date back to before the Christian era. Round these are procession paths, enclosed by great posts and rails in stone, imitating timber, and profusely enriched. The carving from the Amravati tope, now in the British Museum, was elaborate and extensive. Bhuddism was succeeded by the Jain religion and architecture, whose temples included high roofs and domes and furnished suggestions for what followed. In all Indian architecture profuse ornament and constant repetition were invariable. The high pyramidal roof was constantly met with, also the pier and bracket. Another feature of constant occurrence was slabs of stone perforated in patterns to fill in the windows. Most of the great temples stood in an extensive enclosure, with gateways, with high roofs. Next came the true Hindu temples, which differed in the North and South of India; the high roofs in the North were straight sided and profusely ornamented, while in the South lofty gourd-shaped domes were employed, differently ornamented. The Saracenic or Mohammedan architecture, which was the next type, introduced by Mogul invaders in the eleventh century, had its origin in Arabia, Egypt and Syria. The lecturer described the nature of a mosque, pointed out the early introductions of the pointed-arch Mohammedan buildings in Delhi, Ahmedabad and Agra, and went on to describe in detail the Taj at Agra. The lecture was illustrated by lantern photographs of temples in various parts of India, of the Buddhist tope at Sauchi, and of Saracenic buildings in Cairo and India.

LONDON ART GALLERIES.

Mr. E. T. Cook lectured recently at Toynbee Hall, Whitechapel, E., on "The Art Galleries of London." Mr. Hugh Stannus presided. The lecturer said that in the picture galleries of the metropolis, open free to all, were vast treasures which millionaires might envy, but which no millionaire could ever buy. These collections were obtained for the nation through princely private benefactions and by large public expenditure. And yet anyone who spent much time in the treasure-houses of London was struck by two things—first, that there was scarcely anyone there; and, secondly, that the few who were there seemed terribly bored. There were many reasons for that state of things, the principal one being that visitors tried to see too many pictures at the time, or did not know what points of interest to look out for in them. Pictures, apart from their artistic merits, often possessed accidental points of interest from associations with their painters or former owners, or because they were obtained with difficulty at enormous prices, or were picked up for a trifle and turned out to be treasures; and if those stories of pictures were known, visits to the art galleries would be more enjoyable. The famous Madonna, by Raphael, in the National Gallery—one of the most perfect pictures in the world—was bought, as was generally known, from the late Duke of Marlborough in 1884 for £70,000, far and away the greatest price that was ever paid for a picture. Lest anyone might be inclined to think that this was an extravagant use of the taxpayers' money, it should be known that the purchase was made by that strict economist, Mr. Gladstone. He remembered once hearing Mr. Gladstone refer to the matter. He thought that, looking back on the transaction, Mr. Gladstone's economic conscience had some qualms, but, on the other hand, he had a very good defence. The price given was, Mr. Gladstone admitted, a very large one, but the price demanded by the owner, and even the price recommended by the directors of the Gallery, was very much larger. Mr. Gladstone formed his own opinion of the value of the picture, stuck to the price he offered for it, and after prolonged negotiations it was accepted, with the result that the country was saved £30,000 as compared with the value put upon the picture by Mr. Gladstone's own expert advisers.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

At the third sessional meeting of the British Archæological Association, held at 32, Sackville Street, Piccadilly, Mr. C. H. Compton in the chair, Mr. R. Quick, curator of the Horniman Museum, read a paper he had prepared upon "The Eolithic Stone Age" which was illustrated by diagrams and a large number of specimens of flint implements. Mr. Quick said it was the opinion of many archæologists about eighteen or twenty years ago that the Palæolithic age was the most ancient period yielding decisive proofs of the existence of man. Since then great discoveries had been made and most scientific men now divided the Stone Age into three epochs respectively; first the Eolithic or dawn of the Stone Age, secondly the Palæolithic or Early Stone Age, and thirdly the Neolithic or Later Stone Age. Upon the plateaux of North Kent, some twenty or thirty miles distant from London, at heights varying from 400ft. to 800ft. above the sea level, many thousands of specimens of flint implements had been discovered, and carefully collected and classified by Mr. Harrison of Ightham. They differed in type from the implements found in the river-gravels or the polished tools of the Later Stone Age. A noticeable feature of difference between the types was the absence of the large massive implements common to the Palæolithic period. The implements found on the plateaux were mostly of small size and fitted for use without a haft, the heads also being generally worked round all the edges so that they could be used in different positions and on all sides. The Eolithic implements might be termed the prototypes of the later implements. Early man did not consider form of importance; he wanted something that he could hand, grip and use as an edged tool. Nature probably suggested the form most suitable amongst these flints for his purpose and a little working of his own upon them gave him all he needed for his simple habits. Many of the implements were naturally split flints which had been worked on one side only, the chipping or working being generally of a character such as could not have been produced by accident or by natural causes; and this chipping appeared always on the side opposite to a good hand grip, which fact must have been an important consideration with the primitive man.—The chairman, Mr. Gould, Mr. Williams, Mr. Rayson, and others joined in the discussion that followed.

FORTS OF THE SOUTHERN PICTS.

At the last monthly meeting of the Society of Antiquarians of Scotland, held at Edinburgh, Dr. D. Christison, the secretary, gave an account of the ancient forts of Perth, Forfar, and Kincardine shires. This region is well marked off by nature and by the isolation of its forts from other groups, and, with Fife included, comprises the historical area of the Southern Picts. The forts may be classified for description as: (1) remains marked "mote" or "moat" on the Ordnance maps, and others which seem to resemble them; (2) forts apparently mainly or entirely of earth; (3) forts apparently mainly or entirely of stone; and (4) sites with little or no definite remains, excluding, however, the so-called Roman camps. Although some six or eight resemble military motes, there is only one that closely corresponds to the type, namely, Cairn Beddie, the Macbeth's Castle of the "Statistical Account." Of the dozen or so of earthern forts, the best example is Green Castle, on Ferdun Water, near Fettercairn. Of the stone forts, which number twenty-three, several are among the largest and most interesting in Scotland, such as the Caterthuns, Dundurn, Caisteal Mac Tual, on Drummond Hill; Barry Hill, Alyth; Finhaven, Abernethy, Forgandenny. The Laws, Monifieth, and Dundee Law. Dr. Christison specially referred to the famous Dunsinnane, and a remarkable example, hitherto almost unknown on Turin Hill, near Forfar. Dunsinnane, which has had more notice than most Scottish forts on account of its association with Shakespeare's Macbeth; it was partially excavated in 1854. There seems no doubt that it was surrounded by a dry stone wall, with well-faced castings, standing on solid rock, and that the so-called underground houses within it were really above ground, also on the solid rock. Referring to the general conclusions as to the positions of the forts, it seemed that there was a marked distinction between the low position of the earthworks and the lofty position of the stone forts. Comparing this district with Argyle, for instance, in which there were few or no earthern forts, the size and preponderance of the forts of stone was the characteristic feature of the former. A variety of these stone forts had attracted much attention and speculation on account of their showing more or less vitrifaction, and the distribution of these was an important question, for which there was scarcely sufficient information yet collected. Much still remained to be done in the way of careful surveys and judicious excavation before it was possible to arrive at final conclusions.

In another paper, Dr. James T. Richardson, North Berwick, described two ancient interments and a kitchen midden recently discovered in that neighbourhood. The latter consisted of a cist measuring about 3ft. by 2ft, at a depth of about 18in. only below the surface. In one of the bunkers recently formed in the Rhodes Links pieces of old pottery were exposed by the drifting of the sand, and on digging to the depth of 3ft. an area of fine black earth, about 15ft. by 9ft. and about 2ft. deep in the centre, thinning off to the outer margin, was disclosed. A well-marked stratum of shells ran through it, and pottery, bones and wood ashes were mingled through its substance. The pottery included a fine buff-coloured ware, a red kind with a greenish glaze, and a very coarse grey variety, and there were at least twenty different patterns of rims. It was found possible to reconstruct one of the vessels sufficiently to show that its shape was oval, with sides nearly perpendicular and measuring 7in. in depth by 11in. in the longest diameter, the inside being coated with a bright yellowish glaze and the outside encrusted with soot.

Correspondence.

ELLIPSE BY COMPASSES.

To the Editor of The Builders' Journal.

Walton-on-Thames.

Sir,—When writing the above article I was not so sanguine as to suppose that everyone would at once and entirely endorse what was therein written. Opinions differ upon any subject, and especially will this be the case upon such a matter as the present one.

Replying to Mr. Marsden's letter in your issue of the 13th inst., allow me to say that it is necessary for Mr. M. to know the difference between "the compass" and "the compasses" in connection with an ellipse. He is not quite correct in saying, "This article is supposed to be the execution of an impossibility." I will not go so far as to say the impossibility is dead, but it is so eliminated that it is practically so, so far as describing the figure of an ellipse with compasses is concerned.

Mr. Marsden says he "is greatly interested in the striking of this curve"; yet, just previously, he says it cannot be struck. If he has a better method than mine for doing it I am glad, and hope he will soon make it public. We are well aware that approximate ellipses have been drawn for centuries—Mr. Marsden says "many hundred years." We also know that for the want of a better method, these more or less approximate substitutes are used every day at the present time, as anyone who takes his walks abroad, in daylight, may see for himself.

With regard to the statement of the S. and A.D., while acknowledging the greatest respect for those in authority upon the matter, I attach more importance to the opinions of half-a-dozen practical men whose occupations require the frequent use of the compasses in describing ellipses. I have met more than one Science and Art student who did not know how to describe an ellipse by trammel, much less how to erect a perpendicular at any point on the curve. It is necessary to thoroughly understand the construction of these figures before we can with satisfaction to ourselves set them out on paper. Any novice can very easily test his curves if he understands how to find the foci of an ellipse; this is simply shown in the article of the 6th inst. Take any number of points on the curve, and from the foci draw two straight lines to any one point on the curve; the lines thus drawn from the points on the major axis to the point on the curve form a triangle, the two legs will, if added together, exactly equal the major axis of the ellipse, that is, if the curve be correct.

There are, of course, many ways of describing ellipses, but I am afraid we must call the result in every case an approximate one in order to avoid hairsplitting. For instance many use the "string and pins" method; others use "cotton and needles;" others lines; others find points in the curve, then fill in by use of French curves, or by hand, for drawing on paper; while others use the trammel, elliptic compasses, or ready made elliptic curves.

To return to Mr. Marsden. He says, "I think that anyone who draws the curves to a large size—that is, one by the use of the trammel and the other by this "new" method will easily see that with given axes the curves do not agree."

I have "drawn" semi ellipses from half-an-inch, up to 3ft., major axis, on paper easily and correctly, and have no hesitation in saying they can be described much larger with but slight modification of the longer radius. His statement that "no approximation gives such a beautiful line as the true ellipse" is equivalent to saying that a spurious half-a-crown is not so desirable as half-a-crown of sterling silver, which fact is recognised by almost everyone. Sir, in order to make more clear that what I wrote in your issue of December 6th is of easy accomplishment, namely, the construction of ellipse by compasses and straight-edge only, I am willing to submit to you, for the inspection of any number of gentlemen who may be interested in the subject, and who will pass an unbiassed opinion upon them, any further drawings of a similar nature to those already published in your paper. The drawings will be sufficiently explanatory of themselves in order not to intrude more than absolutely necessary upon valuable time. I do not think I can do more than this, but I will gladly do it, so as to give your readers generally an idea that such an operation is not so difficult as it seems to be.—Yours truly, ROBERT RAMM.

Temporary Art Gallery for Hampstead.—Acting upon suggestions made by Sir L. Alma-Tadema, R.A., Mr. G. Storey, A.R.A, Mr. David Murray, A.R.A., and the Hampstead Art Society, of which her Royal Highness Princess Louise is the patron, the Works Committee of the Hampstead Vestry have decided to allow the small hall of the Vestry Hall on Haverstock Hill to be used as a temporary art gallery.

Carpenters' Company Examination Result.—The Carpenters' Company held their annual examination in Sanitary Building Construction at their Hall on December 7th and 9th, the number of entries being quite up to those of previous years. The series of free lectures held to help the candidates proved very successful, and the attendance was greater than ever before. Among the examiners were Professors T. Roger Smith, Henry Robinson and A. Wynter Blyth, and Mr. John Slater, B.A., F.R.I.B.A. The following is the list of successful candidates, arranged in order of merit:—Gold medals: Messrs. Alfred Carter and A. C. Remnant (equal). Silver medals: Messrs. A. Harrington and G. P. Knowles (equal). Bronze medals: Messrs. C. B. Burnett, C. W. Denny, W. H. Richardson Jones and A. D. White (equal). Certificates: Messrs. C. A. Sales, J. Greenwood, Hugh Byron and W. Sargeant (equal), A. W. Holley, H. Prosser, Ernest Leney, and Scott Addison. Three candidates sat to improve their positions, but failed to do so, though they fully maintained their former positions. Their names do not appear in the above list.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

PALLADIO'S "CLASSIC ARCHITECTURE."

Cardiff.—Leigh writes: "Will you kindly inform me what is the value of Vol. I. (dated 1776) of Palladio's work on classic architecture."

The book is not worth more than 5s.

BOOKS ON MONUMENTAL WORK.

Nottingham.—Monumenta writes:—"Can you give me some particulars of books on monumental work and estimating?"

"Ancient Sepulchral Monuments," by William Brindley and W. Samuel Weatherley, F.R.I.B.A., containing 212 full-page plates (15in. × 11in.); price £3 3s. "Estimating," by George Stephenson; price 5s. 6d. "Alphabets Old and New," by Lewis F. Day; price 3s. 6d. These books can be obtained from B. T. Batsford, 94, High Holborn, W.C.

STRENGTH OF CONCRETE SLABS.

Greenhithe.—F. J. W. writes:—"The article on page cxl. of the supplement to the Builders' Journal for December 6th on the strength of concrete slabs would be exceedingly interesting if only it contained a little more information as to the size of the slabs. The breaking weights are carefully recorded, even including the odd pounds, and yet the only definite dimension given, beyond the respective thicknesses, is contained in the statement that 'all were 4ft. wide.' Presumably, this means 4ft. clear span between the supports. It would be well if you could ascertain and publish the superficial area of the slabs, so that the load per foot super. could be calculated."

We have ascertained that the twelve slabs were of the following lengths: Nos. 1, 2, 6 and 10 were 8ft. long; Nos. 3, 5, 7 and 11 were 6ft. 6in. long; and Nos. 4, 8, 9 and 12 were 5ft. long. As stated, all were 4ft. wide.

POWERS OF A CONTRACTOR.

Anxious writes:—"A contractor has been building for me and has failed to complete within the specified time. My architect has not deducted the penalties from the account, according to contract, his excuse being owing to extras, wet weather, &c., and my taking possession before completion. He has certified for the balance to be paid to the contractor. If I refuse to comply with the certificate, has the contractor power to sue, and, if he does so, what is my best course to adopt?"

"Anxious" can be sued by the contractor. He could set up the penalties as a set-off or counter-claim to whatever sum they may amount to, but would be met by all or some of the grounds on which the architect has justified his certificate. I do not think he ought to defend an action, if brought, and he ought to avoid having an action brought against him by paying the certified amount or anything less that the builder may under the circumstances be willing to accept. A. H.

CUBING BUILDINGS FOR COST.

Moseley.—F. S. M. writes:—"How do architects cube up their drawings so as to give their clients an approximate estimate? Take, for instance, a billiard room, 30ft. by 25ft. by 10ft., to be built of plain brickwork, with best tiles and fittings."

The ordinary mode of cubing a building for approximate cost is to take the area from the ground plan and multiply by the height from bottom of footings to half-way up roof. This may, however, require to be done in portions, when the building is not a rectangular block, as in the case of back additions not reaching the full height. Chimney stacks, buttresses, dormers, unless very unusual in number or construction, would be disregarded. The boundary walls may be taken as a separate item. The rate per cube foot will depend entirely upon the class of building and amount of decoration. A first-class detached dwelling house would be from 9d. to 15d.; a house of ordinary construction and medium decoration from 7d. to 9d.: a cheaply built suburban house from 6d. to 7½d. In speculative building the price can be kept down as low as 4d. or 4½d. per foot when the houses are built in terraces, but this does not allow for an architect's fees. "Leaning's Quantity Surveying" (Spon; 15s.) gives considerable information on pricing out per foot cube in various classes of building. Small buildings cost more in proportion than larger ones of the same style, and additions to existing buildings cost more on account of renewals to existing parts and making good old to new. A billiard room as described might cost from 9d. to 1s. per cube foot. HENRY ADAMS.

AUTHORITY OF DISTRICT COUNCIL.

E. J. E. writes:—"Plans of a proposed store having galvanised iron sides and roof are submitted to an Urban District Council, who approve them, provided that the building has 20in. stone walls and a roof covered with slates. (1) If the proprietor disregarded this decision and commenced erecting the building with galvanised iron, could the Council stop him? (2) Does a store come under the same by-laws as stables and dwelling-houses? The following are extracts from the local by-laws:—'With respect to the structure of walls of new buildings, for securing stability and the prevention of fires. The walls of every new building shall be constructed of such thicknesses as shall be approved by the Board, and the foundations shall rest on solid ground, or upon concrete, or upon other solid substructure. The external and party or side walls of every new building shall be constructed of brick, stone, or other hard and incombustible substances, unless the Board shall otherwise allow. The roof . . . shall be formed of, or externally covered with, incombustible materials, except in special cases, when otherwise allowed by the Board.'"

(1) Upon the information furnished, it does not appear that the proprietor of the building in question can disregard the decision of the Council. (2) A store appears to be a building of the warehouse class, subject to similar rules to those which govern the structure of walls to dwellings and stables, except that warehouse walls are usually required to be of greater thickness. It appears that the Council have power to exempt the building in question, but have not thought proper to do so. It is just possible, however, that the building may be exempt, independently of the Council's decision. Among the model by-laws of the Local Government Board relating to new streets and buildings, by-law 2A exempts certain buildings from the rules governing the structure of walls and allows such buildings to have walls of galvanised iron, &c. But have the District Council in this case adopted this particular by-law, and, if so, does it apply to the building in question? These are points upon which our correspondent might seek further information. G. H. B.

In an Article on Petersham Common in our issue for November 22nd we drew attention to the possibility of the destruction of that as yet unspoiled beauty spot. This risk is now remote, for, at the meeting of the Richmond Town Council last week, the offer of Lord Dysart to sell, subject to certain conditions, the whole of his manorial rights over Petersham Common (the slope of Richmond Hill) for £500, was accepted. The Lords of the Manor claim the right to cut the fine old timber on the common, and the effect of the sale would be to prevent any risk of this disfigurement of the landscape.

Professional Practice.

Aberfeldy.—Sheriff-Principal Jameson has just issued his decision in an appeal from the judgment of the late Sheriff Grahame in an action raised by Mr. William Bell, architect, Aberfeldy, against Mr. J. Guthrie Lornie, of Pitcastle. The plaintiff sued for a sum of £63 17s. 1d., being his account for professional services rendered to the defendant during a number of years. The defender took exception to several items in the account and submitted a counter claim. He tendered a sum of £38 8s. 9d. in settlement of the account sued for. Sheriff Grahame gave judgment in favour of the plaintiff for the amount sued for (less £2 2s.), and awarded him expenses. The defendant appealed to the Sheriff-Principal, who, after hearing the agents of the parties, has issued an interlocutor adhering to the Sheriff-Substitute's interlocutor, dismissing the appeal and finding the plaintiff entitled to additional expenses.

Armley, Leeds.—At a meeting of the Leeds Library Committee last week, the assessor appointed by the Leeds Corporation to decide who should receive the awards of £50 and £20 respectively offered for the best plans sent in for a new library and reading room at Stocks Hill, Armley, gave his report. The first prize he gives to Mr. Percy Robinson, architect, Albion Street, and the second to Mr. F. W. Bedford. Mr. Robinson's design shows a handsome structure, in which are provided a general reading room, an adult reading room, a juvenile reading room, and a lending department. The carrying out of the scheme will cost about £5,000.

Birkenhead.—On Tuesday in last week the opening of the Gladstone Liberal Club was performed by Dr. Spence Watson, president of the National Liberal Federation, who was presented with a gold key by the architect. The building is erected of brick with Pen-y-cae stone dressings, the front being faced with red pressed bricks. The accommodation includes a spacious billiard room for three tables, smoke room, reading room, secretary's office, refreshment bar, and lavatories on the ground floor. On the upper floor there is an assembly hall for 400 persons, a green room, and the storage and heating arrangements. The building is well warmed and ventilated, and fitted with every convenience for concerts, dances and banquets. The architect was Mr. T. Taliesin Rees, F.R.I.B.A., Birkenhead, and the contractors were Messrs. John Lee and Son, Bebington.

Falkirk.—A new Volunteer drill hall of the C and D Companies 4th V.B. Argyll and Sutherland Highlanders at Falkirk has been opened. It is built of red sandstone and has frontages to Comely Park Terrace and High Station Road. The building facing High Station Road is a two-storey one. On the ground floor there is the armoury (fitted for 300 rifles and equipment), officers' room, non-commissioned officers' room, orderly room store, and lavatories. On the upper floor there is a large reading and recreation room, and here also is situated the house of the sergeant-instructor. Behind this building is situated the drill hall proper. The hall is 100ft. in length and 60ft. wide and in the rear is a large store for gymnastic apparatus, &c. It has a plain but substantial front, and on the gable top is carved the regimental crest, consisting of entertwined L's for Louise, with the Princess' coronet; whilst on either side there is a representation of a boar's head and cat, the crests of the families of Argyll and Sutherland respectively. Messrs. A. and W. Black, Falkirk, were the architects of the building, the cost of which is about £2,500.

Ipswich.—The new church of St. John the Baptist has just been consecrated at Ipswich. The church erected some years ago provided seating accommodation for less than 400; the new church will hold something like 800 persons when quite full, but seating accommodation has been provided for 600. It is situated on the same road and within a few yards of the old church. The outer and interior walls are of red brick, with Monks Park stone dressings, the roof being of pitch pine, with Broseley tiles. The interior consists of a nave and side aisles, a clergy vestry at the north-west corner, communicating with a choir vestry. At the opposite corner is the organ chamber, the chancel being situated midway; the east window, with five lights and Gothic top, faces the roadway. The roof of the nave is supported off the clerestory walls, and the pillars dividing the nave from the aisles are of red brick, alternately circular and octagonal. The chancel is approached from the nave by four steps. Cathedral glass has been utilised for the windows. A four-light window at the west end is placed immediately over the roof of the baptistery, this portion of the façade being completed by a bell-turret, with provision for two bells. The space allotted in the organ chamber is 18ft. by 11ft. 9in. The pulpit is a handsome one of carved oak. The church was designed by the late Sir A. Blomfield, A.R.A., and Sons. The work has been carried out very satisfactorily by Messrs. Cornish and Gaymer, of North Walsham, under the superintendence of their foreman, Mr. George Gotts. The cost has been about £7,700, including the site and the furnishing. The church will be lighted by gas, Messrs. Hart, Son, Peard and Co., of Drury Lane, W.C., supplying the fittings and the Matchless Gas Lighting Syndicate the burners. The organ was formerly in the other church, but it has been added to by Mr. Thurston. The font also was brought from the other church, as it was given originally as a memorial. The lectern, which has been subscribed for as a memorial, consists of a handsome brass eagle and pedestal. The church chairs were made by Messrs. R. D. and J. B. Fraser, who were also entrusted with the carrying out of the whole of the church furnishings. The ground around the church has been tastefully laid out by Mr. F. Beer; and a number of shrubs and trees have been planted in the borders.

Leeds.—At a meeting of the Leeds Markets Committee held on December 12th it was definitely decided to recommend the City Council to adopt the plans prepared by Messrs. Leeming and Leeming, architects, Westminster, for the erection of a new market hall on the site of the present covered market in Kirkgate. Some months ago, it will be remembered, the Committee offered three premiums for the best plans submitted to them, and Messrs. Leeming secured the first premium of £150. The carrying out of their plans was estimated to cost £73,000. But at the Committee's last meeting it was resolved to have the building made two feet higher, so as to allow a little more space on the first floor, an alteration which will increase the cost by about £7000, bringing up the total to £80,000. Built of stone, the structure will be two storeys high, with a frontage of 275ft. to Vicar Lane, and with smaller frontages to Ludgate Hill and Kirkgate. It will cover an area of about 3000 square yards, or rather more than the present market. The position will be slightly different owing to a strip of land about 30ft. wide being required for making Vicar Lane a uniform width of 75ft. Additional land at the rear will, however, be taken by the incorporation of Harper Street, and this will more than equalise the area taken off the front of the present site. The designs show a structure in the Renaissance style surmounted by domes and turrets, and the building is surrounded by twenty-three large shops fronting Vicar Lane, Kirkgate and Ludgate Hill. In addition, eighty-six smaller shops are shown fronting in the market. About half of these are in the balcony. In the middle of the market, underneath the central dome, is a large ornamental clock, around which are a number of stalls. Altogether, there is space for eighty-four open stalls. The roof will be of glass, the outside framework being covered with lead. Two main entrances are shown—one at the junction of Vicar Lane and Kirkgate, the other at the corner of Vicar Lane and Ludgate Hill. Over each of these is a dome. The decision of the Committee, of course, requires the confirmation of the Council before tenders can be invited to carry out the work.

Plymouth.—At the last quarterly meeting of the Plymouth Borough Council two stained-glass windows in the north wall of the Council Chamber were unveiled. They were designed by Messrs. Fouracre and Son, of Plymouth, who executed the principal stained-glass windows in the Guildhall, and have been provided by the family of the late Alderman Edward James, in memory of their father. The windows typify two highly interesting periods in English history—the Elizabethan and the Victorian. At the top of the Elizabethan window the tracery is cinque-foil, circumscribing a large circle. The five cusps are filled with Tudor roses and the circle with a large portrait of Queen Elizabeth in full court dress. The quatre-foils under are filled by the arms of Elizabeth and Plymouth. Under this, the four lights are subdivided and filled with eight Elizabethan figures — all natives of Devon and Cornwall. First is most appropriately the renowned Sir Francis Drake, standing with the globe, allusive to his circumnavigation, and backed up by shipping of the period. The next figure is Drake's eminent contemporary, Sir John Hawkins, represented in partial armour. Sir Walter Raleigh, poet, statesman, courtier and soldier, comes next, and he is represented in the window richly dressed and holding a book, with the potato flower at his feet. At his side stands his half-brother, Sir Humphrey Gilbert, the great navigator, holding a mariner's compass. Sir John Hawley, the left-hand figure at the bottom, born at Dartmouth, was one of the great merchant princes of Elizabeth's time, distinguished for his public spirit, which led him to undertake many noble exploits for the country at his own charge. Near him stands the figure of Nicholas Hillyard, an Exeter worthy, who achieved fame as a portrait and miniature painter, as well as being jeweller and goldsmith to King James. The last two figures in the Elizabethan window are those of Richard Carew, the celebrated author of the survey of Cornwall, who was born at Antony in 1555, and the celebrated Sir Richard Grenville, whose gallant fight in the Revenge against fifty Spanish galleons is historic in British naval annals. In the Victorian window the tracery is similar in character to that already described. Her Majesty Queen Victoria occupies the large circle, with Imperial emblems in the five cusps, and the quatre-foils contain the arms of Cornwall and the late Alderman James. Of the eight Victorian figures, Sir Joshua Reynolds, the famous portrait painter, comes first, and next is that of Sir Humphrey Davy, the Cornish scientist who invented the miner's safety lamp. John Couch Adams, the distinguished astronomer, and Charles Kingsley, the author, occupy positions lower down, the figure of Kingsley being shown standing near Bideford Bridge. Naval and military heroes of the period are represented in the figures of Lord Exmouth, who distinguished himself in more than one sea fight in the early part of the century, and Colonel Chard, whose heroic defence of Rorke's Drift is still fresh in living memory. Grouped together at the bottom of the window are the figures of Richard Trevithick, the inventor of the locomotive, and Samuel Laylor Coleridge, the poet. Below the windows the Council have placed a brass tablet recording the circumstances of the gift.

Wharfedale (Yorks) Infectious Diseases Hospital Competition.—Twenty-six competitors sent in plans for the infectious diseases hospital which it is proposed to build for the Wharfedale Union. The plans signed "Anti-Microbe" (by Messrs. Blackwell and Thompson, of Leicester) have been accepted. They provide a hospital that is estimated to cost £12,940, and, if estimates can be secured for the execution of the various works at something like this figure, the Board will award Messrs. Blackwell and Thompson the first prize. Pending this result, the second prize has been withheld.

Keystones.

Public Baths and Halls at Kinning Park, Glasgow, which are proposed to be built, are estimated to cost £17,642.

New City Mortuary.—On Saturday last the Lord Mayor laid the foundation stone of the new buildings at the City Mortuary in Golden Lane.

A new Workhouse Infirmary at Warwick is to be erected by the Board of Guardians. The buildings will be in two blocks and are estimated to cost £9,000.

Building Collapse.—About six o'clock on Saturday morning a concrete flooring, 100ft. by 80ft., collapsed at a building in course of repair at 46, Worship Street, Finsbury, killing one man and injuring four others.

A New Fire Station at Edgware Road, N.W., is being built at an estimated cost of £13,210, in addition to £98 for stores. The site has cost £7,195 15s. 9d., and the station is expected to be completed by August, 1900.

The Queen's Theatre, Keighley, is being rearranged and enlarged at a cost of about £20,000. When completed, it will seat nearly 2,000 persons. There is a frontage of 86ft. to Queen Street and the total area of the site is about 7,000 square feet. Mr. Frank Matcham, of London, is the architect.

Sir Edward Poynter, P.R.A., has been presented with the honorary freedom and livery of the Worshipful Company of Turners "in recognition of his distinguished services to English art." With regard to the opening of art exhibitions on Sunday Sir Edward said: "Certainly, the best thing for the best day."

"The Luckie Horseshoe" which Mr. Harry Hems found at Exeter thirty-three years ago was celebrated again on December 9th at a dinner attended by nearly a hundred of the craftsmen employed at the firm's studios. Mr. Harry Hems himself presided and his eldest son, Mr. Greville C. Hems, took the vice-chair.

Sir John Donnelly has retired, after forty years' service as head of the Department of Science and Art at South Kensington. At the recent complimentary dinner which was given to him Sir John Gorst said that when Sir John took the reins of the science branch in 1859 the number of persons attending the classes was 395, and the payments were under £2,000. In 1897 the number of students under instruction was £197,796, and the grants were £169,000.

Overcrowding in Manchester. — The Sanitary Committee of the Manchester City Council have resolved to recommend the purchase by the corporation of an estate of 237½ acres at Higher Blackley, for the purpose of erecting workmen's dwellings, in order to relieve the overcrowded areas of the city. The chairman of the committee (Mr. Alderman Walton Smith) says that the utilisation of the land for this purpose will be a very gradual process. His view is that it shall be held as a reserve against future contingencies. Part of it might also be let out in allotment plots and gardens.

The City of London Corporation.—At their meeting last week it was referred to the Library Committee to make the necessary arrangements for an exhibition in the art gallery during the summer of 1901 of works chiefly by Velasquez and Fortuny, at an expense not exceeding £500, exclusive of insurance. On the recommendation of the City Lands and Improvements and Finance Joint Committee it was also agreed that the corporation should co-operate with the London County Council in the endeavour to secure the preservation, on account of its historic associations, of the house No. 17, Fleet Street (known as Cardinal Wolsey's Palace), and that a contribution of £2,500 should be made towards the purchase of the freehold, provided the building was not allowed to overhang the public way, but was set back to the general line of the street improvement, and that the decorated room on the first floor was preserved for the public benefit.

Accident at Dublin.—Whilst a large block of stone was being placed in position on a railway bridge in Dublin last Thursday, it overturned, killing one man and injuring three others.

King's School, Canterbury.—Last Friday the Primate laid the foundation stone of the buildings about to be erected for the extension of King's School, Canterbury, at a cost of about £4,000.

The Death of Mr. George Robinson Brock, at the advanced age of ninety, took place at St. Leonards-on-Sea last Wednesday. Mr. Brock was for many years attached to the Royal Engineer establishment at Chatham as Instructor in Architecture to officers of the Royal Engineers there.

The Edinburgh School of Applied Art.—The drawings, which are largely architectural in character, executed during the past year by the students of the School of Applied Art, of which Dr. Rowand Anderson is director, are at present on public exhibition in the galleries of the Royal Scottish Academy.

The Glasgow Master Wrights' Association held their quarterly meeting last Thursday, Mr. Alex. M'William, president, in the chair, when a lecture was delivered by Mr. James Chalmers, architect, on "The Mansions of Scotland." The secretary, Mr. James L. Selkirk, C.A., intimated that the directors were ready at all times to receive communications from members on matters relating to the interests of the association.

New Municipal Offices at Scarborough.—A Local Government Board inquiry was held at Scarborough last Friday relative to the application of the corporation for sanction to borrow £14,000 for the purpose of adapting the St. Nicholas Mansion, which stands on the newly-acquired St. Nicholas estate in the heart of the town, for municipal offices. At present the offices of the different departments are scattered, and the object is to concentrate them. There was no opposition.

Clergy and Artists' Association.—In consequence of differences of opinion at a meeting of the Clergy and Artists' Association, held at Leighton House on December 15th, the Bishop of Rochester, Sir William Richmond, R.A., Canon Gore, Canon Scott Holland, Mr. Henry Holiday, Mr. A. G. Walker, several members of the committee, including the Hon. Mabel de Grey, Miss Emily Ford, and the Rev. Percy Dearmer, and a considerable number of other members, have decided to resign their membership of the association. A provisional committee was formed after the meeting to take steps for constituting a new association with the same objects.

Peterborough Cathedral Restoration.—The process of "restoring" Peterborough Cathedral goes on apace. Part of the scaffolding around the unsurpassed west front has been removed only to be placed on the other side. The annual report of the Restoration Committee, which was issued on Saturday, showed that £2,925 had been expended this year, and that another £1,267 was needed to complete that portion of the scheme already in hand. There are additional parts of the edifice which need restoring, the cost of which is estimated at over £5,000. If this is raised, more than £130,000 will have been spent in restoring the cathedral during the past half-century.

The Central Society of French Architects has announced the results of their general election of officers as follows:—M. Alfred Normand, member of the Institute, president; MM. Duchatelet, Lalanne and Beignet, of Angers, vice-presidents; MM. Poupinel, principal secretary; L. George assistant secretary, and Gustave Olive, secretary; Boileau, recorder; Nizet, treasurer. MM. Bartaumieux, Daumet, member of the Institute, and Lucien Etienne, censors. MM. Daunay, Degeorge, Achille Hermant, Paul Sédille, Frantz Jourdain, Louis Bonnier and Paul Wallon, Parisian members of the Council. MM. A. Bellemain, of Lyon; L. Gillet, of Châlons-sur-Marne; E. Paugoy, of Marseille; and Loquet, of the Roche-sur-Yon, provincial members of the Council.

New Patents.

These patents are open to opposition until January 22nd.

1898.—Cement Kilns.—17,696. J. C. Swan, Newcastle-on-Tyne. When this kiln is started the slurry, for example, is run through tubes at the top into a continuation, below which is a water-jacketted extension connected with a gas producer or furnace. The mass is partly fritted and then falls down into a cooling chamber, whence it is withdrawn from time to time. Air is admitted under pressure to the furnace to raise the heat, and air is let into the cooling chamber to cool the clinker.

Automatic Lathes.—17,758. J. H. Weiss, London (*W. P. Preble, New York*). This invention consists of an automatic turning lathe which is provided with a chuck carriage mounted upon a reciprocating bed-plate, and so constructed as to present succeeding longitudinal portions of the material to the revolving cutter: mechanism for imparting a proportionate reciprocation to the chuck carriage laterally to the cutter and a continuous revolution to the material; and a cutter mounted on a carriage which is fixed to a bed-plate automatically operated to bring the cutter into and out of contact with the material to be cut. In lathes of this kind, when set, articles of any one pattern, such as knobs, buttons, balusters, &c., can be continuously produced.

Imitation Marble.—24,086. D. Laffan and C. J. Bury; both of Dublin. A glass sheet is first washed over with a solution composed of: resin, 1lb.; ammonia, 2oz., boiled with size and alum, 2oz.; and boiling water, 7 gallons. This prepares the surface. The colours are then thrown on with a brush, or broom, or otherwise, and a coating of white lead, 1lb.; terebine, ½ pint; and spirits of turpentine, ½ pint, is then put on, which brings up the colours. A thick coat of whiting and size is then applied, and afterwards a backing of Brunswick black or gas tar, which may be sprinkled over with sand to form a key for the plaster or cement.

Drying White Lead.—24,211. East Ferry Road Engineering Co., Limited, and others, London. Instead of spreading it in a thin layer over heated tables, the lead is spread on a series of supports mounted on a central shaft which is revolved. Hot air is admitted as required, and there are adjustable scrapers which can be brought into operation to scrape off the dried material. The whole of the working parts are enclosed and no poisonous dust can escape. It is stated that the drying is much more rapid than by the old method.

Pipe Cleaners.—26,097. G. F. Restall, London In one modification the brush is mounted on a screwed part of the rod or rope, so that when this is pulled backwards and forward, the brush, acting like a nut, rotates. By another method friction rollers are employed to work through bevel gearing and revolve the brush shaft.

Cutter Blocks.—27,107. A. A. Atkin, Birmingham. The block has a cylindrical body slotted longitudinally to receive the cutting irons, which are held by screws. Below the cutting edge of each is a mouth which collects and directs the shavings so that they do not fly all over the worker. It is claimed that by the use of these blocks a better finish is put on the work and there is less danger of personal injury.

Waterproofing Materials.—27,118. J. J. Ingham, Bradford. For waterproofing cloths or for forming roads or roofs, the following mixture (boiled together) is used:—Rock asphalte, 4 parts; bitumen, 2 parts; and 1 part each of Stockholm and Norwegian tar and Archangel pitch. Sand may be added.

1899.—Venetian Blind Fittings.—1,704. J. W. Stidolph, London, S.E. On the bottom lath are fixed shallow metal boxes, through the centre of which the blind cord passes and is tied in a knot. In the boxes are buckles by which the tapes are fastened, while each has a snap lid. When cleaning is done this invention is said to be much more simple than the untacking of the tapes by the present method.

Fireplaces.—13,263. H. W. Roberts, Newmarket. The fireplace is built of glazed bricks between the ordinary jambs of a chimney breast and becomes integral with the wall. The sides incline downwards and inwards, and the back consists of bricks laid slightly inclined to the horizontal and sloping towards the front. An ashpan is provided below the grate, but no metal pieces are required for fixing.

The following specifications were published on Saturday last, and are open to opposition until January 29th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—18,158, Weiss (*Preble*), lathes for turning or shaping wood and other materials. 24,501, Ellen, acetylene generators. 25,081, van Kannel, revolving doors. 25,275, Boult (*Carré*), fireproof paint or composition. 25,304, Haddan (*Rudolph Koepp & Co.*), process of manufacturing artificial stone. 25,730, Kossov Wisehew and Sofronow, safety locks for doors, &c. 25,943, Webb, method of protecting or packing glazed and other bricks, tiles, and other goods. 26,194, Herbert, machine for moulding spigot and socket pipes, flange pipes, &c. 27,156, Leslie, apparatus for consuming smoke and fumes in factory and other chimneys and economising the heat generated. 27,205, Duncan, incandescent burners and mantle supports. 27,228, Geipel and Lange, regulators for hot-water heating apparatus. 345, Simpson and British Non-Flammable Wood Co., Ltd., fireproof compositions for painting or covering the surfaces of wood or other materials.

1899.—458, Mendel, bolts for doors. 1,496, Whitehouse and Billings, oil-stone or hone case or box. 1,830, Fischer, windows. 1,925, Forrest, device for facilitating the teaching of drawing, sketching, &c 1,941, Hirst and Murphy, electric incandescent lamp pendants or brackets. 2,766, Welsby and Ward, guards and riving knives for use with circular saws. 2,921, Neill, manufacture of bricks. 2,938, Ward, kilns, ovens, or arrangements for drying stone and similar material. 3,072, Dalman, theatre and analogous chairs. 3,663, Biebuyck, closets. 7,139, Morgan, apparatus for closing doors, gates, casements, &c. 14,266, Mennell, Mennell and Walls, guard for circular saws and similar machinery. 17,406, Matthews, acetylene gas machines. 19,027, Wright, Jones, Robinson and Dunn, new method of forming ornamental terminals on hollow stair rods. 19,615, Ninnemann, water taps. 19,659, Boyd, air pump for testing soundness of chimneys, drains, &c. 19,700, Lake (*Healey*), machines for cleansing sewers or drain pipes. 20,917, Koringer and Lagus, means for raising and lowering windows. 21,035, Kellner, manufacture of acetylene gas.

COMING EVENTS.

Wednesday, December 20.

Provident Institution of Builders' Foremen and Clerks of Works.—Ordinary Meeting of members at 8 p.m.

Society of Arts.—Mr. H. Bloomfield Bare, F.R.I.B.A., on "Bi-manual Training by Blackboard Drawing." 8 p.m.

Trades' Training School, 155, Great Titchfield-street, E.C.—Presentation of prizes by Professor W. C. Unwin, F.R.S., at Carpenters' Hall, London Wall. 8 p.m.

Thursday, December 21.

Institution of Civil Engineers.—Students' Visit to the Generating Station of the Westminster Electricity Corporation, and also to the Works of the Shingleton Ice Company, Eccleston-place, S.W. 2 p.m.

Royal Aquarium.—Gas and Allied Trades Exhibition opens.

Friday, December 22.

Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.—Mr. Isaac Low on "Water Closets and their Connections." 8 p.m.

Saturday, December 23.

Dundee Institute of Architecture, Science, and Art.—Mr. Charles Soutar on "Some Local Cathedrals" 7 p.m.

New Companies.

Askam Brick Company, Limited.

This company was registered on December 8th, by V. Thomassett, 60, Watling Street, E.C., with a capital of £10,000 in £1 shares, to acquire any mines, minerals, quarries, stone, iron, metals, coal, and other substances or products, and to carry on the business of manufacturers of and dealers in bricks, tiles, pipes, terra-cotta, &c. The first directors (to number not less than three nor more than five) are H. Mellon, R. F. Mathews, G. S. Heath, and J. Field. Qualification, £300. Remuneration, £50 per annum, divisible. Registered office: The Brick Works, Askam-in-Furness.

Thomas Blezard, Sons and Co. (1899) Limited.

This company was registered on November 24th by Cartwright and Co., 60, Watling Street, E.C., with a capital of £15,000 in £1 shares, to acquire the business carried on at Greenbank Foundry, Padiham, Lancashire, to adopt an agreement with J. Wolstenholme, and to carry on the business of hot-water engineers, iron and brass founders, &c The first directors (to number not less than two nor more than seven) are to be appointed by the subscribers. Qualification, £100. Registered office: 6, St. Mary's Gate, Manchester.

Llanelly and District Electric Lighting and Traction Company, Limited.

This company was registered on November 29th, by H. J. Leslie, 15, Union Court, Liverpool, with a capital of £50,000 in £1 shares, to carry on the businesses of electricians and electrical engineers, producers and suppliers of electricity for the purposes of light, heat, or power; as manufacturers of and dealers in cables, lamps, and electrical plant and apparatus of every description; and also as manufacturers of and dealers in all kinds of chemicals; to erect and maintain destructors, and to deal with all kinds of refuse; to construct and maintain rail and tram roads, wharves, piers, docks, warehouses, and other buildings; as manufacturers of and dealers in mortar, artificial stone, dealers in coke, coals, wood, oil, clinker, and other articles of all kinds, &c. The first directors (of whom there shall be not less than two nor more than five) are to be elected by the signatories. Qualification, £100. Remuneration to be fixed by the company.

Talbot and Co., Limited.

This company was registered on December 1st, by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £10,000 in £1 shares, to acquire the business carried on by Frank Talbot, A. Talbot, and Alfred Talbot at Leeds under the style or firm of Talbot and Co., and to carry on the business of artists in stained-glass, embossers, etchers, gilders, iron, copper and other metal ventilator and casement manufacturers, &c. The first directors (to number not less than three nor more than fifteen) are to be appointed by the subscribers. Qualification, £250. Remuneration as fixed by the company. Registered office: Bowman Lane, Leeds.

Provincial Estates Company, Limited.

This company was registered on December 2nd, by R. Fitch and Co., 42, Furnival Street, E.C., with a capital of £20,000 in £10 shares, to adopt an agreement with John Hayhurst, to acquire and deal in real and personal property of all kinds, and to carry on the business of builders, contractors, decorators, &c.. The first directors (to number not less than three nor more than five) are J. Hayhurst, J. Parker, and C. H. Vesey. Qualification, £500. Remuneration as fixed by the company. Registered office: 29, York Street, Sheffield.

Societe Des Etablissements Voillereau et Pasquier, Limited.

This company was registered on December 5th, by H. B. Brandreth, 10, Union Court, E.C., with a capital of £24,000 in £4 shares, to adopt an agreement with A. Voillereau, E. Pasquier, and P. de Bacre, and to carry on the business of office and shop fitters, furniture manufacturers, &c. The first directors (to number not less than four nor more than seven) are to be appointed by the subscribers. Qualification, 100 shares. Remuneration, 20 per cent. of the net profits after 5 per cent. is paid.

Holton Estate Company, Limited.

This company was registered on December 6th, by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £5,000 in £10 shares, to acquire land, to erect dwelling-houses, shops, warehouses, and other buildings, and to carry on the business of builders, contractors, painters, &c. The first directors (to number not less than two nor more than four) are to be appointed by the subscribers. Qualification, £100. Remuneration as fixed by the company. Registered office: 4, Holton Road, Barry.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ALRESFORD (Hants).—For the erection of vagrant wards, laundry, &c., at the workhouse, for the Union Guardians. Mr. W. H. Hunt, architect, Alresford. Quantities by Mr. E R. Babbs, Hook, Surbiton:—

Mussellwhite & Son	£1,4 4 0 0	Boscomb	£1,098 0 0
Tucker	1,267 0 0	Eddotts, Alresford*	1,076 17 6

* Accepted.

BEXLEY (Kent).—For the erection of school buildings for the School Board. Mr. J. Ladds, architect, 7, Doughty-street, Mecklenburgh-square, London, W.C. Quantities by Mr. Alfred Boxall, 8, Adam-street, Adelphi, W.C.:—

T. D. Graty	£5,880	Garlick and Crutchfield	£5,530
Martin, Wells, and Co.	5,789	T. G. Sharpington	5,430
Pryer and Co.	5,613	J. Lonsdale, Swanley Junction*	5,227
Thomas and Edge	5,556		
West Bros.	5,552		

* Accepted subject to approval of the Education Department.

CHISWICK.—Accepted for the erection of two detached villas, Spencer-road, Chiswick. Messrs. Palgrave and Co., architects, 28, Victoria-street, Westminster:—

Mead and Burton, Chesham	£2,600

HARWICH.—For levelling, paving, &c, Stour-street, St. Nicholas, for the Town Council. Mr. Henry Ditcham, Borough Surveyor, 7, West-street, Harwich:—

Horan and Son	£1,318	Smith and Son, Witham (accepted)	£1,200
H. J. Stone	1,300		

[Surveyor's estimate, £1,186 3s. 4d.]

LONDON, E.C.—For the erection of new printing and publishing premises, Norwich-street, Fetter-lane, E.C. Mr. Alfred Conder, architect, Palace-chambers, 9, Bridge-street, Westminster. Quantities by Mr. E. J. Paine, 11, Great James-street, Bedford-row:—

John Greenwood	£10,726	Akers and Co.	£9,294
Harris and Wardrop	10,640	Stimpson and Co.	9,260
F. and F. J. Wood	10,400	E. Toms	8 919
Grover and Son	9,770	J. Appleby	8,790
L. H. and R. Roberts	9,387	Hy. Young*	8,693

* Accepted.

NORWICH.—For extensions to Isolation Hospital, Norwich. Mr. Arthur E. Collins, city architect:—

Warburton	£10,812 6 1	J. S. Smith	£11,174 5 11
Downing	11,948 0 0	J. Youngs, Norwich*	10,849 0 0
J. Hurn	11,070 0 0		
G. E. Hawes	11,500 0 0		

* Accepted.

Heating and Ventilation.

Bailey and Co., Parsonage-buildings, Manchester	£878

OTLEY (Yorks).—Accepted for the erection of seventeen houses, Jennett's-crescent, for the Leeds Industrial Co-operative Society, Limited. Messrs. Fairbank and Wall, architects, 3, Manor-square, Otley:—

Masonry.—Renwick and Son, Otley	£4,062 10
Joinery.—J. H. Dennison, Otley	
Plumbing.—E. Mawson, Otley	
Plastering.—Honroyd and Sons, Bradford	
Slating.—H. Thornton, Otley	
Painting.—Bennett and Son, Otley	

PARKSTONE (Dorset).—For the erection of club premises, Ashley-road, Upper Parkstone, for the Heatherlands Unionist Association. Mr. Walter Andrew, architect, Parkstone:—

T. C. Rigler	£1,150	A. and F. Wilson	£1,015
Burt and Nick	1,148	Baker and Pearcey, Parkstone*	945
W. J. Cross	1,140		
J. Hillman	1,118		

* Accepted.

SOUTHERNDOWN, Wales.—For rebuilding the "Dunraven Arms" Hotel. Messrs. Linton and Barker, architects, Westgate-chambers, Newport:—

Wm. Moore	£5,850	Richards and Evans	£5,497
D. J. Davies	5,821	D. Davies	5,420
D. L. Jones	5,758	Phillip Gaylard, Bridgend*	5,350
C. H. Reed	5,620		

* Accepted.

WOLVERTON.—For new additions to envelope works, for Messrs. McCorquodale and Co., Limited. Mr. H. Phelps Drew, architect, 33, King-street, Covent Garden, W.C.:—

Honour and Son	£2,049	T. P. Robinson, Wolverton*	£1,755
H. Martin	1,881		

* Accepted.

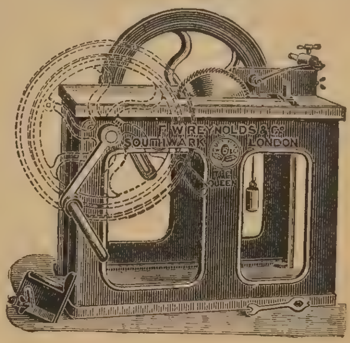
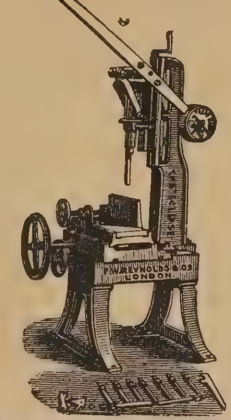
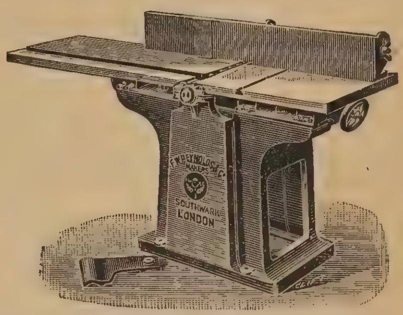
The Most Simple and Useful Hand-Bench in the Market.



THE "ECLIPSE" MORTISING MACHINE.



NEW PLANING AND TRYING MACHINE.



HALL'S - SANITARY - WASHABLE DISTEMPER

(PATENTED),

A NEW SANITARY WATER PAINT,

HAS great advantages, some of which are as follows:

It Sets Hard, Kills Vermin, and Disinfects.
It is Washable in 3 Weeks, Does not Scale, can be Painted or Varnished, and will Stand Inside or Outside.
It is made in Dark Rich Shades as well as in Light Tints, contains no Lead, and Does Not Turn Black.
It only requires the addition of Water to make it ready for use, so that anybody can apply it.
It is Cheaper, Cleaner, Healthier, and more Artistic than Wall Paper.

It is Sold by leading Chemists, Drysalters and Ironmongers, and Manufactured by
SISSONS BROTHERS AND CO. Limited, HULL,
From whom Samples, Shade Card, and other particulars can be obtained.

CONTRACTS OPEN.

TO BUILDERS.

VESTRY OF ST. JOHN, HAMPSTEAD.

The Vestry invite TENDERS for the ERECTION of a BRANCH PUBLIC LIBRARY at the corner of Westbere and Sarre Roads, West Hampstead.

Drawings and specification can be inspected, and bills of quantities and form of Tender obtained, on application at the Vestry Hall upon deposit of £1 1s., which will be returned if a bonâ-fide Tender be sent in by the day and time mentioned below, but will otherwise become forfeited to the Vestry.

The person or firm whose Tender is accepted will be required to enter into a written contract, and to provide two sureties for the due performance of the same. The expenses of contract and bond to be paid by the contractor.

Sealed Tenders, endorsed "Tender for West End Branch Library," to be delivered at my office by FOUR p.m., on THURSDAY, JANUARY 4th, 1900.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order,

ARTHUR P. JOHNSON,
Vestry Clerk.

Vestry Hall, Haverstock-hill, N.W.
December, 1899.

DIFFICULT FOUNDATIONS AND SUBSTRUCTURES.*

By H. NORMAN LEASK.

THE subject of difficult foundations and substructures is one which would meet with varied treatment at the hands of many experts, so, aware of the diversity of opinion, it is my intention to say little that is original, and to give examples founded on precedent and brought to successful issues by some of the chief architects and engineers of the day.

As is well known, foundations are the most essential portion of any structure that is reared above the earth's crust. It is therefore of paramount importance that they should be carefully considered when a structure has to be erected on a site of doubtful, unknown, or known evil reputation, more especially when the magnitude and use of the structure is such that it involves the public safety.

I would suggest that in the case of any structure the site should be carefully surveyed, both as to extent, contour, and stratification, either by trial borings or shafts—a piece of gunbarrel proving very useful, or, better still, the jet system of trial boring. The reasons for so doing are obvious and hardly need mention. In the first place, there is scarcely a more prolific source of extras than foundations; then again the method often pursued defeats its object, that is, in many cases, the buildings are laid out, the trenches excavated and inspected by the architect, who is either satisfied with the stratum found or orders additional depth to be made. In the case of a hard crust overlying a softer stratum of considerable thickness, if the hard crust is or may be penetrated so that merely a thin layer of it stands intact over the soft stratum, the structure is liable to bear through it, resulting, if not in loss of property, in the development of unsightly ruptures both internal and external to the structure. Another reason is the sense of security possessed when one is aware of the conditions that exist, permitting the necessary precautions to be taken in devising special means to the end in view, namely, the stability of the structure and economy in its erection.

Having said so much as to the best method of procedure before designing the foundations—or, for that matter, the structure itself—I will now draw your attention to what may be termed "difficult foundations." It is really not so much the difficulties encountered, as it is almost possible to erect a structure on any stratum and ensure its stability, but the doing so economically.

Difficulties are rare in Dublin, and are confined to isolated areas and riverside sites, and the nature of the soils in these areas is either alluvial deposits or made ground and running sand. But throughout the provinces, in Belfast, Dundalk, and Cork, varying conditions will be and have been met with, so I will touch on conditions and combinations that, to my knowledge, exist, and give a few of the most important and successful methods adopted elsewhere to ensure the stability of the structures reared on similar sites.

What are Difficult Foundations?

It may be asked what may be classed as difficult foundations? Well, in my opinion, they are of three distinct kinds, with combinations of all: first, natural difficulties, and second and thirdly artificial difficulties.

FIRST CLASS.—Natural difficulties arise out of the nature of the strata underlying the site for the proposed structure, such as quick or running sand, sand unconfined, sand with water, bog land, marsh, alluvial deposits of considerable depth, spongy wet clay needing draining, recently made ground, ground of unequal bearing power, such as part rock, or other incompressible material, and part clay.

SECOND CLASS.—Artificial difficulties. The nature and use of the building often requires special methods, even when the nature of the site under ordinary conditions would be deemed excellent for building upon.

THIRD CLASS.—The proximity of other buildings—their use and the nature of their construction, as well as the depth and nature of their foundations, where this latter is unknown—eccentrically loaded footings may be entailed, which are at any time objectionable. The use of piles may be precluded owing to the vibrations caused by driving them. The sinking for a basement or foundations may cause a hydrostatic or inclined pressure to be thrown on a wall never designed to receive such, and thus involve litigation and loss of money and time. As these difficulties are countless, it is only possible to touch on some of them here.

I will now draw your attention momentarily to the following table of the bearing power of earths, &c. It was compiled by Mr. A. T. Walmisley, M.I.C.E., and given in a paper on London foundations read before the R.I.B.A., in June, 1898.

	Lb. per Sq. Ft.		Lb. per Sq. Ft.
Alluvial deposits	1,000— 1,500	Ordinary sand and gravel	4,000— 5,000
Dry made ground	2,500— 3,500	Ordinary confined	8,000—12,000
Moist clay	2,000— 3,000	Ordinary rock	18,000
Dry compact clay	4,000— 5,000	Granite in Tower Bridge	32,000
Thick clay	6,000—10,000	Brick in Tower Bridge	26,000
Loose sand	2,000— 6,000	London Clay	8,000
Compact sand	4,000— 6,000	Safe limit for last	4,000
Confined sand	10,000—15,000		

If you work out the weights of some buildings and their contents you will find that even soils of high bearing powers will be overloaded when the structures are erected on them, unless special measures for the distribution of the weights are adopted.

As settlement is commonly to be expected in some soils, and unequal settlement is to be avoided, we must therefore proportion as exactly as possible the area of the footings supporting the various loads that have to be taken up. I will now turn to the various methods at the disposal of the engineer or architect with which to overcome the difficulties.

Piling.

Piles are the means most frequently adopted in this country when the nature of the soil is such as needs consolidation, or where the structure has to be supported almost entirely independent of the immediately underlying strata. Piles are of two kinds—bearing and resistance piles. The first are driven to a hard underlying strata capable of sustaining the imposed load, and act as pillars, being greatly assisted by the sustaining power of the surrounding material. It may be assumed that the ultimate strength of the pile is the crushing strength of the timber, or iron, whichever is employed.

The sustaining power of resistance piles—that is, those driven to a given resistance, and sustained by the friction against their sides of the material through which they pass—is ascertained either by experience in the same soils, or by using a formula which will give results approximate to those found in practice. Of formulas for this purpose there are many, but perhaps that evolved lately in America is, I believe, one of the best. I will mention it here, as it is the one on which the New York building authorities base their calculations, and is enforced in their by-laws. It is known as the "Engineering News" formula, and is stated thus:—Twice the weight of hammer in tons multiplied by the fall in feet, divided by the average penetration during the last few blows in inches, plus one a constant to provide for the increased resistance to moving at the moment of impact, which reduces the formula to $P=\frac{f\times w\times h}{S+C}$ where P = the safe bearing resistance, f a factor varying from 2 to 1, and recommended to be taken at 2, giving a factor of safety of 6. W = weight of hammer in tons, S = penetration in inches, C = the constant.

Experiment nevertheless is the safest guide, and it ought to be remembered that it is not right to simply drive one pile and then load it till it settles, but that several piles should be driven at their proposed distances apart and then some of them cut off below the platform on which the test load is to be erected. The reason for this is apparent: the driving of adjacent piles consolidates the material and greatly adds to the sustaining power of each pile. Patton in his work on foundations recommends the above practice.

The sinking of iron screw piles is accelerated by means of a jet of water under pressure, but they are little used in land structures, though advantageous for bridge piers, foundations for lighthouses, promenade piers, &c.

Screw piles have not to my knowledge been used in any land structures, but sand piles have been used, and will continue to be used, as they are very reliable. Sand piles are inserted by first driving a timber pile and withdrawing it and filling the hole so formed with sand—this can only be executed in certain soils which retain the impression made by the dummy for a sufficient period to allow the sand to be inserted. The

Drawbacks to Timber Piles

are first, that they can only be used in wet situations and they must be cut off below the lowest water-line level, thus necessitating in many cases deep excavation through treacherous soils, that need heavy timbering in order to prevent flowing, and requiring in all cases pumping to keep the bottom of the trench dry while the concrete is being placed in position. Then timber piles have the tendency to splinter, or become badly shaken, during driving; also to broom at the point, though this is not so liable to occur when square timber is used shod, as with round timber, such as is mostly used in this country.

Piles often suffer by being over-driven. It is better to put up with a moderate penetration, and a consequent lighter imposed load, than to drive on relentlessly, as is often done. The driving of dummy piles, and other scamping tricks, are less liable to be practised if the contractor is dealt fairly with in this matter.

Iron piles should always have a wide diameter both of pipe and screw, and a low pitch, and should be filled with good cement concrete when in position.

Sand piles are free from the great drawback possessed by timber, namely, to rot or be attacked by insects. A device somewhat similar to sand piling has been used by one of the contractors for the Paris Exhibition, who has consolidated soft soil by stamping with specially devised hammers, using a binding material, such as sand or ashes; the result is stated to be entirely satisfactory. I need not explain the way in which piles are driven or the difficulties encountered in so doing (for such is the domain of the contractor), or how they are treated when finished; but I may say that it is considered better practice to place caps and sills on them rather than to omit these, which, I fear is the more common practice.

The use of piles is commonest in Belfast, Dundalk, and Cork, as far as Ireland is concerned.

Where the soil is chiefly alluvial or made ground, a less expensive method might be adopted by forming a raft of concrete reinforced by means of iron or steel beams, which can be disposed in isolated situations or cover the whole area; for often sufficient piles cannot be driven inside the prescribed space at allowable distances apart, without overloading them. The compression of the surrounding material making it almost impossible to drive the required number.

---

* A paper read at Dublin on December 5th before the Architectural Association of Ireland.

Settlement

cannot be altogether avoided unless solid rock is reached, but unequal settlement can be provided against, only, however, by proportioning the area of the footings to the bearing power of the soil in hand consistent with the weights imposed. This often entails great spread of footing, and necessitates loss of space, considerable excavation and loss of material, owing to the necessity of offsets or footing courses. This can be avoided by the use of steel or iron beams acting as cantilevers spaced and dimensioned accordingly, and is only an improvement on the use of timber for extending the footings (in wet ground) either by using layers of thin timbers, or half timbers, placed transversely to each other.

The bearing power of the soil being ascertained, the requisite spread of the foundation arrived at, and the foundations figured out, a layer of concrete from 9in. to 2ft., according to the spacing of the beams, is laid in the trenches, and on this are laid the beams, either transversely or longitudinally. If longitudinally, the underlying layer of concrete may be thinner, and a second layer of beams must be placed transversely immediately over the first set. As each layer is put in, the beams are surrounded with concrete properly rammed between the joists, and on this platform the neat wall may be started. It will be seen at once that there is here an economy both in space and material.

Again, if isolated footings are found to be undesirable, the entire site may be covered with a layer of concrete and the same method pursued, only in this case it is necessary that there should be two layers of joists, and that when their lengths exceed marketable dimensions they should be spliced, both webs and flanges, at all joinings. This method, known as the grille or raft method, will be found to compare favourably with other methods in respect to their stability and economy. The use of beams very useful in transmitting heavy concentrated loads to materials of an inferior crushing strength.

There is yet the time-honoured method of sinking isolated piers to the hard strata, or erecting them on piles, and either springing arches from pier to pier on which the walls can be built, or spanning from pier to pier with a concrete and iron bressummer or iron girders and starting the structure from these. Piers have been built on clusters of piles and the entire site covered by a system of concrete groining, forming a platform on which to rear the structure; this is notably shown at the new ferry house at San Francisco, California.

These systems have their disadvantages, particularly in the case of arches, when provision has to be made to take up their thrust; neither can they be carried out in many soils.

The sinking of piers either of concrete, masonry, or brick through great depths of unstable material leads to the use of

The Pneumatic Method

of sinking cylinders. Hitherto this method was only applied to bridge structures, and was set aside by the use of open cylinders either of timber, iron, or brick, excavated by a grab dredge; but when in water-bearing strata, or when the soil was inclined to flow, it did so, and often endangered the adjoining structures as much as an open excavation would, and so the pneumatic process became indispensable when it was desired to reach an unyielding strata without endangering adjoining buildings. To quote Mr. Patton on the subject:—

"The entire question heretofore of applying this method to ordinary buildings has been one of actual and relative rapidity and cost of construction. If these difficulties can be removed there can be no question of the advisability of adopting this method for all important buildings, even if the necessity, from a practical point of view, does not require it—certainly when rock is at no very great depth below the surface, as the feeling of perfect safety as well as the demand for it will justify the increased cost, provided it is not too large a percentage of the entire cost of the structure.

"As buildings become more costly, the smaller will be the percentage of the cost for the foundations, and the greater is the reason—purely from a selfish or economic point of view—for making the foundations absolutely safe and secure, to say nothing of the greater danger to the comfort as well as the lives of the occupants, which imposes a far larger responsibility on the builders."

You will see, therefore, that the pneumatic method is to be advocated, especially when the building is important and the site unsafe; when open excavation is precluded, from its impossibility or disastrous effects; or when piling would either affect the adjacent structures, or enough piles could not be driven to carry the imposed load.

I will now give a short description of a pneumatic caisson. This is essentially an iron cylinder (though it may be rectangular in plan, and constructed of cast, wrought iron or timber), with a working chamber having a cutting edge and an air lock. It is worked on the principle of a diving bell, the pressure in the working chamber being a little in excess of the hydrostatic pressure at the depth under the surface at which the caisson may happen to be, and is kept up by means of air compressers and regulated by valves. The air lock is the means of exit and entrance both for materials and men, and is made as small as possible for the same reason as a lock is on a canal.

The door by which it is entered opens inwards, and the door from it to the working chamber opens inwards to the latter. When necessary, owing to the entrance of water or inflow of material, these doors are closed and the chamber slowly filled with air until the desired pressure is reached. On entering you step into the air lock and close the entrance door, the exit door to the working chamber being kept closed by the excess of pressure in the working chamber over that of the atmosphere. Compressed air is then admitted into the air lock which closes the door, and on the pressure in the lock equalling that of the chamber the internal door can be opened and the chamber entered. Egress of men or material is accomplished by reversing the process in the air lock; and so the work proceeds, the caisson sinking as the material is excavated either by its own or a superimposed weight, it not being wise to decrease the pressure, which would have a similar effect, butwould probably result in an inflow of material.

Sinking caissons is often accelerated by the use of hydraulic jets with their orafices distributed over the external surface, the water in forcing its way through the material acting as a lubricant and diminishing the skin resistance. When the nature of the material through which it is passing permits of it, it is often ejected from the working chamber to the surrounding site by means of a hydraulic ejector, but this can seldom be carried out on a building site as it would flood it in a very short time.

The objections to this system are, cost and difficulty of procuring men to undergo the increased pressure to which they may be subjected, as on entering a caisson one experiences a sharp pain in the region of the ears known as blocking, owing to the unequal pressure on the drum of that organ. This passes away on the pressure equalizing, and by a little precaution may be almost entirely avoided; but on the whole it tends to produce deafness. A greater source of danger is that of reducing the pressure in the air-lock too rapidly, which in some cases has resulted in death or paralysis.

When the caisson has been sunk to the desired strata it is usually filled with concrete or brickwork, on which stone templates, with distributing girders, are placed to take the concentrated loads.

There are other methods of sinking for piers in water-bearing strata, notably that known as the

Poetsch Freezing Process,

which, I believe, was conceived on the Continent and is adopted in America. In order to excavate in such strata the site of the proposed pier is surrounded by a series of tubes of fair diameter, sunk to the bed rock. In these tubes are inserted a flow and return pipe, and all are then connected up in series with a refrigerating plant, and a freezing mixture is pumped through them until the material is frozen. Excavation is then started and carried to the required depth, and the shaft thus sunk is filled with concrete or brick, the pipes being then withdrawn and the process repeated with individual piers. This method has been successfully carried out, but is necessarily expensive owing to the plant and chemicals used.

There is another method of dealing with water-bearing strata, the patent of Mr. R. L. Harris, N.Y., A.M.Soc. Engs., which, with the last process, is fully described in Mr. Patton's work on foundations. It is essentially a method of grouting the strata with liquid cement, and so either building a wall or covering the site with a block of concrete. It is also carried out by sinking tubes to the desired depth, through which the liquid cement is forced and escapes through holes in the surface of the tube, thus permeating the adjacent strata within certain limits ascertained by experience; as the tubes are gradually raised, they form stratas of concrete behind them.

I will now give you some

Examples taken from Actual Practice.

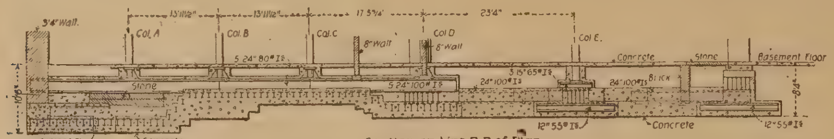
They are chiefly taken from American practice, and the drawings and data are taken, with apologies, from "The Engineering Record," an organ of the engineering and building trades in America. The only excuse I have for so doing is that in America difficult foundations are more commonplace, owing to the vast areas of difficult ground that have to be dealt with; besides the loads are greater in that country than any that have been attempted on this side of the Atlantic, with the exception of engineering structures. The Americans therefore have more experience, and, we may take it, adopt the best means ascertained from continued practice.

The first example, shown in the illustrations on p. clvi, is that of the Singer Building, New York, designed for the Singer Sewing Machine Co. by Mr. Ernest Flagg, architect, New York. It is of the ordinary construction common in this country, that is, brick walls and interior columns, the walls carrying their own weight and their share of the floors and roof with their live loads to their footings. The weight of the building and its contents was such that more than ordinary measures had to be taken in distributing the load over the stratum on which it was built, which was liable to flow when saturated. As will be noticed on the plan the walls adjacent to existing structures had to be placed eccentric to the foundation, which had such an offset as to require special treatment to avoid its canting under the imposed load. This was avoided by embedding in the footing parallel to the wall a number of rolled steel joists, and superimposed on these and let into the wall at one end, was another system of beams, from which they converge to the base plates of the interior columns and are fixed in that position by the weight on the column transmitted to them by means of distributing girders. This object is accomplished at the angles of the building in a similar way, by carrying the reaction girders across the angle under the exterior wall.

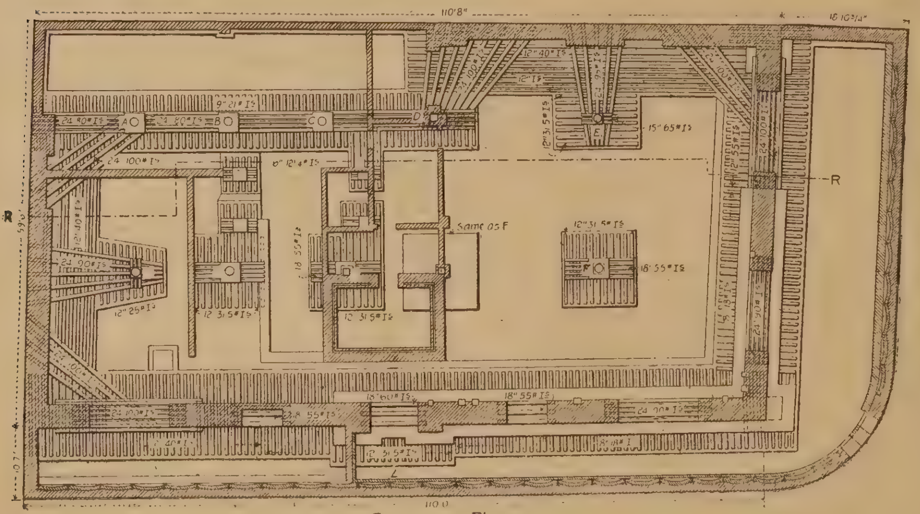
Along one wall, where the footing is 13ft. wide for one portion of its length, the concrete is reinforced by 12in. I-beams, at about 12in. centres, and placed transversely to the wall, which starts from this platform without offsets to the brickwork. The remaining portion is reinforced by 8in. I-beams, at about 12in. centres, but in this case the wall is offsetted to double its width, the walls being about 40½in. thick at their bases. In the case of openings in the basement walls, the foundations are carried through and the openings have sills composed of rolled beams on which templates are laid and the jambs started on them. In all cases the series of imposed beams are in direct contact with each other.

I will now turn to an example which is nearer home, being located near Rings End basin, at the point of the south line of quays, Dublin. It is a four-storey warehouse and basement and will be heavily stocked. The engineer, Mr. R. H. Leask, M.I.C.E., of Ireland, owing to the fact that the soil was made ground, under-laid at a depth of about 20ft. by a bed of gravel, the original bed of the river Liffey, decided to proportion the footings so as to exert a pressure of not more than one ton to the foot super; this required fairly extended footings; so in order to economise space and excavation he decided to make use of steel beams. The opportunity of purchasing tram rails of girder pattern and old style being afforded to him, as the D. U. Tramway Co. were relaying their roads at the time, he so designed the footings as to make use of these rails, as they were to be had at a much lower figure than market sections suitable for the purpose.

The main walls rest on the footings without offset. A bed of concrete, 12in. thick, was laid in the trenches, which varied from 7ft. 3in. wide to 5ft. 6in., on which were laid transversely at 2ft. intervals sections of old sleeper rail from 4ft. 6in. to 5ft. 6in. long, these being flushed up with concrete and the wall started on a further footing of concrete.



Section on Line R-R of Plan.



Foundation Plan.

SUBSTRUCTURE WORK IN THE SINGER BUILDING, NEW YORK. ERNEST FLAGG, ARCHITECT.

In the case of column foundations a layer of concrete, 5ft. 6in. wide and 12in. thick, was laid the entire length of the building, and on it were laid transversely a similar series of beams to the main walls. On these were laid a pair of continuous girder-type tram rails at centres 2ft. 2in. apart. The rails were about 80lb. to the yard, fully fished; and on these, under the columns, spaced at 9ft. centres, are placed three rails, each of which carries about 75 tons, which act as distributors. The piers between the openings were similarly treated. The building is now complete in every detail, and has fully justified the engineer's confidence in the method employed.

As another example I may take a San Francisco building known as Spreckles Building, which is of modern design—that is, of steel cage construction. Messrs. Reid Bros., of San Francisco, were the architects. The nature of the soil on which it was erected is of dense, wet sand, and the building is about 75ft. square; but, in order to reduce the unit pressure to about 4,500lb., it was necessary to extend the supporting medium to about 100ft. square. This was accomplished by first covering the entire site with a layer of concrete 2ft. thick, and on this placing a system of 15in. I-beams (fifty-eight in number) running the entire length, and properly web and flange spliced, and then ramming concrete between and around them. On top of this was placed another system, at right angles to the one below, of 15in. I-beams (sixty-three in number), and similarly spliced, this being again flushed up with concrete. The wall and floor columns were then placed on groups of distributing girders, generally six in number, and 20in deep, placed transversely to the last system, and the columns were then anchored to the girders in the bottom layer, thus ensuring the stability of the structure on its foundation.

My fourth example is that of the foundation to the Manhattan Life Building, New York, of which Messrs. Kimball and Thompson and Mr. C. O. Brown were respectively the architects and engineer. The site was in this case extremely difficult to treat, the substratum being sand and earth with water; and the adjacent structures were much older buildings and their foundations were not carried to the bed rock, which was at a depth of 56ft. from the pavement level. The total weight of the building and its contents would have imposed a load of 7,300lb. per square foot of the area of the lot. Piles could not have been used, as when driven at the regulation spacing of 30in. centre to centre there would have been 1,323 piles, and each would have had to carry something over 45,000lb., which exceeded the limit of 40,000lb. permitted by the authorities of the city. Other means had therefore to be adopted, and, on the recommendation of some eminent engineers, the pneumatic process was used for the first time in a building.

The site was first excavated to the level of the footings of the adjoining buildings, these buildings having being shored up previously, and new concrete footings inserted and the structure underpinned by a patent process of carrying the wall on wrought or cast-iron pipes driven to the back by hydraulic means and afterwards filled with concrete and duly wedged up to reaction beams in the old walls. The caissons were then sunk within 12in. of the old wall line, and so great was the pressure on them that in sinking they were somewhat distorted; after they had reached the rock they were filled with concrete and a brick pier carried up to the bottom of the excavation. These caissons were so placed as to carry very heavy cantilever girders, which carried the interior and wall columns and transmitted their load to the pier by means of steel bolsters resting on a grillage. By this means the weight on the wall and internal columns was transferred to the centre of the caissons, or nearly so, thus avoiding ugly encentric loads. The cantilever girders were about 63ft. long and weighed eighty tons, each having four webs and being 3ft. 4in. wide on the top flange. Of course, this is an unusual case, but many less aggravated cases are similarly treated with evident success.

The most unique example I have to refer to is that of a Birmingham foundation. A valuable site was for many years left vacant owing to the fact that it was obliquely intersected by the Great Western Railway tunnel, and several efforts were made to build on it, but as the authorities would not allow any weight on the arches of the tunnel, which was within 3ft. of the surface, the attempts fell through. At last, however, an architect (Mr. Ralph Heaton) was found courageous enough to adopt a novel method, and in doing so he did not fall short of the courage of our cousins across the Atlantic.

The entire structure was carried on a series of cantilevers of large proportions which rested on piers built close to the wall of the tunnel, the cantilever end projecting over the tunnel to the face line of the building, and the near end resting on and being anchored to another pier. The amount of counter-balancing load was about 160 tons in the case of one of the cantilevers.

Amongst many others worthy of mention is the case of a foundation to a monolithic concrete structure four stories high, walls 16in. thick at base, built on marshy ground, on which a pressure of 2,000lb. per foot super is exerted, which has been treated in a novel manner by a combination of light iron rods and concrete, the rods being ¾in. square and twisted, laid at 6in. centres and being 10ft. long. The total depth of concrete was 18in. and sloped off to 6in. thick at the extreme edge. I might suggest that expanded metal be used in preference to twisted square rods. I think it would be more economical, and serve the purpose as well as it does in concrete floors.

Electricity Power at Salford for lighting purposes and to supply motor-power for tramcars formed the subject of a Local Government Board inquiry last week into the application of the Town Council to borrow £400,000. Nearly £100,000 has already been spent in erecting plant, but a new generating station of 10,000 horse-power will be required.

At the New Balintober Infants' School, Campbeltown, now in course of erection (Mr. H. E. Clifford, of Glasgow, architect), a carefully-planned system of ventilation is being carried out by means of Cousland's improved Climax patent "Natural Exhaust" ventilators, supplied by the Climax Ventilating and Heating Co., Ltd., 93, Hope Street, Glasgow.

Society of Engineers.—At the forty-sixth annual general meeting of this society, held on December 11th, Mr. John Corry Fell, the president, in the chair, the following gentlemen were duly elected by ballot as the Council and officers for 1900: As president, Mr. Henry O'Connor; as vice-presidents, Messrs. Charles Mason, Percy Griffith and James Patten Barber; as ordinary members of Council, Messrs. Joseph Bernays, D. B. Butler, G. A. Pryce Cuxson, W. H. Holttum, R. St. George Moore, Nicholas J. West, Joseph William Wilson and Maurice Wilson; as hon. secretary and treasurer, Mr. George Burt; as hon. auditor, Mr. Samuel Wood, F.C.A. Mr. Fell announced that the following premiums had been awarded by the Council for papers read during the past session: The president's gold medal to Mr. E. Wynter Wagstaff, for his paper on "The Shan Hill Country and the Mandalay Railway;" the Bessemer premium to Mr. R. G. Allanson-Winn, for his paper on "Foreshore Protection, with special reference to the Case System of Groyning;" a Society's premium to Mr. Gordon Harris, for his paper on "Water Supply to Country Mansions and Estates;" and a Society's premium to Mr. Ewart C. Amos, for his paper on "Machine Tools."

Masters and Men.

The Perth Master Blacksmiths have decided to make a substantial increase on the price of all kinds of work done, in consequence of the increase in cost of iron by about 45 per cent, the price of coal by about 30 per cent., and through wages having advanced by about the same amount. It is proposed to shortly form an Association for the purpose of regulating the prices all over Perthshire.

Workmen's Compensation Case.—At Birmingham County Court last Wednesday, before his Honour Judge Whitehorn, an application was made under the Workmen's Compensation Act. In May last a labourer named Edwards was awarded 10s. per week compensation in respect of an injury received while in the employment of Mr. Perrell, builder and contractor. The application now was to terminate the payments, inasmuch as Mr. Perrell had offered Edwards £1 per week as a painter's labourer. The situation, however, was refused. The medical evidence showed that the man was capable of doing such light work as he was offered, but Edwards said he had been a master baker, had only entered the applicant's employment temporarily, and did not want to be a labourer again. He was now selling patent wicks for lamps, and making a profit of about 8s. per week. His Honour decided that the present pay should not be continued.

The December Report of the Amalgamated Society of Carpenters and Joiners shows that in some quarters there has been unfavourable comment upon the apathy of the leading trades unions in contributing either to local or national war funds, and it has been urged that a general levy among trades unionists should be resorted to. Some branches of the Amalgamated Society of Carpenters are in favour of such a levy, as well as of providing for the support of the families of those of their members who are engaged in the war. It appears that the utmost that the 610,000 amalgamated carpenters can do, according to their rules, is to keep all Army Reserve men who are at "the front" in benefit without their being responsible for subscriptions, and the executive finds it necessary to point out that a levy can only be imposed upon members for "trade purposes." This represents the attitude of other trade unions, whose officials, however, urge their members to make individual efforts to augment all funds being raised for the relief of those who may suffer by the war.

Leicester Building Disputes. — At the annual dinner of the Leicester Master Builders' Association, Mr. Porter, president of the Derby association, said in labour disputes it was much better to struggle, even if they lost. They could not let the men have everything their own way; they must fight them. There would be a repetition of the recent struggle with the plasterers and they must be prepared for it. Mr. Arthur Chambers, president of the Leicester association, who was in the chair, in referring to the struggle with the bricklayers' labourers, said that after having passed through such a very severe struggle, which extended over a period of twenty-six weeks, the Association had held its own, and they were almost prepared to say they had had the best of it. Had their members all been loyal they would possibly have given a better account of themselves, but it was a time when several members thought fit to secede from the association. He did not blame them; they had difficulties of their own, and they were to be congratulated on having kept with the Association so long. He was pleased to say that nearly the whole of the seceding firms would pay the fines imposed, and would in a short time be reinstated with the association.

St. John's Schools, Banbury, are being varmed and ventilated by means of Shorand's patent Manchester grates, patent xhaust roof ventilators, and special inlet ubes, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Surveying and Sanitary Notes.

Mr. Ernest S. Gale, of Falcon Court, 32, Fleet Street, E.C., has been appointed by the Benchers surveyor to the Honourable Society of Gray's Inn.

Clearing Snow for Two Days.—The clearing of the snow from the principal thoroughfares in Leeds during two days last week has cost the Corporation £800. Nearly 5,000 loads have been removed.

Street Paving in Leeds.—Since June last the Leeds Corporation Highways Committee have completed the paving and flagging of eighty-five streets in connection with new estates in various parts of the city, and they have now in hand 163 new thoroughfares. Tenders have been accepted for the paving and flagging of a number of new streets in the districts of Headingley and Holbeck, and the request of the Hunslet Board of Guardians for wood pavement to be put down in front of the Union offices in Glasshouse Street has been granted.

Improvements at Morecambe.—At a recent meeting of the Morecambe Urban District Council the tenders for two of the three sections of the sewerage scheme (estimated to cost £63,000) were considered and remitted to Mr. H. B. Nichols, the consulting engineer, for him to report further. Plans for fifty new houses and for several new streets were passed. The Council was occupied in committee in letting the contracts for the construction of thirty-five new streets at the east and west ends of the town. The Local Government Board wrote sanctioning the loan of £5,000 for a refuse destructor, and the Council resolved to borrow the money at once from the Public Works Loan Board.

A Road Surveyor Fined for Negligence.—Richard Thorton, surveyor to the Drighlington District Council, was recently summoned at the West Riding Court for leaving stones on the highway, to the public danger. It appeared that the defendant had deposited a quantity of broken limestone in a rough state on the Whiteley Road at Drighlington. Only one side of the thoroughfare had been repaired in this manner; the place was left unprotected at night, either by light or otherwise, and the stone had been so irregularly distributed that one side of the road varied from 3in. to 15in. above the level of the other side.—The defendant stated that he had been surveyor since April last, and that he had been connected with the Local Authority for nineteen years. He was not aware that it was necessary to protect roads left in the state complained of.—The Chairman expressed much astonishment at the view.—The defendant was fined £1 and costs.

Institute of Sanitary Engineers.—At a general meeting held on December 13th, the following officers were elected for the year 1900:—President: R. Reynolds Rowe, F.R.I.B.A., &c.; vice-presidents: S. I. Adams (Southend-on-Sea), H. M. Dove (London), J. Farley (Hertford), S. Minty (Bournemouth), W. J. Wells (Reigate), and D. B. Wilkinson (Oldham); council: J. Allan (London), H. M. Apps (Maidstone), F. P. Barber (Rubery, Worcs.), H. G. Beams (Ewell), C. E. Butcher (London), G. H. Carter (London), E. D. Cecil (London), T. W. Deadman (St. Margaret's-on-Thames), Lieut.-Colonel Dixon (Sutton, Surrey), C. Dobbs (Sydenham), J. T. Griffin (Chingford), R. Horton (Chelsea), N. W. Hoskins (New Eltham), W. E. Markham (London), F. W. Mason (Enfield), T. R. Nash (London), E. R. Palmer (Beckenham), F. J. Rayner (Newhaven), W. Strachan (Hemel Hempstead), T. M. Taylor (London), J. Thompson (Southend-on-Sea), and E. H. Wheeler (East Molesey); auditor: R. J. Ward (London); directors: J. W. Wells, and H. M. Dove.

Builders' Notes.

London County Council.—At the meeting of the Council held on December 12th, the Finance Committee presented a return showing that the total debt of London secured on the rates was now £43,349,646, involving a charge on the rates of £2,710,583, of which £1,197,357 was interest and £1,513,226 repayment. Alderman Beachcroft remarked that the debt of London had increased by ten and three-quarter millions during the past six years. The municipal debt of the country had since 1876 been augmented by 140 millions. It was decided to promote the following Bills in Parliament next Session: The General Powers Bill, the Improvements Bill, two tramway Bills, the Spitalfields Market Acquisition Bill, the Rotherhithe and Ratcliff Tunnel Bill, a gas testing Bill dealing with the areas supplied by the Gas Light and Coke, Commercial Gas, and South Metropolitan Gas Companies, the London Water (Purchase) Bill, and the London Water (Welsh Supply) Bill. Details of these Bills will be found on page cxli of the supplement to the BUILDERS' JOURNAL for December 6th last. Mr. Beachcroft called attention to the fact that if the Bills were accepted by Parliament they would commit the Council to an expenditure of no less than £66,250,000, or if they added the light railway and clearance schemes, and the £3,000,000 for drainage, their total liability would be no less than £70,000,000. After much discussion it was decided that Tudor House, in Bromley Recreation Ground, known as "Rutty's House," should be pulled down.

Value of Strand Property.—On December 12th, Mr. Troutbeck and a special jury heard the case of *Hesse* v. *The London County Council*, a claim for compensation in respect of the freehold interest in the premises, 294, Strand, and 34 and 34a, Holywell Street, which will shortly be demolished in order to widen the Strand between St. Clement Danes and St. Mary-le-Strand. The premises in the Strand were let to the Aerated Bread Company, Limited, at £150 a year, and those in Holywell Street to Mr. Gilbert Noble, bookseller, for £150 a year. Alderman Samuel Green (Messrs. Green and Sons) stated that there was a term of eight years unexpired from June, 1898, at this rent, and, capitalising it at six and three-quarter years' purchase, his figure for the present value of the premises was £2,025. The premises would have to be rebuilt at the expiration of the leases and would then command a ground-rent of £301 per annum, which he capitalised on the 3½ per cent. tables (21·7 years' purchase), £6,532. With the addition of the customary 10 per cent. for compulsory sale, his total valuation amounted to £9,412. Alderman Sir John Whittaker Ellis (Farebrother, Ellis and Co.), Mr. Edward Holroyd Bousfield (Fox and Bousfield), and Mr. F. Green (Green and Sons) also gave expert evidence in support of the claim. On behalf of the London County Council, Mr. Edward Boyle called Mr. G. A. Wilkinson, Mr. James Green (Weatherall and Green), and Mr. Howard Martin (Thurgood and Martin), whose valuations ranged from £5,933 to £5,974, including the usual allowance of 10 per cent. for compulsory sale. It was stated that the premises were in the last stage of decay and that the Holywell Street portion was built more than three hundred years ago. After viewing the property the jury assessed the compensation at £6,500, inclusive of the customary allowance for compulsory sale.

Institute of Sanitary Engineers.—At a recent meeting of the Election Committee of this Institute the following were elected. As Members: A. F. Stilwell (Rochford), A. H. Scott (Southend-on-Sea), W. Strachan (Hemel Hempstead), J. F. Davidson (Willington Quay) and J. Ashton (Ormskirk). As Associates: G. F. M. Merriman (Worcester Park), T. M. Taylor (London), J. Holt (Rose Grove) and F. G. Edwards (Highbury).

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
		BUILDING—		
Dec.	22	Ben Rhydding, Yorks.—Additions, &c., to the Ben Rhydding Hydro.	The Ben Rhydding Hydro. Co.	Isitt, Adkin and Hill, Prudential-buildings, Bradford.
,,	22	Bootle, Lancs.—Fire Station	Corporation	J. H. Farmer, Town Clerk, Bootle.
,,	22	Manchester—Pulling Down Buildings	Joint Workhouse Committee	A. J. Murgatroyd, 23, Strutt-street, Manchester.
,,	23	Barry, Wales—School Board Offices	Barry School Board	G. Thomas, F.S.I., Queen's-chambers, Cardiff.
,,	23	Halifax—Semi-detached Villas	....	R. Horsfall and Son, 22A, Commercial-street, Halifax.
,,	23	Rawmarsh—School	School Board	J. Platts, Old Bank-buildings, High-street, Rotherham.
,,	23	Whitby—Shelter Seats	Urban District Council	T. K Scott, Flowergate, Whitby.
,,	23	Whitby—Shelter near Coastguard Station	Urban District Council	T. K. Scott, Flowergate, Whitby.
,,	23	Cardiff—New Wards at Workhouse	Guardians	E. Seward, Architect, Queen's-chambers, Cardiff.
,,	23	Ovenden, Yorks.—House and Stable	....	Jackson and Fox, 7, Rawson-street, Halifax.
,,	23	Rastrick, near Brighouse—Rebuilding Inn	Halifax Brewery Company	W. C. Williams, 29, Southgate, Halifax.
,,	23	Gainsborough—House	Urban District Council	P. Griffith, 54, Parliament-street, Westminster.
,,	25	Glasgow—Station Extension	Glasgow and South-Western Rly. Co.	Engineer's Office, St. Enoch Station, Glasgow.

R. I.B.A., Society of Architects, and Civil Service Technical Examinations. Personal, correspondence, or resident preparation. Seventeen first places.—MIDDLETON and CARDEN, Associates R.I.B.A., 19, Craven-street, W.C.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

WOLVERHAMPTON UNION.
ERECTION of NEW WORKHOUSE, &c.—
CLERK of WORKS REQUIRED.

The Guardians of the Wolverhampton Union invite applications from competent persons for the appointment of "Clerk of Works" in connection with the erection of their new Workhouse Infirmary, &c., under the direction of their Architect, Mr. ARTHUR MARSHALL, A.R.I.B.A., of King-street, Nottingham.

The person to be appointed must have had a wide experience in buildings of this character, and be fully competent to discharge all duties and responsibilities that will devolve upon him in connection with a large contract (say £150,000).

The salary will be at the rate of £350 per annum.

A suitable person will probably retain the appointment for three years at least.

Applications, stating age and particulars of Qualifications, and enclosing not less than three testimonials, must reach me not later than 9 o'clock on WEDNESDAY, the 27th inst.

Canvassing will disqualify a candidate.

By order,
FRANK HARRISON,
Clerk to the Guardians.
Union Offices,
Wolverhampton. 1

ARCHITECT'S ASSISTANT.—WANTED, a thoroughly competent ARCHITECT'S ASSISTANT after Christmas.—State age, qualifications, references, and terms, to WILLIAM WATSON, Architect, Wakefield.

BUILDER'S CLERK WANTED for Permanency. Must be well up in p.c. accounts and usual office work.—Apply, stating salary, age, &c., and give reference, to S. F. HALLIDAY, Stamford, Lincolnshire.

MASON'S CLERK WANTED. Must be experienced to take orders and particulars of stone and marble work, also in bookkeeping, abstracting, and prime cost. Give references; state age and salary. Must be exceptionally reliable. — Write, STEPHENS, Steam Masonry Works, South Croydon.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

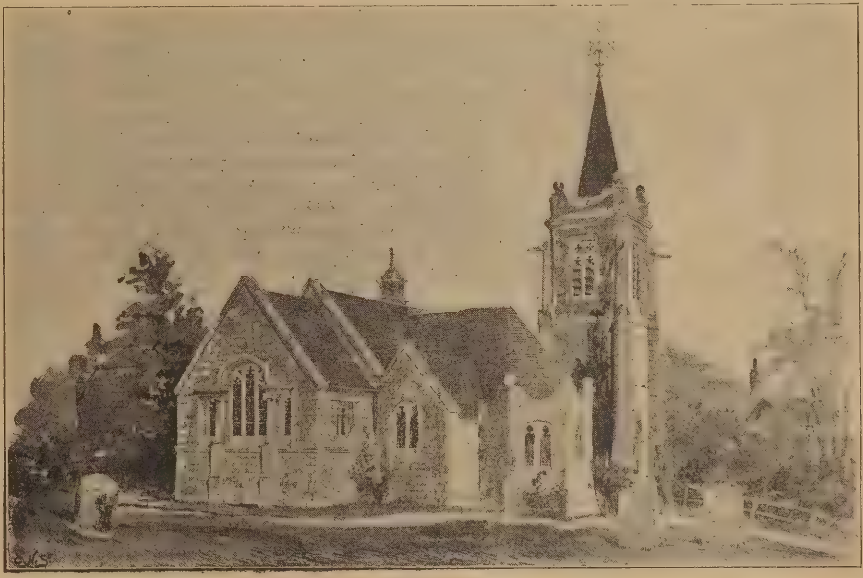
An Architectural Causerie.

Tradition in Architecture. According to our dear old Dr. Johnson, tradition is anything that is delivered orally from age to age, a definition which includes two great conditions, that it shall not be written and shall be a continuous process without break or hiatus. Tradition, then, in architecture, is the method of working which has been handed down from father to son; it is the application of those principles which form, or rather should form, the groundwork of the training given by the master to his apprentices, to be passed on by them to their successors. This holds true of the tradition of all countries, in all periods—even the most remote—irrespective of differences of race, of religion, or material available. In fact, tradition in architecture is the evolution of what is commonly called style; it cannot be too clearly understood that the architecture of every country and age was, until the Italian Renaissance, a gradual growth, the outcome of a slowly expanding tradition. For convenience sake the work is catalogued into centuries, but the dates have no bearing on the result. It is of the very essence of tradition that it shall be the common property and inheritance of the whole body of artificers, from the designer, or master mind, who originates, to the humblest artisan who helps to construct the building. The former, if of distinguished ability, may, by adopting a new material, or devising a daring piece of construction, advance a little forward beyond his predecessors; but it is always upon the same path, and those working under him are able to follow easily and naturally in his footsteps. It is difficult to overestimate this advantage; its importance lies in the sense of power and self-reliance which this steadily-growing authority gives to a community—all its members are able to express themselves simply and naturally in the same language—for architecture is speech materialised, and we know what happened at Babel. Unfortunately it is impossible to realise the advantage at the present day—for, as a nation, we may be said to be without tradition. It has been destroyed by the archæologist, though it died hard, for tradition is wonderfully tenacious and long-lived; invasion and conquest will not kill it. Indeed, it has almost invariably happened that in such a case the tradition of the two nations coalesced at once without any break of continuity—in some cases even that of the conquered maintained its supremacy and thus avenged its inferiority in the arts of war by its superior genius for the arts of peace. It is worthy of note that the Jews, who had no genius of architecture, were apparently only employed by the Egyptians, who were masters in the art, with a tradition extending back to the beginning of time, as quarrymen and carriers of stone and makers of bricks; they were fit for nothing else and might have fared better had they been better architects. It seems, therefore, from the combination of two or more traditions, and from this alone, that a new phase of living architecture is evolved—it cannot spring, Minerva-born, from a single brain. All European architecture may be said to have had a common Roman tradition. The Romanesque, the Lombardic, the Byzantine and the Norman were moulded from this common stock into different forms by the local genius of the builders. One cannot help regretting that some one part of the Roman Empire did not adhere to the pagan religion, so that we could go to, say, Naples, and see what had resulted from that tradition being handed down, unbroken and uninfluenced, to the present day. We must turn to another form of design for a parallel. Take shipbuilding. The coasting brig which is launched from the Tyne to-day is the direct descendant of the Norse Viking ship. Its spars, its ropes and appliances are more numerous, more complicated, and, we may suppose, more efficient. That is the result of 1500 years of intelligent development, but the main structure remains the same. The lines of the bow are so unaltered that "boat-shaped" has passed into the language as a clear definition; and even a resuscitated shipbuilder of Tyre, or Sidon, might take his place in a shipbuilding yard at Gateshead and find no difficulty in joining in the work, since he would be guided by the same tradition. In England, through the Middle Ages, the differences which we notice are simply due to the greater technical skill in the later periods. By successive experiments, not always successful, the men of the fourteenth and fifteenth centuries had achieved such command over their material that they created structures which would have excited the wonder, though they followed logically from the teaching, of the men of the thirteenth century. The Renaissance changed all this; for, though it produced so fine a masterpiece as St. Paul's, it was a forced growth; the artisan was not in sympathy with it; it was an endeavour to make him speak not merely a foreign, but a dead language; it was indeed "Greek" to him; and, in the endeavour to learn it, he deadened the expressive idiom of his own vernacular speech. Yet tradition was not quite destroyed: through the reigns of Queen Anne and the earlier Georges, a village carpenter could still be trusted to express himself clearly, intelligently and with some style: there is scarcely a village which does not possess work of this period that is interesting and worthy of attention, and which, there is no reason to doubt, was thought out and done by the artisan without supervision or direction. Then came the period of revivals, as ephemeral as the religious revivals of which we hear. Now Greek, now Gothic, was extolled as the only true and authentic style; each had its votaries among the *dilettante.* Architectural design became an affair of fashions, to be put off and on like a Paris confection: an architect was expected to design, now in one style, now in another, and the bewildered artisan, robbed of all chance of expression, sank into the inarticulate drudge of to-day. Adam Bede seems to be the type of the last surviving exponent of tradition in architecture. The best hope for the future lies in the quiet, resourceful determination of architects to see to it that what they have to say shall be expressed in a simple, straightforward, forcible way, which can be easily understood and appreciated, and to go on repeating it until it has sunk deep into the minds of the artisans. There need be no fear of monotony or dulness; the thoughts may vary, though the mode of expression remains the same, and there may be plenty of interest and novelty in a story told in simple words, without recourse to extravagant language or foreign quotations. One building, which strives after skilful proportion, refinement of detail and good workmanship, may serve to leaven a whole district, and the local builders may be expected, little by little and almost unconsciously, to assimilate these qualities. Happily the reign of the archæologist is at an end. One rarely now hears the question: "What style do you call the building?" One is no longer expected to give chapter and verse for a moulding; and the use of the dentil, or dog's tooth, is no longer sufficient to stamp perfection upon the design. We are free, and if we will work with the courage and restrained individuality of the earlier men we may hope to re-establish a tradition which will be honourable to ourselves and serviceable to those who follow.
H. I.



DESIGN FOR PROPOSED NEW CHURCH AT STOKE TALMAGE. E. B. LAMB, ARCHITECT.

Stoke Talmage Church. The illustration on this page shows a proposed new church at Stoke Talmage. The design is by Mr. E. B. Lamb, and is a modified form of the design submitted by his father some forty-five years ago, when a scheme was proposed, initiated by the late Lady Frankland Russell, to pull down the present ancient brick building and rebuild.

"Parking." A system prevails in some of the chief cities of the United States, notably in Washington, of introducing a little greenery into the wider streets; it is known as "parking." Where several streets meet, or where two streets converge to a point, turf and shrubs are placed, and, if the space allows it, a strip of green is formed beside the houses; trees, too, are planted on either side of the street. The fact testifies to a curious reaction in the public mind against mere bricks and mortar, even when they assume the form of noble streets; however grand the buildings, the eye tires of perpetual walls and windows; a little concealment improves their effect, and trees, shrubs, turf, and, it may be added, birds, recall the passer-by to natural things, sweeten the air, and impart geniality and colour to the town. From Paris we hear of gardens on the roofs; this was a favourite idea of the late Sir Benjamin Richardson, and played a part in his ideal City of Hygiea. The original idea of a boulevard arose when Louis XIV. pulled down the old fortifications of Paris and removed the seat of government to Versailles: the land thus gained was laid out as a wide, gently-curving line of streets three miles in length from the Bastille to the spot where now stands the Church of the Madeleine.

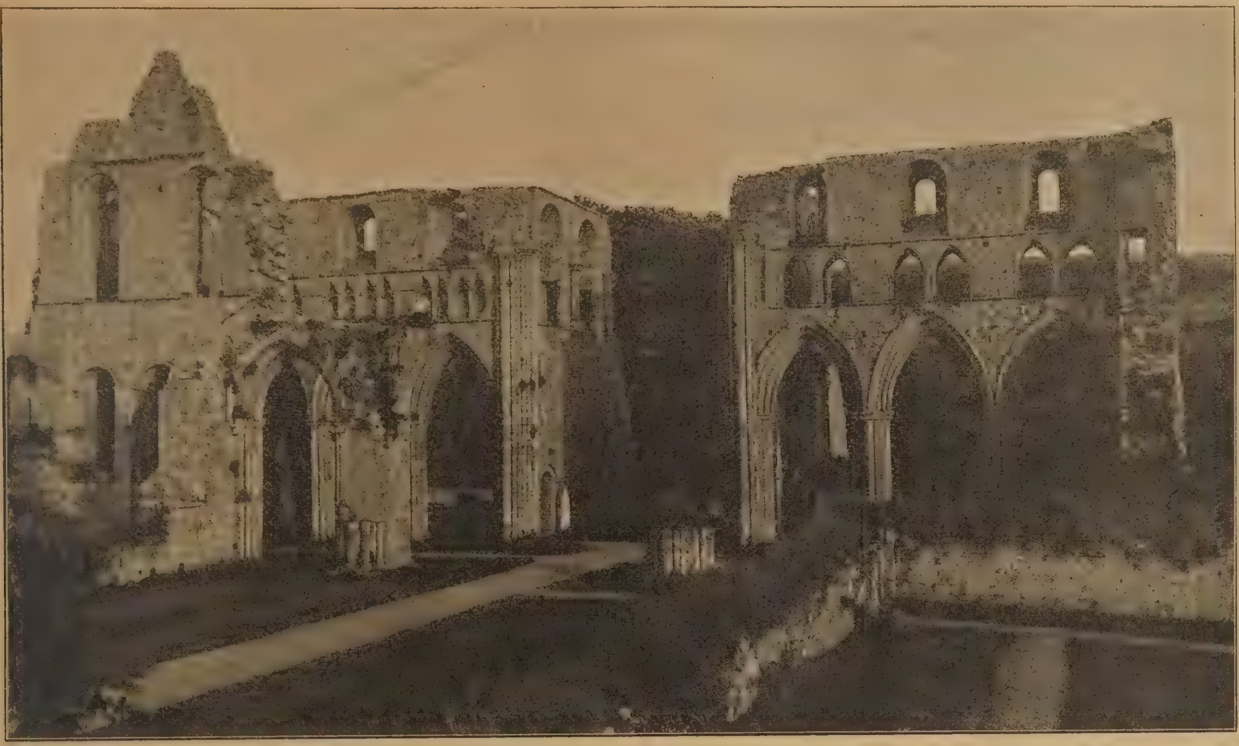
Paris remained an open town until 1840, when M. Thiers built the present walls and supplemented them by a ring of forts outside; the latter is now the accepted method of defence, and the idea has been mooted of again pulling down and levelling the *enceinte*, filling the great ditch, and building another enormous succession of boulevards. The name has, by a perversion of its meaning, been extended to almost any large street, even without trees. Nevertheless, trees large or small figure in most of the new streets in the Continental towns; sometimes, it must be admitted, they are poor specimens of their kind, weedy-looking things trying to maintain life in a desperately barren soil. Under Baron Haussmann "they ordered these things better" in Paris, and trees were transplanted to the new streets when they had attained a certain growth, together with a large quantity of their own soil, whilst no expense was spared upon new gardens. London is as yet considerably behind in street planting, but it is to be hoped that the Office of Works and the London County Council will work together to encourage it as new streets arise. In other matters than streets London is not only equal but superior to foreign capitals so far as greenery is concerned; it would be difficult to find anything as beautiful as St. James's Park abroad, and the foreigner who passed through it for the first time and continued his walk through the succession of parks to Bayswater, would be fairly astonished at the greenery of "smoky" London. The Victoria Embankment, too, is a successful instance of "parking" on a large scale, though of late years the growth of the trees seems to have been retarded by the constant burrowing of the soil by railways, sewers, and gas pipes. London air is far from unfavourable to the growth of trees, turf and ornamental shrubs, though the latter require to be carefully chosen and well looked after. In this the simplest of all methods for increasing the amenities of "town" it is too often forgotten that it is an architect's question, not merely a gardener's or a park official's. In carrying out London improvements, a number of departments, professions and trades are involved, and they seldom work harmoniously; what is needed is that the architect should harmonise the whole, so, that nature and art, buildings and verdure, fountains and sculpture should be combined in a series of pictures of which he alone can provide the frame. J. C. P.

On Reflection.

American Architects and Examinations. Architects in America as well as in this country are feeling about for a remedy against the flooding of their profession by incompetent men who mislead the public and bring discredit on the architectural profession. With this end in view, the American Institute of Architects, following in the steps of our own R.I.B.A., has decided to require candidates for admission to its ranks, after January, 1901, to pass an examination. Membership of the Institute will thus, it is hoped, in course of time be universally regarded as a guarantee of professional ability. In several States compulsory registration is in force, but the effect of this is not altogether what architects would desire; the laws, being merely local in their operation, do not give architects any status outside their own State; what they want is a kind of hall mark, the validity of which will be recognised throughout the length and breadth of the United States. Whether this desideratum will be secured by the recent decision of the A.I.A. depends upon the degree of confidence with which that institution is regarded by American architects and by the American public. In England, as we all know, there are more than one opinion about the merits of the R.I.B.A., and so it comes about that in this country there is a strong demand for legal registration as a supplement to or substitute for the diploma of the Royal Institute—the exact reverse of what is going on in America, where the demand is for the Institute diploma as a supplement to the State licence. There is at least as much need in America as in England for measures to be taken to exclude the incompetent and unqualified. It is true that in England there is nothing to prevent the auctioneer, the plumber and the ironmonger from describing themselves as architects and taking such commissions as they can get, but they do not in this country advertise their ignorance in the public prints. In America, on the other hand, it seems to be the custom for architects who want commissions to advertise for them. It is easy to imagine and to sympathise with the case of a thoroughly competent architect of practical knowledge and artistic sensibility—but lacking, perhaps, in the vulgar advertising arts which in this country we associate with the pill maker and the soap maker—who finds that while he is left in the cold the commissions of an undiscerning public are freely given to the authors of those "attractive country houses," with appalling elevations and weirdly impossible plans, which figure prominently in the advertising columns of certain American journals. If the proposed examination scheme can remedy this state of affairs, it will be a boon to architects and clients alike.

Smuggling Objects of Art. It is generally considered that smuggling is an offence belonging to the distant past; but, though, of course, it has dwindled away, it is still practised in new forms, and, shameful to say, in connection with art. There are, as everyone is aware, a large number of objects of art, antiquities, and curiosities exported from Italy yearly which are subject to taxes, some particulars of which have already appeared in former issues of this journal. As a rule, the Italian Government can be induced to allow ordinary antiquities to be exported, but it is especially vigilant over attempts to smuggle away sculptures and paintings which are subject to the tax. It has happened quite recently that three embargoes have been placed on objects purchased from abroad—one a torso bought for the Jakobsen Museum in Copenhagen, another a carved and painted sarcophagus bought surreptitiously for an American collection, and the third a bas-relief removed by stealth from a Roman church and bound for an unknown destination. This, of course, lays the students of the archæological schools, and others similarly connected, open to suspicion, and, no doubt, tends to hamper them in their work, so that the practice should be discouraged as much as possible, in order that the conscientious many may not bear the brunt of the sins of the few. It is, perhaps, peculiarly fitting to refer to this matter at a time when the proposal to start a British school at Rome is being promulgated, as smuggling of the kind referred to would be likely to prove even more deleterious to British students than it is to those of the foreign schools already represented in the old capital of the Western Empire.

Gilding: its Use and Abuse. It is an unfortunate fact, but the modern decorator abuses the art of gilding. He seems to regard it as something to be used on every possible occasion, both inside and outside the building, and the result is that the streets are full of tawdriness and rooms have a glaring and inappropriate appearance. Gold should be used sparingly and with great discretion. The very fact that an article of one material or another is gilded to make it represent something which it is not is a strong argument in its disfavour, though the employment of thin gold leaf to imitate an object made of solid gold might perhaps be less objectionable than the graining of, say, a deal door to make it look like an oaken one. But putting æsthetic principles aside for the moment, and considering the matter only from the standpoint of fitness, surely the proper application of gold leaf is a matter which seems hardly to be thought of. This abuse of gilding is perhaps carried to its greatest extent, internally, in such places as restaurants and hotels, and as these form a large item in the list of commercial buildings, the practice is the more to be condemned. It would be futile to attempt to enumerate here any rules of gilding, or to suggest what particular portions should and should not be so treated; our object is simply to point out the abuse and to try to abate it. By many mechanical so-called decorators it seems to be thought an axiom that, when the cost allows it, such parts as the caps and fluting of pillars and pilasters, cornices, &c., should in all cases be gilded, and very often one sees gold introduced largely in the wall-paper. Gold—that is, imitation gold—is not to be used haphazard and indiscriminately. For some purposes it is admirable, but they are few in number. The ordinary picture-framer encloses all his pictures in gold frames; the more capable and artistic craftsman appreciates the value of plain frames for some subjects. This serves as an example to show what is needed—a more discreet application of gold leaf. In speaking of this matter, it might be well just to refer to those external disfigurements of our architecture—the mammoth gilded letters. The offensiveness of these does not need to be pointed out to anyone possessing the least feeling for harmony or artistic effect. We do not say that they are rendered objectionable entirely by the gilding, but that this aggravates their appearance.



DUNDRENNAN ABBEY: GENERAL VIEW OF TRANSEPT WALLS, LOOKING TOWARDS CHOIR.

THE ABBEYS OF KIRKCUDBRIGHTSHIRE.*

By EDWIN FORBES.

AT no great distance from each other in and around the stewartry of Kirkcudbrightshire are scattered abbeys, keeps and castles, all in a greater or less degree of preservation or restoration, and each with an interest and style of its own.

Dundrennan Abbey.

The Abbey of Dundrennan is situated in the parish of Rerwick, about two miles from the shores of the Solway and six miles and a half south-east of the town of Kirkcudbright. It belongs to the Cistercian Order, but has hardly any history beyond what its stones can supply us with. The name of its founder even is somewhat obscure, David I. being ascribed by some, and Fergus, Lord of Galloway, by others. In any case, building seems to have been begun about the middle of the twelfth century, for we find in existing annals the fact recorded that "in 1142, one W. Brun was sent from Edinburgh to superintend the building." Other glimpses reveal particulars of the death of the first abbot in 1188; of the abbot and monks who traded with Ireland in 1280; of the sheltering of Mary, Queen of Scots, during her flight after the battle of Langside, and of her spending under the abbey's roof her last night in Scotland.

In 1605, at the death of the last abbot, the abbey was suppressed, the monks migrating to France, carrying with them the chartulary and other valuables belonging to the abbey. Tradition has it that the abbey was burned, through some charred pieces of wood having been found; but it is more probable that time and neglect brought on its ultimate ruin. For a time, till 1742, part of it was used as a parish church, but after that date it became a convenient quarry to all and sundry for building purposes.

The abbey was laid out on the normal Cistercian plan, which also applies to the abbeys of Sweetheart and Glenluce. This order never built in town, but in sheltered valleys near water. They ranked the church as first in importance amongst their buildings, and it was always dedicated to St. Mary and was characterised by extreme simplicity. The choir was invariably short, seldom more than two bays in length, reckoning from the crossing. The crossing was covered by a low square tower or lantern carried over the intersection and finished with a gabled or saddle-back roof, as may be seen at Sweetheart; the transepts had eastern aisles divided for chapels. Decoration was manifestly discouraged by this order in those early days of rigorous discipline, whitewash apparently being the only permissible medium. But let us enter the precincts of Dundrennan and see in its remains a further illustration of the Cistercian plan.

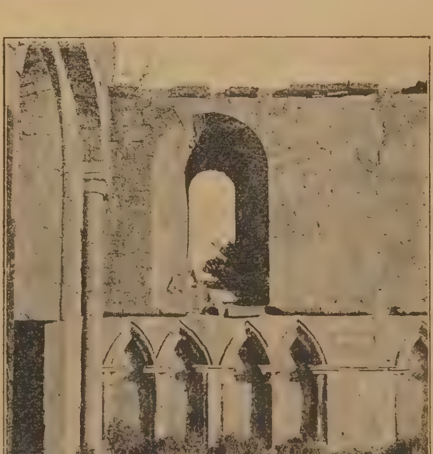
The conventual buildings formed three sides of the square or cloisters, the church forming the fourth, and the whole being connected with a pentise or covered walk.

We enter the south transept, where a modern doorway leads to what is thought to have been a mortuary chamber, which again communicated with the cloisters on the west, while on the east was the slyp. Next comes the chapter house, the remains of which show that the roof was supported by six pillars. The carving in the windows is composed of incised crosses formed by conventional lilies and Scotch thistles. The caps and bases resemble the Early English, while the Norman nail-head toothing is everywhere employed.

Over the chapter house was the scriptorium or library, of which alone remains part of two of the windows.

South of the chapter house was the refectory, with the dorter, or dormitory, over it. It was 27ft. wide and probably three or four times as long. The vaulting was supported by a single row of plain octagonal pillars; part of one is still standing. Opening from the refectory on the east side are presumably the remains of a lavatory, and still farther east the remains of the abbot's lodging. On the south side are small enclosures, or office-houses, connected with the kitchen on the one side and with the cloisters on the other. The cloister-garth formed a square of 104ft., and in the south-west corner is a door which led to the locutorium or monks' parlour. To the west of the cloister court are six barrel-shaped vaults of unequal size, used as storehouses, while over these would be the strangers' dormitory.

Monuments abound in this abbey, amongst the most interesting being the abbot's, the cellarer's, the nun's, the prior's, and that of the Belted Knight. Those of the abbot and the cellarer were removed in 1888 from the chapter house to the west end of the nave. The abbot's stone shows in bas-relief the figure of an abbot clad in travelling dress, with cowl and hood. The head is uncovered, showing the hair at the sides and a tuft in front, and the right hand rests upon the heart; above it may he seen the hilt and cross-hand guard of a dagger, the hilt being uppermost. The left hand lies open on the pastoral staff, which rests on the left shoulder and passes diagonally along the whole length of the body. The crook of the staff is turned inwards, denoting—not in later times, however—that the abbot had jurisdiction only in the abbey. In the upper corner is a six-petalled flower, intended, evidently, for a rose. The abbot stands on a



DETAIL OF TRANSEPT WALL, DUNDRENNAN ABBEY.

SEDILIA, LINCLUDEN COLLEGE.

human figure recumbent and clad in the garb of "Old Gaul." (There is a figure similar in every respect in the nave of Paisley Abbey.) The legs and feet of the figure hang over the side of the stone and from a deep gash under the ribs on the right side the bowels protrude. The left arm grasps the right foot of the abbot, and the head is inclined upwards and is pierced by the abbot's staff. The stone bears no date, but on another, dated 1489, there are the same six-petalled flowers, suggesting the possibility that both stones are the work of the same sculptor.

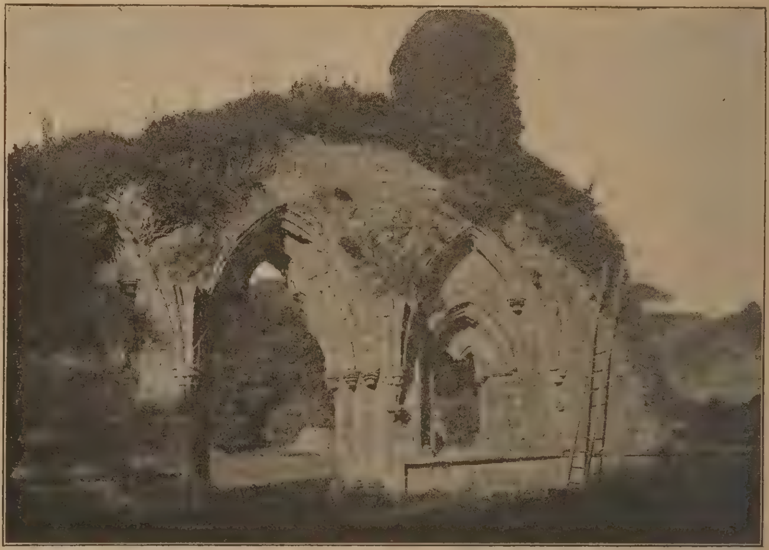
The nun's stone represents a young woman clad in a long dress gathered at the waist by a belt. Over this is a mantle reaching to the knees, a wimple enfolds the neck, and the veil is thrown back. The hands are crossed over the breast and the feet rest upon dogs couchant gardant, turned tail to tail. The inscription is badly cut and spaced, but seems to read thus: "Here rests in Jesus, Sybil, at one time Lady of Prichy, who died in the year of our Lord 1440." As to how this lady came to be buried in a Cistercian monastery, history is silent. Different theories have been propounded, one that this is the last prioress of Lincluden, who, on her expulsion from that convent by Archibald Earl Douglas, took refuge in Dundrennan, died, and was buried there. But while we know that the Pope had acquiesced in the expulsion of the nuns from Lincluden, we can hardly suppose that he would sanction the admission of one of them to this other monastic institution.

Glenluce Abbey.

We now move across country to Glenluce, another example of the Cistercian Order. This abbey is beautifully situated on the river Luce, one mile and a half north of Glenluce. It was founded in 1190 by Roland of Galloway, Constable of Scotland, and one of a family which made itself famous by the founding of such institutions. Fergus, Roland's grandfather, was himself the founder of three monasteries of the Premonstratensian Order. The remains of the church are most likely those of the original building, finished before 1240; these remains, and other fragments, point to Early English of the best period. The east end of the cloister-garth must have been rebuilt about the end of the fifteenth century, and the chapter house evidently belongs to this later period.

The general plan is very similar to Dundrennan and Sweetheart; the three coincide in almost every point. The Ayrshire and Galloway Archæological Society is at present engaged in clearing out the fallen *débris*, and when this is finished it will be possible to restore the plan which at present is buried.

The chapels of the transepts have been vaulted, but the few corbels rather suggest a wooden roof throughout the rest of the building. A singular feature is a circular stair partially corbelled into the south transept and rising above the apex of the gable, where it doubtless terminated in a conical-roofed turret, referred to by Symson, in 1684, as a steeple. Off this transept were the sacristry and slyp, both still obliterated by rubbish. The chapter house is 24ft. square and has a centre column.



DUNDRENNAN ABBEY: VIEW OF CHAPTER HOUSE LOOKING FROM CHAPTER HOUSE TO CLOISTER GARTH.

The vaulting is quadripartite, the ribs resting on the central column and on the corbels on the wall. The bosses at the intersections in the two easternmost compartments bear shields having coats of arms, one being the arms of Scotland, the other the crowned lion of the Province of Galloway.

The other intersections bear foliated and grotesque works of a very spirited description. There is no trace of a door having been hung in the slightly pointed doorway. Above the chapter house would probably be the scriptorium, the tiled floor and fireplace of which were partially exposed in 1884.

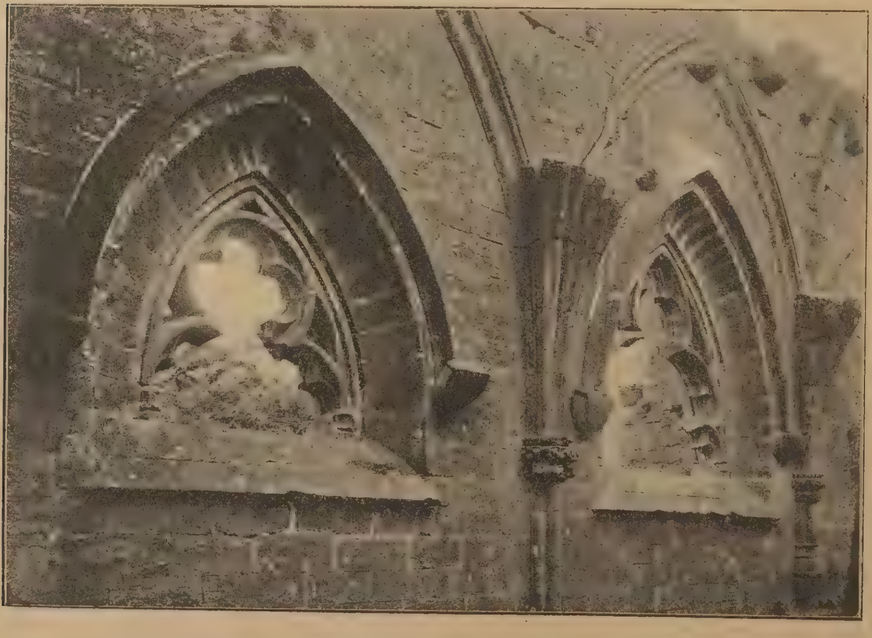
Sweetheart Abbey.

In the picturesque village of New Abbey, at the end of its one long, straggling, white-washed street, stand the ruins of Sweetheart, the last of this trio of Cistercians and a charming example of bold Scottish Gothic, worthy of minute study. More extensive and complete than those already described, the remains of Sweetheart speak for themselves and need few words to describe them. We are all familiar with the picture which history has preserved to us, and which even to-day gives a touch of romance to its stones—how Devergilla, wife of John Baliol, after carrying about with her in a casket the heart of her husband, built this house beautiful to his memory and laid his heart to rest within its walls, calling it as she did so, "Dulce Cors." Even the abbots shared in this mellifluent title, and bore the name of Dominus Dulcis. There is little in the subsequent history of the abbey worth recording, but we learn that it was struck by lightning and considerably injured about 1370.

Lincluden College.

A walk of a few miles along the banks of the Nith brings us to that most interesting building, Lincluden College. This college, or provestry, is situated near the confluence of the Cluden with the Nith, about one mile from Dumfries, and was originally a convent for Benedictine nuns. It was founded in the reign of Malcolm I., by Uchtred, son of Fergus, Lord of Galloway, who endowed it with considerable territorial possessions in the neighbourhood. We read that in 1296 Alianne, the prioress, swore fealty to Edward I. at Berwick and was confirmed by him in her dignity, but one century later we find the nuns expelled by Archibald the Grim, Earl of Douglas, and an ecclesiastical college founded in its stead.

Originally it comprised a group of buildings



WINDOWS IN NORTH WALL OF CHOIR, LINCLUDEN COLLEGE.

which enclosed a spacious court, the east side of which was occupied by the provost's residence, the south side by the church, the north by a refectory and dormitory, while the west was formed by a wall with entrance gate.

The collegiate church, which stands on the site of the original church, is one of the earliest of the Revival period. It embraces the chancel, the south transept, a transeptal chapel, the south aisle and the sacristy. The two vaulted chambers north of the sacristy also belong to this period.

This church, like the abbey which preceded it, is of small extent, but it stands out unsurpassed by any of its class for the boldness, richness and purity of its architecture. Externally, the noticeable features of the building are the projecting buttresses rising to the height of the side walls, unbroken by any intake, the large double base extending round the walls, the cornice decorated with richly-carved foliage, and the well-proportioned pointed windows enclosed in peculiar and very bold hood mouldings and originally divided by mullions, with rich geometrical tracery inclining to leaf and flame forms.

Internally, the beautiful proportion of the church is impressive. The side chapel and the aisles have been roofed over at a uniform height with groined and ribbed vaulting. There was an apartment over the chapel, probably a domus inclusi, lighted by a small two-light window and approached by a newel stair within a projection at the angle formed by the chapel and chancel. The vaulting to this chapel has been constructed of rag-work—that is, small, flat bedded stones, from ½in. to 3in. in thickness, entirely unhewn and set in a thick bed of mortar.

Separating the nave from the chancel is the rood screen in stone and over it the rood loft and chancel arch. This latter is segmentally pointed and the imposts are shafted with floreated capitals.

On entering the chancel, the eastern window is seen to occupy nearly the whole width of the wall and upwards to the vaulting. Below it are the corbels which supported the slab of the high altar, and on its sill is a small carved bracket. In the south wall are a triple sedilia and a piscina, opposite to which is the tomb of Margaret, Countess of Douglas, eldest daughter of King Robert III. These are all of the most beautiful design and workmanship and very similar in detail.

The chancel was roofed by groined and ribbed vaulting in three divisions; the vaulting shafts and parts of the ribs are still on the walls. Over the vaulting of the chancel, as in the case of the transeptal chapel, there was an apartment roofed by plain stone vaulting, with large chamfered transverse ribs; the bottoms of these latter alone remain. The sacristy is on the north and the provost's lodging extended north from it. The basement of the latter consists of five vaulted cellars; the first floor appears to have contained a square apartment at the north end and the remainder of this floor probably formed the great hall extending over the sacristy. The north part was carried up as a square tower terminated by crow-stepped gables. The entrance door opened upon the octagonal staircase, and the stair, which gave access to the several floors and which seems to have been quite a feature, fell in 1851. We learn that mass was performed on Christmas Eve, 1585, in this ancient fane with unusual pomp and splendour, but since then it has neither been said nor sung in the House of Uchtred.

Cærlaverock Castle.

Far from the busy haunts of men this castle is most romantically situated on the shores of the Solway, ten miles south of Dumfries. It is triangular on plan with double towers over its entrance, while the other angles are terminated by single circular towers. The castle in its present state is the work of six distinct periods, the last of which is by far the most interesting and includes two of the elevations to the inner courtyard, which was built about 1630 in the Renaissance style. To quote from Messrs. MacGibbon and Ross, the grouping and design is such as entitles it to rank as one of the finest and richest specimens of Early Renaissance in Scotland.

Such is a brief *résumé* of the chief ancient buildings in and about the stewartry of Kirkcudbrightshire, which, in addition to their own peculiar and intristic interest, are situated in a country which is both romantic and beautiful and lends to them that charm and beauty distinctly and irrevocably associated with Nature.

CHURCH ARCHITECTURE:

WHAT IT IS AND WHAT IT MIGHT BE.

By L. RYCROFT OAKES.

THERE is a nameless feeling which creeps into the spirit and seems to freeze the blood as it courses through our veins when we stand under the shadow of a glorious church—a building erected as a labour of love to the glory of God in the Highest. Ruskin says: "The greatest glory of a building is not in its stones, nor in its gold; its glory is in its age. . . . It is in that golden stain of time that we are to look for the real light, colour and preciousness of Architecture." But is this correct? Will all our modern churches and villas, when their walls have been "encrusted with fame and hallowed by the deeds of men"—will *they* impart this strange, nameless feeling? Years hence, will our descendants look upon these modern creations which serve as churches and say they were the works of men struggling after a nobler and higher life, that they were materialised prayers to God himself?

PART OF SOUTH WALL OF CHOIR, LINCLUDEN COLLEGE.

No! even when Nature has laid her kindly hand on these harsh, unspeaking stones when the hungry moss and lichen have added yet another tinge to these barren walls, they will remain unchanged, save as a record of a past generation. What then is this charm—apart from age—which pervades these buildings of our forefathers? It is the indescribable passion which they engrafted into the smallest detail, into every length of moulding, every piece of stone or wood. The insignificance of the part mattered not to them; it was a labour unto God—and a gift. Each man felt that he had imparted to the stones an individuality which was his own and could single out, from some part of the building, work which was an incrustation of his feelings. No wonder then our modern buildings are so lifeless, with mouldings and ornament worked by unsympathetic masons, who neither understand what they work nor care what they are working for. No wonder the Art-loving public treat Architecture with indifference and contempt. And yet we complain and wonder why the "man in the street" does not interest himself in these *our* productions. The battle of the styles is a thing of the past, but its effect is still seen in our churches. Speak to an architect concerning a church and his mind turns instantly to a Gothic building, or something akin. It is impossible for him to dispense with pointed arches, crockets and pinnacles—they fall from his pencil unconsciously, almost irresistibly; he runs in a groove from which he never attempts to extricate himself. Certainly we are occasionally greeted with pleasant surprises of originality which are, to some extent, effective, but, the spirit being wanting, there all things end.

We go on improving and re-arranging the styles in a very clever manner, no doubt, but we do it as a matter of necessity, thinking probably that we are treading in the footsteps of a by-gone generation. But no! they were craftsmen who have left no successors. We must therefore *create* if we wish to be as they, to be artists on an equality with the painter and sculptor.

One of our greatest architects says, "It is not by imitating the works of the old masters or *improving* them, nor by analysing their principles of design, that we shall equal or surpass them, but it is by drinking at the same fount, drawing our inspiration from the same source, continuing the paths which they began." This, then, is the precept we must follow. We may ask, what was their fount? Was it the works of their forefathers, or measuring and copying the works of their ancestors?

No! Nature was the fount from which they drank; Nature the source of their inspiration; the birds, the fishes, the woodlands and mountains the springs from which their creations emanated. Theirs were the creations of men of a different age and different morals. The quiet, uneventful monastery life, the wandering of the masons from town to town and village to village, cannot be compared to the wear and tear system of this nineteenth century. We see things in a new light and under altered circumstances. In the push and scramble for existence men's natures naturally change, they become hard and barren, the creative element is choked. As a relief, they fly to antiquity with note book and two-foot rule and there copy precisely and accurately the mouldings and ornaments.

I do not advocate a disrespect for old work, far from it, but the continual copying of its detail turns us into mere machines; we simply delineate with our pencil that which has become a constant habit to our hand and form to our eye. We are no more artists than the labourers are craftsmen. If architects would only go to Nature and there study and translate it for themselves, and would endeavour to create among artizans an interest in their buildings, visiting the works more as leaders and directors than as fault finders, what a change there would be in ecclesiastical work!

Many will raise the question, What do we gain by going to Nature? What are the great lessons we should learn or principles we should discover? The answer is "all things," and perhaps the foremost of all "construction." What triumphs of engineering are to be found among Nature's works; what perfection in balance, stress and equilibrium! Everything is calculated to a wonderful degree. There are lessons for the greatest engineer, let alone the greatest architect. Simplicity is a feature that strikes us when viewing her marvellous works; all her laws are founded on the most elementary basis; there is nothing indirect in her methods; her naïve, unaffected simplicity and her minute adjustment of quantity are an example to all. Seldom do we see anything superfluous; if this exists its life is but of short duration and excess of growth is either choked or killed by others. Every branch and stem, every leaf and flower, have a part to fulfil, there are no *extra* leaves for ornamental purposes; everything is perfect, and, if robbed of that perfectness, suffers to a certain extent, either more or less. It is this "so much and no more," this knowing when to stop, that teaches us such a grand lesson in ornamentation. The overcrowding and cramming of every available space on a building with mechanical carving and moulding fills one with satiety and weariness; even beautiful, glorious sunshine would become to us monotonous if it were not for the shadows thrown from passing clouds and the shades of evening and of night.

Truth is always manifest; Nature never lies. This great fact becomes evident at first sight and so forcible is it at times that it would impress the most cloudy and unobservant mind.

It is here in these woodlands and meadows, these fairy gardens, that exquisite forms are so apparent. What mouldings flit through our imagination as we sit on the bank of some rushing stream and watch the grace of lines in the swirl of the water. Thousands upon thousands of the most delicate and varied contours abound here; all is full of harmonious lines, from the beautiful sweep of the swallow as it skims through the air to the tender and delicate curve of the reed, bent in the wind. It is here that we find the bold effects of light and shade and the majestic grouping of members. Nowhere is beauty so abundant, nowhere are suggestions so freely given; and yet we pass through it sometimes, almost daily, and never see or think of these, God's greatest gift to man.

Then comes that last and perhaps most captivating of all lessons—colour. Even those who are blind and insensible to most of its beauties will occasionally be struck by its glorious tints. Nobody who sees the dying glow of sunset can turn away without being subdued, for a moment at least, by its superb and solemn grandeur. Nightfall, with its saffrons and pale greens, morning, with its dew and aromatic freshness, are equally beautiful. This constant change gives us endless opportunities for studying colour to its widest extent. The tidal flow of the vast ocean, with its variegated greens and patches of white foam, form in the imagination the grandest mosaic pavements. And the glories of stained glass are revealed from the fringe of the wood as the sun sets behind the low range of hills. The greatest painters of every school obtained from nature the secret of those marvellous tones. Can we therefore disparage it when greater men than we have set the example?

This question of painters and colours brings to our mind another weak spot in ecclesiastical work, namely, the use of frescoes. How seldom in this country, when Art has reached a perfection never before attained in England, do we see a church the walls of which are adorned with frescoes by any great painter. The money spent on insignificant mouldings and decoration would, in many cases, furnish the interior with a range of good frescoes. But it is not always for the want of money that this dearth occurs. We architects alienate ourselves from our brother artists and desire to be the designers of all things. It is not suggested that the painter should be allowed a free hand to decorate the building as he chooses. The architect must be the director, the painter the executor and artist.

But we seem to prefer to leave out this beautiful jewel rather than to see another name coupled with our own. If this is the truth, then we are in a sad state, indeed. When Art has attained such a degree of excellence, can we architects stand sullenly aloof? Can we stand afar off and let these men pass from our midst? Men whose equal we may never again see; men whose works may carry the weary to a shining far-off shore and give to them for a brief space a glimpse of the land beyond. And most of these are men among us to-day—some are at rest in a brighter world—and yet we scorn or refuse their aid; we refuse that which would be our greatest comfort and that which would most forcibly appeal to the public mind.

Many of us know Mr. H. Wilson's description of an ideal church. For those who do not, it will bear repetition. He says: "Picture for yourself a mere barn boldly buttressed, showing high above the roofs of some town, or set among the hills and rising from them sheer and rugged as a cliff, entered not too suddenly by a pillared porch arched over with a mosaic vault, where the prisoned sunlight glows even on gloomy days. Through a door covered with story or device in beaten metal, you step into a solemn and simple hall—a nave it may be—with walls recessed to give shadow and surface change, the windows few and lofty, mere holes, through which the light, attempered and made more mystical by pale figures in the glazing, opaline in colour, like crystal for clearness, floats down upon the floor and floods the walls with a tender brightness. On the upper surfaces of the walls Burne-Jones should spread a range of mosaics or frescoes, like a skin stretching round the piers and arches, over soffites, and into the window recesses. The eye in its wanderings should suffer no check, but be led insensibly by imperceptible transitions to the very focus of the building. The end walls should be frescoed by Watts, and beneath the frescoes, and continued round the whole building, should be a broad dado of marble sheeting or rich plain colour. The floor should be a chequered sea of sombre-tinted stone, the roof a crossing maze of timbers quaintly coloured and enlivened by gold. What a hall for music might be here, or what a church! If the latter, imagine the sudden rise of steps at the choir level, like a wave in the sea of stone, bearing noble stall work on its breast; then the further lift at the altar level supporting the reredos or baldachin, glowing with colour like an altar fire. The altar itself, a piece of solemn sculpture, or a master work wrought with all the resources of the modern goldsmith's art, set with enamel and fine relief in beaten silver. The lamps, the chandelier and coronæ, the brazen gates, the chalices and censers, the patens and the salvers of shining silver enriched with reverent fancies and dedicated skill."

What a beautiful dream this is! What a calm, peaceful grandeur would reign in such a church! A church where the weary soul would find rest from the jarring world without; where the "fool who came to scoff, remains to pray." Truly, such a church would be a "joy and a blessing ever to pass near," and would "bring the light into our eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

And why is this all a dream? Because we stand aloof from our brother artists; we disregard Nature and her laws and slavishly copy the works of a by-gone generation. We might overcome these things if we would, but a conservative blood runs in our veins. We were taught by great men who instilled into us the principles of Gothic Architecture and whose teaching we cannot thus throw lightly aside. It is to the coming generation then that we must turn our attention. Show them the folly of copyism and alienation from their great supporters. Teach them to go to Nature, not solely as a matter of necessity and toil, but as a labour of love. Then will they become conscious of her great power and beauty; then shall we have churches worthy of the name and worthy of Him to whose everlasting glory and majesty they are dedicated.

New Board Schools at Weston-super-Mare have been built in the Locking Road. The site has cost £2,032, the building £4,565, the furniture £300, and the heating apparatus £307. There is a large central hall surrounded by seven classrooms, five of which are seated for sixty children each, and the other two for fifty each, 400 in all.

An Exhibition of Religious Art, otherwise known as the "Exposition Durendal," is now open at the Musée Moderne at Brussels. Mr. Walter Crane, Miss Catherine Weeks, Miss Newell and Miss Morris (of Hammersmith) are among the English exhibitors. The exhibition will remain open until January 25th.

An Aberdeen Councillor as Art Critic, —In a discussion at a recent meeting of the Aberdeen Town Council upon the advisibility of taking over the Art Gallery and Museum it was pointed out that unless the Corporation allowed a charge to be made for admittance to the artists' exhibitions these could not be held there. Councillor Gray, in opposing the making of a charge for admittance, expressed his opinion that the artists' exhibitions were very often rubbishy. The Lord Provost said the artists' exhibitions were not only a great treat to the citizens—they were not rubbishy—but they helped to develop the artistic student. Aberdeen had produced a great many good artists, and they should not desire to check them.

Views and Reviews.

CELEBRITIES AND OTHERS.

This compilation is so well known that it will be unnecessary to mention its advantages further than to say that it is absolutely necessary to anyone wishing to keep up-to-date in all information with regard to persons of eminence. Although this is the fifty-second year of its publication, it shows not the slightest falling-off in supplying information of the most recent occurrence. The book becomes larger year by year, yet is not unwieldy—in fact, it is a pleasure to handle, so neatly is it bound and printed. In this number several of the tables have been left out thus greatly facilitating the quick finding of information, and occurrences up to October 31st have been recorded. The lists dealing with the Press are about the only things not to be relied upon; the list of societies might be added to, and particulars of their chief officers given. We cannot praise too highly the get-up of the book—the binding is most neat, and the paper exceptionally good, considering the cost.

"Who's Who, 1900? An Annual Biographical Dictionary." Fifty-second year of publication. London Adam and Charles Black, Soho Square.

"AS OLD AS ADAM"—

It may be, but if so we pity Adam. If he had to suffer the contemplation of a system as intricate and wonderful as this without the aid of this lucid treatise, no wonder need be expressed at his fall. But we are happily in a position to enjoy the system with the aid of this book. We must really congratulate the author on his dry, though unintentional, humour. We were under the impression that the exponents of this science of geometrical figures who claim religious derivation and symbolism for these figures had been overcome by the ridicule lavished upon them, and it is with much pleasure we find this is not so, and that the humour of it is not lost to us yet.

In introducing the subject the author presses on us the remark that "measurement by angle is peculiarly adapted for establishing a relationship between bodies varying much in size and in distance from each other, for the angle remains the same, as measured by degrees, whether the lines containing it be inches or leagues in length." And we would remark in return that by dividing the "Heaven-circle" (*sic*) into eight or twelve equal parts he can distort almost any shaped figure into coinciding with some part of these divisions, and still retaining some semblance to its former self. It is in this way that the Cadmean alphabet is made to appear derived from geometric forms. But we are not confined to the circle; the square, the rectilineal triangle, and lozenge composed of two equilateral triangles are all brought into service, and an attempt is made to show that they bear some relation to each other.

The author has not kept to any restricted range of examples in support of his arguments, but instances the game of chess (by the way, he does not forget to refer, in this connection, to a circular—or shall we say "heavenly"—chess-board he has registered at the Patent Office), the game of draughts, the clock dial, the mariners' compass, playing-cards, and—we are patriotically grateful for it—the Union Jack. Those who delight in the symbolical and the mystical will no doubt find pleasure in this curious pamphlet, and others may—as we have suggested—find its perusal not altogether unamusing.

"As Old as Adam; or, First Principles in Religious Geometrical Symbols and Alphabetical Characters," by Joseph Houghton Spencer, architect. London: James Nisbet and Co., Ltd., 21, Berners-street, W. Price, 1s.

THE STRENGTH OF MATERIALS.

Without the least atttempt to startle the world with new theories or methods for the determination of stresses, Professor Ewing has in this book collected together, systematically arranged and clearly expounded a series of statical facts of the highest importance. It is not too much to say that, in spite of its comparatively small bulk, it is the best and most exhaustive work on the subject which has yet appeared in English, the most learned, the most comprehensive and the most intelligible. At the same time, though readily comprehensible by anyone acquainted with the elementary statical laws and accustomed to algebraical and trigonometrical equations, it is hardly the book for a beginner, and it is quite possible that even more advanced readers might at first be confused by the use of unaccustomed terms, what is generally known as *The* Modulus of Rupture being called Young's Modulus, for instance (because there are in reality three different moduli of rupture); and a beam fixed at both ends being known as an "encastré beam." But these things would only confuse momentarily, and to set against them there is a general excellence which is highly laudable. In fact, the excellence is so general throughout that it is difficult in the extreme to select any portions for special mention in a necessarily short review. At the very commencement the relationships between stress and strain are set forth with a clearness never hitherto approached; and so, later on, is the determination of the stresses in framed structures by the "Method of Sections," and in certain specially difficult cases of roofs by means of the stress diagram; and so on, point by point, until the book closes with the consideration of hanging chains and arched ribs.

"The Strength of Materials." By J. A. Ewing, M.A., B.Sc., &c. University Press, Cambridge. Price, 12s.

GEORGE HERBERT, ILLUSTRATED.

Those who know the charm of quaint old George Herbert may be glad to have their attention called to a very interesting illustrated edition of his poems, which Messrs. Seeley have just issued; and those who do not could hardly find a better means for becoming acquainted with his piety and wit and wisdom than this dainty volume affords. It was a happy idea to present Herbert's sacred poems in conjunction with reproductions of old engravings which the poet is quite likely to have seen, and which may in some cases have suggested the poems themselves. The anonymous compiler has shown great ingenuity in finding illustrations—generally by no means inapt—for so large a number of verses. A considerable proportion of the engravings reproduced are by Albert Dürer, and one realises when the works of the artist and the poet are regarded side by side some striking resemblances between them. Strength, directness, simplicity, and a homely familiarity, which is only saved from being irreverent by the intensity of the religious feeling underlying it, are equally characteristic of the poems and the pictures. One small criticism we have to make of this otherwise admirable volume; the illustrations are inserted without title or artist's name, and to find these particulars one has to turn to the list of illustrations at the beginning of the book; this is a rather exasperating arrangement, as the special value of this edition lies in its curious illustrations, and the reader naturally wishes to be informed as to their source.

"The Temple": Sacred poems by George Herbert, with engravings after old masters. London: Seeley and Co., Ltd. 3s. 6d.

THE LIABILITIES OF THE SURVEYOR.

In these days of many by-laws and regulations it behoves all to become acquainted with the liabilities to which they are exposed in connection with their business or profession, and it is, unfortunately, in the records of the law-courts that these liabilities most prominently and constantly come before our eyes. In the hand-book under review it is the liabilities of the road and highway surveyor that are dealt with. It is now well established that an action will not lie against a road authority for personal injury sustained by an accident due to the mere non-repair of a highway, but in case of misfeasance, or wrong performance, they are liable for the negligence of their servants. This is illustrated by the case of Foreman v. Canterbury Corporation (L.R., 6 Q.B., 214), where a heap of stones was left by the side of a road without a light, and the plaintiff on a dark night drove his cart against it and was upset and injured. The obstacle had been left on the road by the negligence of the persons employed by the Corporation to repair the roads, and it was held that the Corporation were liable. There are five parts to the book, namely:—(1) Accidents on highways and the liability of highway authorities and others in connection therewith; (2) encroachment on and obstruction of highways, and the rights and liabilities of adjoining owners; (3) extraordinary traffic; (4) the maintenance, repair, and improvement of streets, roads, and bridges, and the rights, duties, and liabilities of highway authorities; (5) private street works and the laying out of new streets. The original notes (in "The Surveyor and Municipal and County Engineer") have in every case been thoroughly revised, and in many cases almost entirely re-written, and the result is a reference book which should be especially useful to the road surveyor.

"A Hand-Book of Highway Cases." Edited by J. B. Reignier Conder. London: St. Bride's Press, Ltd. 2s. 6d., nett.

ENGINEERING TABLES AND RULES.

The thirteenth annual issue of this little compilation consists of 25,000 copies, and is larger than any of the former editions. There are a great many books of tables and formulæ at the service of the engineer and architect, but this one is especially useful on account of its portability and the concise manner in which all the information is given; besides which it is well printed on fairly-good paper. Mr. Frederick Grover, A.M.I.C.E., M.I.M.E., has written a chapter on gas engines, and we note that under the section dealing with boiler chimneys it is stated that where four tons of coal are burnt per week of fifty-six hours a fair height for the chimney would be 75ft.; for 50 tons, 140ft.; for 100 tons, 180ft.; and for 150 tons and more, 200ft. A round chimney is better than a square one, and the area of the foundation should be such that the pressure on the firm earth does not exceed one ton per square foot. Some interesting figures are given by Mr. W. H. Atherton, B.Sc., under "Beams and Girders," and this chapter concludes with a lucid summary of operations in designing a beam. There is given on page 226 a very useful table of particulars and efficiencies of the electric crane, which has come greatly into vogue during recent years, and has proved to be more compact and convenient than any other. An electric crane weighing 24 tons, and having a span of 45ft., will lift 30 tons at the rate of 2·4ft. per minute, fully loaded; it will travel, fully loaded, at the rate of 41ft. per minute, and its traversing speed for the same time and under the same conditions is 20ft. Its hoisting efficiency at full load is 54·3 per cent. The diary has more than doubled in size since the first number appeared, and, supplemented as it is with numerous diagrams, is a decidedly handy and cheap production.

"The 'Mechanical World' Pocket Diary and Year Book for 1900." Manchester: Emmott and Co., Ltd. Price, 6d.

EXCAVATIONS IN OXFORD.

This pamphlet is an account of the excavations undertaken by the Oxford Architectural and Historical Society during August and September this year. These excavations are important, apart from the discoveries made, on account of their being the first systematic work of the kind which has been taken in hand at Oxford at any rate during this century, and most probably for a hundred years or more before. The committee entrusted with the work, as originally formed, consisted of Mr. Madan, president of the Society, Mr. James Parker and Mr. Herbert Hurst. With these were associated two volunteers, Mr. W. Mansell Merry, M.A., vicar of St. Michael's, who is responsible for the excellent photographs illustrating the pamphlet, and Mr. Fraser H. Penny, M.A., the writer of the pamphlet. The object of the excavations was to trace the course of the old city wall through the seventy or eighty yards space between the south wall of the Sheldonian Theatre (up to which the city wall can be traced with tolerable accuracy) and what was a Lady Chapel standing near Smith Gate, or, what is now, the corner of New College Lane, close to which it reappears. The result of the work was to find the remains of two city walls and to develop the bastion, apparently built against a wall running almost diagonally across the Quad. This wall, trending N.E. towards the Lady Chapel, was from 6ft. to 7ft. 8in. thick; the walls of the bastion were 5ft. thick and on each side there was a room, exterior to the city, and probably of later date than the bastion itself, which might be placed in Henry the Third's time. In the S.W. corner of the Quad, and east of this bastion, there were many mains of foundations of houses, and the original wall had been robbed of its stones to be used for other purposes and thinned down in many places. Another portion of a wall worked upon large stones, laid in a herring-bone fashion, was found commencing south of the main wall at a short distance from the east flank of the bastion; it runs in an easterly direction, almost in the direction of Hertford College, leaving little doubt that there is on this spot a double wall to the city. Besides clearing up the course of the city wall, the excavations were rich in discoveries of objects of minor interest. It is a pleasure to see the interest taken in their city by the members of this Society, and they are fortunate in having one who can record their proceedings in an attractive and readable manner.

"Buried Oxford Unearthed; Being Some Account of the Excavations Undertaken by the Oxford Architectural and Historical Society during August and September, 1899." By Fraser H. Penny, M.A. James Parker and Co., 27, Bond Street, Oxford, and 6, Southampton Street, Strand, London.

MODERN FARM BUILDINGS.

We are pleased to see that the demand for this excellent little book has made it imperative for the publishers to bring out another edition. Mr. Clarke knows about all there is worth knowing about farm buildings, and it is of inestimable service to have his experience set out in such a clear manner. To the land agent, surveyor, or architect engaged in such work, the book is a necessity. The great merit of the book lies in its strict attention to economy in building; in view of the keen foreign competition which English farmers and stock-keepers have to fight against, expensive additions or improvements to farm buildings are very seldom possible. The plans throughout the book are most clear and admirable—every detail seems to have been considered. This third edition has given the author opportunity to introduce information upon several matters which have recently engaged considerable attention. The various points in connection with the need for greater sanitary precautions being taken against the speading of tuberculosis and other diseases by the improved construction and management of cow-houses have been considered, and a reprint is given in an appendix of the "Model Regulations: Dairies, Cowsheds, and Milk Shops," recently issued by the Local Government Board for the guidance of local authorities. Chapters have been added on cottages, homesteads for small holdings, and iron and wood roofs, with a comparison of their cost and respective advantages for farming purposes; a short chapter on the subject of repairs and materials will also no doubt be much appreciated.

"Modern Farm Buildings: their Construction and Arrangement." By A Dudley Clark, F.S.I. Third edition. Price 6s. London: B. T. Batsford, 94, High Holborn, W.C.

Keystones.

A new Constitutional Club at Loughborough has been erected from the designs of Mr. W. T. Hampton.

Wrexham Church Restoration Fund has reached £4,000. The Duke of Westminster gives £2,000.

Change of Address.—Messrs. Woolliscroft and Sons, Ltd., of Hanley, Staffs., have changed their London address to 76A, Great Portland Street, Oxford Circus, W.

An Organ Recital was held at the Temple Church last week to celebrate the renovation of the famous organ built by Father Smith two centuries ago.

At St. Matthew's Church, Bankfoot, Perthshire, a stained-glass window has been placed in the north wall by Messrs. Powell Brothers, of Leeds.

Two Workmen were Killed last week by falling from the scaffold on which they were engaged in repairing the gashouse chimney at Wakefield prison.

Sir Richard Thorne Thorne, K.C.B., principal medical officer to the Local Government Board, died last week. He was born at Leamington in 1842.

The Old House in Golder's Hill Park is proposed to be turned into a temporary convalescent home for wounded soldiers. It will shortly become the property of the London County Council.

A new Liberal Club at Tranmere has been built from designs by Mr. T. Taliesin Rees, F.R.I.B.A., of Birkenhead. Messrs. John Lee and Son, of Bebington, were the contractors.

An Old City School—Lady Holle's School for Girls, Cripplegate, is shortly to be demolished by the London County Council, who have purchased the site for the purposes of a new fire station.

Aberdeen University is proposed to be extended to Queen Street. Taking into account the £20,000 of debt, it is estimated that the total cost of completing the scheme will be about £80,000.

The French Academy of Fine Arts has chosen M. Vallaury, architect of the Ottoman Government, at Constantinople, a former student of the École des Beaux Arts in Paris, as a corresponding member in the architectural section, to replace M. Vespignani, of Rome.

A Memorial for Canterbury.—A memorial to the officers and men of the 1st Battalion Buffs (East Kent Regiment), who fell in the Chitral and North-West Frontier Campaigns, is to be erected in the nave of Canterbury Cathedral and will be unveiled in January.

£23,000 for Four Pieces of Tapestry.—Four of the finest pieces of tapestry turned out by the celebrated Gobelins looms in the last century have just been purchased for £23,200 in Italy, and brought back to France by Dr. Henri de Rothschild, who will add them to his Paris collection. The pieces were gifts presented by Louis Quinze to the Marquis de Grimaldi, the then Spanish Prime Minister.

The War Fund Art Exhibition.—Some complications seem likely to arise over the proposed exhibition of works of art for the benefit of the War Fund. A committee of artists, with Mr. M. H. Spielmann as hon. secretary, has been formed to decide upon the best way of carrying out the scheme. But now it appears that Mr. Harry Quilter has been maturing a similar project, only on a larger scale, and he advocates his idea against what are presumed to be the intentions of the artists. It is a pity that there should be any division of opinion on such a subject, and it is to be hoped that there will be no attempt to organise two competing shows. Either the artists must give way to Mr. Quilter, who claims to have been first in the field, or Mr. Quilter must retire in the face of numbers. The exhibition most likely to secure the confidence of the public will be the one most worth carrying out.

M. Yveling-Rambaud, the French novelist, is dead. He was a prolific writer on modern art.

Belfast Engineering Works Gutted.—Messrs. Coombes' extensive engineering works at Belfast were gutted by fire last week. The damage, which is fully covered by insurance, is estimated at about £8,500.

The Salon of the Société des Artistes Français will open next year on April 7th, which is three weeks earlier than has been the case for many seasons past. The object is to prevent competition with the Exhibition.

The Royal Institute of Architects of Ireland held their annual meeting recently, the president, Mr. Thomas Drew, being in the chair. The muster roll now includes twenty-five fellows, sixty-three members, and six probationers.

The Collapse of a Floor at Finsbury.—During the inquest on the body of the workman who was killed in this accident (which we reported last week), evidence showed that it was the cutting away of a portion of the concrete foundation for the purpose of forming a drain trench that caused the supporting iron columns to fall, bringing the floor with them. The jury said they were unable to blame anyone.

A Poster Competition.—A competition for a poster is announced by the International Artistic Association in Rome (via Margutta, 54), whose president is A. Apolloni. Sketches are to be handed in by March 30th, and the prize is 1,500 francs in gold. The object of the poster is to make known the kind of articles Cav. Sangiorgi deals in, namely, tapestries, bronzes, statues, &c.

The accommodation at the Royal Courts of Justice is found to be inadequate for present needs; it is seventeen years since they were opened by the Queen. The Benchers of Lincoln's Inn have granted the use of their old hall as an "overflow" court for Mr. Justice Farewell in the New Year. The strip of land on the west side of the Law Courts, now laid out as a garden, was intended for future extensions, but it would seem a pity to build over such an excellent and much-desired open space.

Muirhead and Birkhill Drainage Scheme.—In the report which Mr. John Anderson, sanitary inspector, has drawn up in connection with this scheme it is stated that according to plans submitted in 1896 it was intended to have an outlet for each village. Since then the treatment of sewage has been modified and improved and only one outlet is now proposed, which is to be situated at the west end of the village of Muirhead. On the Dundee and Coupar Angus Road, along which runs the main sewer, there is a rise on the surface from the south end of Blairfield Road to near Pyotdykes Quarry, and to obtain a working gradient of 1 in 400 a forced level would require to be made, necessitating a cutting of considerable depth at the summit. Therefore, if the main sewer were diverted southward and formed through the cultivated fields, and then northward by Liff Road to the Dundee and Coupar Angus Road, the depth of the cutting would be greatly reduced. In addition to the extra cost to be incurred by forming sewers sufficient to carry surface water the disposal works would have to be increased. According to experience gained, sewage is more efficiently treated without the addition of storm and other surface water, the yield of sewage being practically constant, while the quantity of surface water was uncertain. Mr. Anderson suggests that the sewage should be treated near the outlet by the septic tank system. The first cost of the works under this system would be considerable, but the annual cost of maintenance would be greatly reduced by the introduction of alternating apparatus (automatic). Arrangements would also have to be made for discharging the effluent into the Dighty stream. The probable estimate Mr. Anderson puts down at—Erecting sewage works proper, £1,037; allowance for rock, say, £100; disposal works, £525—total, £1,662.

AMERICA AND THE FRENCH SCHOOL OF ARCHITECTURE.

THIS topic, which is scarcely less interesting to English than to American architects, formed the main subject for consideration at the thirty-third annual convention of the American Institute of Architects, held at Pittsburgh on November 14th, 1899. We give below *résumés* of two important papers read by Mr. Ralph Adams Cram and Mr. H. Langford Warren, both of Boston.

Mr. Cram's paper was on "The Influence of the French School on American Architecture." He said:—I cannot admit that we are considering a matter of absolutely revolutionary importance—the coming of the architectural revelation to an hungry and waiting world. We have had several new dispensations before; even I remember three of them very distinctly. There was the Queen Anne affair, and a few years later the episode of Romanesque, and still later the Colonial excitement. Each was hailed with an enthusiasm that rivalled that which acclaims the advent of the Parisian Renaissance. Each passed, and the drawing-boards that once knew them now know them no more. Is this to be the fate of the latest fashion that we have imported with our champagne and Easter millinery? There was much good accrued to us from each of the three architectural events of the post-centennial. The Queen Anne craze served the part of the swallow of salt water in the case of sea-sickness—it prepared the system. Romanesque gave us some idea of what vigour and power and honesty meant in our work. Colonial suggested to us the value of historical association—of ethnical continuity. And the Parisian Renaissance? I honestly think it will do more good than any of the others. But is it the last word in our architectural development? Is it the revelation of all truth, of the final and perfect style? I have seen the rise and fall of Queen Anne, of Romanesque, and of Colonial; I have lost my illusions; I hold it only an episode.

Yet it is an episode that has only begun—let us grant that. Thus far it has done much good and more harm; when its work is finished the good will have outweighed the evil. In time we shall come to discriminate between what is permanent and what is evanescent in the movement. On the one side we shall put the underlying principles of modern classicism—these are the lasting qualities; on the other side we shall put the style itself—this is the accident, the matter without vitality or moment. In a word, the motive is good, the style bad.

The advantage that thus far has accrued to us—and it is very great—is the sense of fundamental law, of a certain self-restraint, of the subordination of personality in radical things to something that is larger than the individual. With us architecture for a quarter of a century has been another name for æsthetic anarchy—every man for himself and the client take the hindermost. We have planned in the happy-go-lucky fashion that prevails in England, and with almost as unhappy results. We have had as little idea of the sanctity of style as the German designers of churches. Our architectural education has been primary, not even rudimentary. Now a reform has begun, and, like all reforms, it has overshot the mark. It tends to curb our frontier originality, to make us something but self-satisfied units, but in the flush of its popularity it tries to force the style with which it is associated, purely by accident, as the one and only style that righteous men can employ.

This is the phase of the new *régime* that I must protest against, and not against the big principles of planning, composition, and design, not even the methods of teaching these, but against the narrow enthusiasm that confuses a cheap and facile style with principles that are really fundamental. If the advocates of the new school would only take their stand on the really unassailable principles that drive them, instead of on the casual style that happens to be associated with them for the moment, there could be no chance for a quarrel.

It is unfortunate, in a way, that this most salutary movement should be linked with a style so limited, and so, shall I say, superficial. Still, it is hard to see how else it could have come except in this company. France is the only European country where there is a logical system of training, and France has preserved the style of the Renaissance with more vitality than it has been elsewhere. In England, Germany, America, it was quite dead, though unfortunately unburied. The new scholasticism has made it thoroughly living in France, and already it has been galvanised into life in this country. But was it really worth this? Living it is, but is it not the fictitious vitality of a style that has steadily degenerated since the sixteenth century?

M. Taine once said: "There are but two orders of architecture—Greek and Gothic—all else is imitation," and certainly no one claims that the developments of the Classic style from the days of the Parthenon down to those of M. Garnier's Opera House have added anything of essential value to the primal type; it has been imitation and—degradation, so far as the great principles of building are concerned. By "degradation" I do not necessarily imply a reproach to the style; indeed, the word is a measure of praise, for it shows that architecture has performed its just function, and has adapted itself delicately to the changing conditions of civilisation. Architecture is good if it expresses the time and the people and the spirit that made it possible; it is bad if it is an affectation. Really, I suppose we have less concern with the relative perfection of the style itself than we have with its fitness. The Parisian Renaissance of the boulevards is better architecture than would be the Doric of Greece were it restored on the Champs Elysées, or the Gothic of Isle de France on the Rue de Rivoli, and yet, in the abstract, as they will appear in the architectural histories of a century hence, the Greek and the Gothic are good, the Renaissance bad.

So, after all, it is worse than useless to dispute as to whether Parisian Renaissance is really a good style or a bad—for France. It is inevitable, it expresses the time and the people and the thing they are pleased to call civilisation, therefore it is a thousand times more respectable than the archæological Gothic of the thirteenth century pasted over the outside of English law-courts, or the barbaric solemnities of the Auvergne when they try to express nineteenth-century Protestantism.

Let us grant this; let us confess that architecture in France is living, and that the style is just as appropriate to the time as was Doric to that of Pericles; what then? Is there any reason why we should seize upon it and force it on our own civilization? If not wherein is the cult of the École any less affected than we who borrow a style for church building from another land? Are they not dealing with an alien style? Or have we something in this country, some phase of life, some method of thought, that demands the architectural language of Republican France for its fullest expression? Yes, we have, and that very fact justifies Parisian Renaissance—just so far, but not an inch farther.

I have already referred to the great principles of design that underlie modern architecture in France; it is unnecessary to specify them or to urge their acceptance. We all admit them. By this I do not mean that we admit all the *methods* used in France to inculcate them; but that is another story, and one not to be touched on here. The principles themselves we are all anxious to adopt; they are exactly as operative in the planning of a Gothic cathedral as they are in the laying out of a scheme of a palace for the President of the French Republic. These principles are independent of style. But the style itself? Here is the ground of contest? Why in Heaven's name should we take it if we do not want it, and if it does not fit our case? It is not particularly beautiful, and it *is* thoroughly French; besides, it is about as narrow and as limited as any. There are certain things it cannot express, certain places where it would be an egregious offence, just as fifteenth century Gothic would be an offence in a fire-engine house or a Turkish bath.

We read history and we realise that always in the past one style has been enough for any given time and people, and recognising the implied reproach on our own epoch, when this condition does not seem to hold, we hunger for some one style which shall be for us the one, inevitable thing. This I believe to be absolutely, though not necessarily forever, impossible. Architecture, if it is real, must be accurately expressive of the impulses that create it. Well, we have now not one impulse, but a hundred. Once life was a thing of unity; Church and State, industry and commerce, society and recreation were united in a whole that seemed insoluble. This condition exists no longer. Life is coming to be as various almost as the units that compose society; there is no longer unity or identity. Can we conceive of an architectural style that should express all? Certainly not; any attempt to evolve or import one is vain; any style that tries to perform this function is affected and in the end ridiculous. I do not apply this criticism to the latest fashion alone; it is quite as valid in the case of Gothic or Romanesque or Colonial or any other style of history. When society was a unit art was instinctive; it was the language of a people—not, as now, the thousand dialects of antagonistic cliques. Whoever tries to establish a universal style, or delude himself into the belief that such can be achieved, looks at architecture as a thing not as a condition. Self-conscious we must be; it is our destiny, the penalty we pay for the peculiar kind of civilisation that pleases us for the moment. We are utterly unable to create art instinctively, and the sooner we recognise this the better for art and ourselves.

Just here lies, I firmly believe, the vital error of the advocates of Parisian Renaissance. They try to force an alien style on us for all our uses, when really it fits only a few of them. On second thoughts, this is not quite just; they realise that where churches are concerned their style is quite absurd; therefore, since the style *must* be right and sufficient, churches are an anomaly and must be ignored. There is something wrong here. The frivolous Renaissance of the *ateliers* is recognised as impossible, therefore it cannot possibly be a vital, national, universal style; a return to historic periods is necessary, but then what becomes of all the boasted fundamental laws that should make good work inevitable, whatever the chosen style? The system has been tested and it has failed. For the leaders and followers of the Parisian Renaissance cannot, ostrich-like, thrust their heads in the sand and so obliterate religion. The Church is, and must be, counted with. It is also certain that with the exception of medium-cost dwellings there is no opportunity more common. But the French school of American architects is driven to the curious position of having to deny both these things for the simple reason that the style they affect is not cognisant of Christianity.

And if it is true that the new fashion is powerless before the church, so is it true that it has little excuse in some other places. As I understand it, it is a style purely French, or, rather, purely Parisian; it fits Gallic civilisation like a glove, and so it is good—in France. But we are English by blood, and we do not think in French ways, neither do we altogether act in them. Why, then, is it any less affected for us to import a style from Paris than from England? Why is Parisian Renaissance a more logical form of architecture than English Gothic? Because it is nineteenth century? So is English Gothic—now. The classic of Napoleon's time was pretty dead, as dead as Gothic in England under the Hanoverian Georges. It is vital now; so is Gothic, just exactly as living and spontaneous and contemporary as Parisian Renaissance. It is not a case of living styles, one of which is French, one English.

Do not think that I advocate either the one or the other exclusively. If we are English by blood and sympathy, we are French by perversity, and all must be expressed. There is much in our society that can better be expressed through the French style than any other; there is much in our civil life, our political life, that might as well use this form of expression as any; all are too good for it, even modern German or English commercial architectures, but there is a lot, and that the very best we have, that has no more kinship with the pleasing conceits of the boulevards than it has with Norman Romanesque or the Buddhist architecture of Japan. In these directions, I humbly submit, Parisian Renaissance, *as a style,* meets with the sign "*rue barrée.*"

And what shall assume its place? Just whatever style seems best to fit the power that gives the impulse. Is it the Church? There the answer is the splendid Gothic that Bodley, Sedding, and Austin and Paley, and their scores of associates have restored to life and vigor. Is it higher education, the education of colleges and universities? The answer is the same. We are English; neither French nor Italian; therefore, let us not sell our birthright for a mess of—*potage du jour!* As for our commercial work, we are working that out all right as it is; it demands a new style and we are achieving it, but not by way of the École; rather by obeying the dictates of common sense.

All hopes of a single style are vain. What our civilisation is, that must our art be also, and our civilisation is as various as our population.

To recapitulate, then, the influence of the French school is good just so long as it is the influence of solid and lasting principles of planning, of composition, of design; so long as it insists on vitality and modernism instead of archæological erudition; so long as it demands subservience to law and order; so long, in a word, as it deals with fundamentals. It is evil when it confuses an accident of fashion and *locale* with the things that really matter; when it binds itself to the latest vagary of French fancy; when it affects to despise the Church and her architecture, and to look on Gothic as a barbaric episode; when it tries to force on a branch of the Anglo-Saxon race for all its purposes, a style that is Gallic in its impulse, evanescent in its nature.

It is this ill-advised and, I am convinced, unjustified fanaticism for a certain accidental mode against which I continually protest; it is the mistaken view of a great system of education which I regret to see introduced into our architectural schools, not the fundamental system itself. Ruskin was a bigot, and he made himself absurd by his frantic advocacy of certain forms of architecture; frankly, I think some of these who now most strenuously uphold exactly what he with equal vigour denied are laying themselves open to the same condemnation. Above all things, let us have —in architecture—no bigotry. Let us look at the thing sensibly and in cold blood, allowing ourselves to be led away by no tempests of fanaticism. We want architecture that will be logical and national, and expressive of the agency that calls it into being. We cannot create a style, for we have not finished creating a civilisation as yet, and that must come first, but we have various powers or agencies that exist more or less independently of national civilisation and are not consequent upon it.

Mr. H. Langford Warren dealt with "The Influence of France upon American Architecture." He said:—From the days of the Revolution, when the support of Lafayette and his followers brought the two countries into close relations of friendship, the influence of French architecture has been a factor in our architectural development—or in the changes from which until lately we may be said to have suffered. To discuss it fully would require us to consider the story of our architecture during the present century, as well as that of France. It is, nevertheless, only within the past thirty years, or thereabouts, that French influence upon American architecture has counted for much, and it is a still briefer period since it has anywhere in the country shown signs of predominance.

At the beginning of the century the architecture of this country was still for the most part in the hands of simple craftsmen who were carrying on the traditions of the Colonial period. But the loss of traditional skill among the craftsmen themselves and the rival and confusing claims of Greek and Gothic revivals, rapidly produced that condition of chaos and entire absence of wholesome tradition, which made the advent of the educated and professionally trained architect the only way out.

American architecture suffered grievously during more than the first half of this century through the want of properly trained practitioners. In the main, after about 1820, the succession of architectural fashions showed a ghastly parody of the work going on at the same time in England—work, some of it, weak enough in itself. During this period appear the names of a few French architects. At the beginning of the century their work did not differ essentially from that of the English architects who found their way hither or from the few educated Americans, for at this time Roman classicism (variously understood) reigned everywhere, and as long as it continued exercised a wholesome restraining influence. In the chaotic days of the forties, fifties and sixties French names very rarely appear, and the only marked evidence of French influence was in the advent of the so-called French roofs, which appeared for the first time, we believe, in the Deacon House, in Boston, built about 1850, the work of a French architect named Le Moulnier. The American builders of those days were sure to make ridiculous even their attempt to imitate good things; but this somewhat unreasonable contrivance, aided by the jig-saw, became in their hands the source of more ugliness than even America has otherwise seen.

Into this chaos gradually and in increasing numbers came, during the sixties and seventies, the educated architects. They came from two main sources. On the one hand from England, or under more or less direct English influence, partly by the immigration of Englishmen trained in the ideals of the English Gothic Revival, partly they were Americans who in English offices or through travel had received a similar training. The second source was France, and this influence was brought to us directly at this time by Richard M. Hunt, who received his education at the École des Beaux-Arts. In 1867 the department of architecture at the Massachusetts Institute of Technology was opened under the direction of Professor Ware, and the scheme of instruction was frankly based on that of the Paris school, adapted to meet the very different circumstances and requirements. In 1871 M. Eugène Létang came from Paris to take charge, under Mr. Ware, of the work in design. Since then every important school of architecture that has been founded in America has sooner or later followed, more of less closely, the same model. Indeed it may be said to be all but universally acknowledged that the French system of instruction in architecture is the best in the world. Meanwhile an ever increasing number of Americans have been educated in the French school itself.

Great changes have recently taken place in France itself, changes of which it is essential we should take account in forming an opinion as to the value of French influence at this moment. In spite of its fine qualities, almost unrivalled in the modern world, there has been constantly apparent in French architecture, since the time of Louis XIV., a note of extravagance, of theatrical display, of redundant, and sometimes tasteless, ornament, which has frequently injured some of its finest productions; but there have nearly always been men like Labroust, Daumet, Vaudremer, who have by precept and example, set their faces against this extravagance. But the wave of indiscriminate admiration of the vagaries and vulgarities of Rococo architecture, which has of late swept over the civilised world like a plague, has made itself felt nowhere more strongly than in Paris, and the mad craze of novelty for the sake of novelty has run riot in an extravagance of *hautes nouveautés* is enough to make Labroust and even André turn in their graves. The designs for the forthcoming Paris Exposition, which, magnificent as it is in conception and general composition, are producing structures almost delirious in their unreasonable and wanton ugliness. There are, of course, men still doing superb work, and the sound traditions of French training still make themselves felt amid all the extravagance and vulgar search for the merely novel—miscalled originality. But the main tone of French work at this moment, the main trend of taste at the École, has sadly changed since the *ateliers* of André and of Vaudremer, at opposite ends of the scale, were typical. This change, like every phase of human development, is expressive of the condition of the community that produced it. The want of sane, wholesome life, of high and pure and sweet ideals has its inevitable effect on taste in the fine arts. The jaded and sated palate calls for some new sensation, and the result is all the more deplorable because of evident ability and training prostituted.

The training of the École des Beaux-Arts, shaken though it had been by the Neo-Greek movement of the middle of the century, and, in spite of extravagance, which already showed itself, was still, even twenty years ago, synonymous with the somewhat rigid traditional Classicism which had been so powerfully inveighed against by Viollet-le-Duc. Cold and unsympathetic as it sometimes was, it had at any rate this advantage: that it tended to curb the growing tendency to license, and that it was a safe medium for instruction in the fundamental principles of architecture. New forms and modifications were looked at somewhat askance, and were only gradually admitted, as it were, to recognised standing. It was somewhat unyielding, and its notion of correctness of style was still mainly a matter of tradition. But what then, as now, constituted the strength of French training and practice was its insistence on composition, its excellence of proportion and mass, and, above all, its splendid mastery of monumental planning. It taught careful consideration of fenestration, the study of light and shade, the effective placing of ornament, and showed that rhythmic proportion has relation to all these. It insisted that a building must tell its story; that it must be expressive of its purpose, and that the exterior must be expressive of the interior arrangement, of the plan, which is the key to the whole composition. Interior and exterior, plan and elevation, must work together to produce one organic and rhythmically connected whole. In insisting upon these things, it was teaching that architectural design depends, not upon caprice, but upon principle, and it gave, up to a certain point, some understanding of what these principles are. In doing all this it inculcated, though perhaps not always clearly, the fundamental laws upon which good architecture, upon which fine art of every description, have always depended and always will depend. And it taught and still teaches what, perhaps, after all, is for the impatient American the most important lesson, that good results in the fine arts are only to be attained, in the first place, by long and patient and severe training; and, in the next, by equally patient and painstaking study and restudy of each problem as it arises. On the other hand, the principles taught seemed to stop at the ornament, as if the smallest part of any work of art could be subject to any other laws than those that must govern the whole, or as if one part must be a matter of principle while another could be a matter of mere tradition or of caprice. The ornament —most of the detail, in fact—though often carefully studied and always delicately executed, was apt to be either meaningless and extravagant or coldly traditional in its form.

Moreover, the training of the École, while thorough along its chosen lines, was narrow, so that those brought up exclusively under its influence were generally strangely ignorant of all forms of architecture except those which were traditional within the school. They had made no adequate study of the historic styles, and so had no understanding or appreciation of the way in which the immutable principles of design expressed themselves in other forms and under other conditions. Their experience was so narrow that the laws of design could not be thoroughly appreciated as the result of principle, and these laws thus became in their hands little more than a set of academic formulæ. The designs produced and the judgment formed were alike too apt to be the mere conventional result of conventional rules, the reasons for which were but dimly apprehended.

The inevitable revolt against this rigidity grew apace, and the reaction under existing conditions in France has led to that license of design which we have already characterised. The fundamental laws of composition are still taught as before, but originality, so called —mere capricious novelty—has become the standard rather than beauty and reasonableness. Its ideals are no longer those of purity and of expressiveness of architectural form, but of novelty. Expressiveness of a kind is indeed aimed at, but it takes the unimaginative form of, for instance, ornamenting the exterior of an army and navy building with cannon-balls, gun cartridges and conning towers, put on without the slightest regard to the architectural purpose of the parts to which they are applied.

If there is one thing that the American public has needed for the improvement of its taste in art, it is to be taught that there is something better than novelty and change; that what is beautiful and reasonable is the ideal to be aimed at, not to be "up-to-date" or "in fashion." It needs to be taught that the finest things in art are usually the simplest—those things which at first sight seem easiest, most obvious, most natural—not those things which by their overloaded ornament, their *bizarrerie*, their theatrical posturing cry out for attention. We need to appreciate that those qualities which make fine manners also make fine art—restraint, repose, naturalness, graciousness. We have been learning these things, but are not helped forward by indiscriminate admiration of this latest and least admirable phase of French art. It is curious that those who are loudest in its praise are those who least of all show signs of putting one of the chief precepts of its doctrine into practice in this country. This doctrine teaches, and rightly teaches, that a country can have a vital art only in so far as it solves its own problems in its own way, expressing freely its own ideals in meeting its own wants. The art of France is held up to admiration as being such a vital art. This is to a degree true, and that art expresses French ideals, French taste—and also French depravity. Now we do not take a single step towards producing an art of our own by a direct importation in all its details of the forms of French architecture, which have nothing whatever to do with the principles taught in the French school, but are the mere accidents of environment. On the contrary, whatever beginnings of vital work that are found in our midst are strangled by such direct imitation. The French style meets our wants most nearly, it is argued, because it is the most modern. This is manifestly a *non sequitur*.

What we need is to understand more and more fully those fundamental principles of our art which underlie the best work of all times and all styles; to understand and know thoroughly the architectural forms of the past, and appreciate how in them these principles were expressed; to use these forms in our own work freely, varying from them not capriciously, but according to principle, as changed conditions, changed modes of construction, changed ideals seem to require. Working in this way, the modifications which come will not be forced, but natural, and will have that quality of inevitableness which is inseparable from vital work, and is one of its greatest charms.

We have learned much from France, and yet have much to learn; but let us not take from her indiscriminately. In so far as the French influence helps us to sound methods of education; in so far as it teaches us composition, monumental planning, the importance of balance and proportion in plan and mass; as it leads us to regard our buildings as organic unities, and to make exterior and interior hold together as rhythmical component parts of one whole; as it leads to careful consideration of fenestration, of light and shade, and of scale relations; as it discourages hasty and slipshod and ill-studied work; in so far, in short, as it helps us to principles and to devoted and painstaking study, its influence has been, and will be, helpful and wholesome. But in so far as it leads us to mere copyism of the externals of recent French buildings; in so far as it leads us to seek novelty in place of excellence; in so far as it encourages a taste for extravagant and overloaded ornamentation, and tends to destroy delight in simple and quiet work—in so far as it does these things, the French influence is deeply to be deplored.

THE LIGHTING OF ROOMS.

A GOODLY part of the usefulness of a house comes at night, for it is then that hosts most generally throw open their doors; hence the problem of artificial lighting becomes a very important one. Many houses are ruined by bad lighting, some having too much and others too little light. Fortunately, as it happens, one simple rule rigidly adhered to will solve many difficulties. The lights should never be so arranged as to shine directly in anyone's eyes, and for this reason the lights should be low and well shaded. In reading, the light should never be more than a foot, at the most, higher than the eye, and it should be so shaded that not a ray can fall directly upon the eye itself, but only in a full flood upon the object engaging one's attention. As to the other lights in the room, they need not be placed quite so low as the reading lamp or light, although for decorative purposes it is generally better not to place them too high. But from whatever height it comes, the light should meet the eye softened by glass, china, silk, or paper. Comfort absolutely demands the shaded light, and so does decorative beauty, and really the shades of the lights provide the easiest means of successfully introducing colour into any scheme of decoration. Though lights of various colours can be used, the best effect is, perhaps, obtained by having all the lights in the room of a similar colour. A drawing-room provided with pink lights looks well; red and yellow are also good colours. A library papered in green, with white woodwork, looks peculiarly restful and studious with the somewhat old-fashioned white-lined green shades on the reading lamps. Blue and most greens are to be avoided, as they are apt to give the persons in the room a ghastly appearance. When a ring of gas jets near the ceiling are lighted the whole room looks barren, the ceiling itself becomes the most prominent feature of the apartment and its bare expanse dominates the whole place. But if the lights are put down a little lower, a great improvement will be noticed. There are, of course exceptions — a ballroom for example: here the hard brilliancy of uncovered lights is exactly what is needed. The methods employed for reflecting light from ceilings and walls are too numerous and in some cases, too complex to be dealt with here.

W. N. B.

The Grosvenor Hotel, London, which was recently purchased by the Brighton Railway Company, will be opened next season under the administration of the "Gordon Hotels, Limited." Important structural alterations, involving the closing of the hotel for three or four months, will be immediately undertaken, under the supervision of Mr. Alfred Waterhouse, R.A., and Mr. Morgan, the Brighton Company's engineer.

British Art at the Paris Exhibition.—The space allotted for British works of art executed since May 1st, 1889, consists of three rooms and part of a corridor in the new Palace of Fine Art. These rooms afford 466ft. run of wall space available for hanging paintings, drawings, &c. Sculpture of all nationalities will be distributed throughout the building at the discretion of the French authorities. Works of art will also be exhibited in the British pavilion on the Quai d'Orsay, but the Royal Commission have decided to reserve this building mainly for the display of works by old masters of the British school.

Bricks and Mortar.

Aphorism for the Week.

"The key to a work of art is the man himself, his habits, his whole way of regarding life. To fathom the meaning of a picture of Leonardo one has to recall the dreamer and the poet—the intellectual exquisite, the man of extreme physical beauty; the austerity of Inigo Jones's architecture is better understood when one realises the stiff, unbending nature of the man, that proud, masterful temper which earned the undying hatred of Ben Jonson. So, too, with Wren, his easy, kindly nature is written in his work."—Reginald Blomfield.

Our Inset Sheets. The house at Newark has been erected for Mr. Oliver Quibell, and contains dining room, drawing room, and morning room, with sitting hall, together with the usual kitchen offices and outbuildings. The exterior is constructed of red sand brick and the upper portion of cement rough-cast, the roof being covered with red tiles. The cornice is constructed of wood, and, with the rest of the exterior woodwork, is painted white. The work has been carried out by Mr. William Smith, builder, of Newark, from designs by Messrs. Brewill and Baily, architects, of Nottingham and Newark.—The stables at Lingfield were erected in two sections. The portion to the left of the archway was first erected as a stable complete in itself; shortly afterwards, the coachhouse and additional stable accommodation were added. The materials used are red brick for the lower portion, rough timbering and plaster for the upper part, and tiles for the roof, with local stone for the dressings, &c., to the archway. Mr. Ernest Runtz, of 10, Walbrook, E.C., was the architect.—With regard to the lodge in North Wales, designed by Mr. Herbert L. North, B.A., architect, for R. Norton, Esq., the walling is of local coarse granite, the natural surfaces being of an orange tint and the cut surfaces blue-gray. The arches and verges are of Buckley dark brindled brick and Buckby lapped ridge tiles were used for the roof. The mullions to the windows and chimney cap are of Penman crystaline limestone. The slates are small third quality, violet and green mixed. There are three good bedrooms. Mr. Evan Humphreys, of Llanfairfechan, was the builder.—The house at Walton-on-Thames was designed by Messrs. Niven and Wigglesworth, of London. The walls are of red brick, the upper story tile-hung and cemented, and the roof tiled.—"Fairyhill," Weybridge, was recently built also from designs by Messrs. Niven and Wigglesworth, of London. The walls are of red brick, and the roof is tiled.

Vandalism in Cyprus. The two chief cities of Cyprus, Famagusta and Rhodes, contain examples of the very finest Gothic architecture in their old cathedrals, churches, palaces, fortifications, which are most rapidly being destroyed. Famagusta is fast disappearing; Port Said may be said to be built out of its stones, carried across to Egypt in little two-masted lighters at a very profitable rate. The priceless old carvings of angels, saints, lions, and what not, are roughly knocked off to render the stones square. The more complete destruction of the city is now contemplated. It is proposed to build a small harbour for coasting steamers within the shallow rocky port of ancient times. To effect this the great walls of the city, which still stand in the most perfect preservation as if abandoned but yesterday by the martyred Bragadino and his brave companions of 330 years ago, are to be utilised; their materials are to be taken for the purpose of forming a new quay wall for the tramway to run upon and of connecting the landing-stage beyond the northern extremity of the city with the village of Varosha, which lies about a mile and a half to the south. From this latter a tramway to Nicosia is to be commenced. It seems a terrible evidence of poverty, both material and sentimental, that a country like Cyprus should be unable to afford to retain such a marvellous mediæval monument as the old city of Famagusta, a possession which in the future must certainly attract the art-loving tourist and the artist.

The Metropolitan Tabernacle.

A hope had been entertained that the rebuilding of the Metropolitan Tabernacle would have been completed some months ago, but it was not realised, owing to the inability of the contractors to obtain the great iron ribs on which the roof is to be raised. The delay caused the building committee much disappointment. Though at the time the contract was entered into the firm concerned could not give any guarantee as to delivery within a specified period, they promised to forward the girders with as much expedition as possible; but the conditions of the iron trade prevented them from sending more than a portion of the whole. The contractors are only waiting the placing of all the girders in position and the roofing-in of the building to finish the other branches of the work. These are now in an advanced stage. The two galleries that run round the building, with their separate staircases, are practically finished. The concrete bed on which the wooden flooring of the auditorium will rest has been laid, as much of the plastering as it has been possible to proceed with has been done, and, substantially, the whole of the woodwork has been prepared. Every possible precaution has been and is being taken against another fire. The flooring and staircases throughout the building have been built of concrete, and the roof will be made of the same material. Steel, also, is being substituted for wood, wherever practicable. It is hoped that, at the very latest, the building will be ready by June next. But before the opening service can be held, a further sum of about £5,000 must be raised, the congregation being pledged not to open the Tabernacle until it is absolutely free from debt. The entire cost of rebuilding the Tabernacle and the Lower Hall will be £44,576, of which all but this £5,000 has been obtained.

"Fireproof" Floors that are not Fireproof.

There is nothing like a careful experiment for finding out the quality of anything; and this is what has been carried out by the British Fire Prevention Committee with a floor (10ft. by 10ft.) similar to that described by the Metropolitan Building Act as "fire-resisting." After a fire test of less than an hour and a half, during which time the maximum temperature reached was about 1,700deg. Fahr., the floor collapsed. The composition of the concrete used was exactly as defined by the London County Council in March last and the most favourable form of joist—the steel joist—was applied; and yet this so-called fireproof floor failed. When so many buildings constructed on the latest principles have been entirely gutted by fires, the plea that planning and means of escape should be the primary consideration cannot be too urgently supported. At the same time the production of floors or stairs that are really fireproof is a great need, and one which does not as yet appear to have been supplied, despite the fact that the patents dealing with the matter are multitudinous.

New Law Courts for Leeds.

There is considerable need of extra accommodation for departments of the Leeds Corporation and the city justices at the Town Hall, and it is probable that ere long steps will be taken to remedy the deficiency. There seems to be only one course open: the removal of the Law Courts from the Town Hall. The provision of an eligible site for new Law Courts would in all probability involve an extensive improvement. New Law Courts should of course have a central position, with ample space around them. Such a site is not now available, and it would have to be provided by the demolition of other property. It has been suggested that the best course is the acquisition of the property on the southern side of Victoria Square, as far back as the southern side of South Parade, the frontage extending from East Parade to Park Square. Some members of the Corporation are in favour of even a bolder step, viz., the clearing away of the whole of the block of which that property forms a part—that is to say, the block bounded by East Parade, King Street, Park Square, and Victoria Square. That would make feasible an improvement, the like of which has not been made in Leeds—a great open space in the heart of the city, which might have for part of its adornment new law courts and one or two other institutions which could be named. It is roughly computed that the clearing away of this extensive block would entail an expenditure of not less than a quarter of a million, and that the erection of the buildings and laying out of the open space would cost as much more.

Interior Decoration.

"Domestic Interiors" was the subject of a lecture delivered on December 19th before the Architectural Association of Ireland (Mr. George Sheridan, the president, in the chair) by Mr. R. Caulfield Orpen, B.A., past president. His remarks dealt with comfort as regards planning, decoration, and furnishing of the homes of men of moderate means. Comfort, both mental and physical, should be the initial principle. He deplored the extravagancies for which ladies are chiefly to blame, which compels us to fill our rooms with "modern antiques," individually beautiful, but not making for comfort. More absurd, however, was the affected simplicity of interior treatment, which had taken hold of the younger architects of to-day, and the lecturer sketched a room of this type with hooded ingle nook, panelled walls, exposed ceiling beams, &c., and asked how such a room could be furnished as a home without grotesque anachronism.

The Hippodrome.

The latest addition to the pleasure houses of London is the Hippodrome, which has been built in Charing Cross Road, from Mr. Frank Matcham's designs, close to Mr. Wyndham's new theatre. The ring has a colander bottom, which, when the horsemanship is over, will be sunk, and 57,000 gallons of water will well up for the water scenes. As it gushes up from the fountains, coloured lights thrown down from the roof will play on the splashing water and give a glimpse of fairyland. Further ahead and on a level with the water surface is the stage proper, separated from the ring by the conventional curtain. The private boxes go round the entire building, but what strikes one as the novelty of the building is the position of the orchestra, which will be situated in a sort of Royal box on the right of the stage on the first tier. Lighting is effected by four hammered-brass chandeliers, each pendant forming the corner of a square. Each chandelier will have forty lights of 16-candle power. The roof, moreover, has a circle of perforations, through which glass dishes, bearing more lights, will depend. Each private box (there are about twenty) will have its own illuminant—an electric light shaded by a little glass curtain. The curtain is flanked by gold. Gold, again, are the great chandeliers. Gold is on the great shell backing the orchestra. Cream and gold is the scheme of the garniture. Finally, there is the horse's head in stone, forming the culminating point of the ring.

An Ancient Border Church.

Considerable interest has been evoked in the border country around Carlisle by the final completion of the restoration—almost rebuilding—of Kirkbride Church, eight miles from Silloth. The church was erected some 500 years before the Norman Conquest on the site of a preaching station of the Scoto-Irish missionaries, who first of all promulgated Christianity in these northern parts. There are many signs of their presence in this part of the kingdom. Fifteen miles south-west is the church of Bridekirk, and nine miles north (in Scotland) there is the village of Brydekirk—all suggesting the dedicational name of St. Bride. For two hundred years the state of the fabric has been unsatisfactory, until the last rector, the Rev. J. Whiteside, undertook its preservation in 1895. He completed the chancel in a very effective style. When the Rev. W. R. Hopper, late curate of Heversham, became rector in 1896, he first of all paid off the debt on the chancel of upwards of £100 and then proceeded with the more serious undertaking of the nave. This has now been finished and the church has been reopened. In all the cost has been £900, towards which £800 has been collected. The church was built originally out of the materials of a Roman Camp on the spot, and in the time of the Border raids it was a fortress-church. The massive walls bear witness to its strength, and in the recent restoration a long recess was found in the south wall where a huge bar of iron went across the door and secured the inhabitants in the case of one of the numerous Border raids.

Yatton Church.

Travellers by the Great Western Railway between Bristol and Exeter cannot fail to have noticed the quaint tower and stunted spire of Yatton Church. The unfinished tower of the noble church of St. Mary Redcliffe, near Bristol station, once bore a resemblance to that at Yatton. St. Mary Redcliffe, however, has been spoiled by the addition of a lofty and pretentious spire, and there appears to be possible danger that Yatton may share the same fate after the lapse of five centuries. Its stunted spire has become very dilapidated, the stones have shifted, and daylight is visible between them on account of the mortar having fallen out. For Fifteenth Century work it would appear to have been bad masonry. The upper portion of the stair turret at the side of the tower is also demoralised and in places tower and turret have parted company. Mr. Buckle, the diocesan architect, from whose report these statements are taken, states that the dwarf spire must be taken down and rebuilt and the turret and adjacent portions repaired and strengthened. As to whether the spire is to be exactly reproduced or carried up to a lofty point, as the architect thinks was the original intention, Mr. Buckle points out that the present outline presents some beauty and gives a unique appearance to the church, and he is in favour of its reproduction. The tower was commenced in 1455, but when it was finished, or whether it was left unfinished, records do not show. That there was evidently something amiss is plain from the fact that between 1491 and 1563 the tower had been "pointed" no less than four times. It will cost about £1,100 to carry out the necessary repairs, and if Church people make haste to send that amount to the vicar, the Rev. J. Harrison, on condition that the present character of the tower be retained, they will help to preserve one of the most interesting landmarks in Somerset.

Finsbury Circus—New and Old.

There are a great many alterations being made in Finsbury Circus, which, built on the very confines of the City about the beginning of the century. It has hitherto worn a curiously suburban aspect, little altered by the fact that private residents have long since been ousted by solicitors and surveyors and an odd crowd of miscellaneous agents, and by the circumstance that even the basement rooms, once kitchens looking out upon still existent areas, have been converted into offices. Now, however, the south-western quarter of the Circus has been pulled down and a great clearance effected as far as London Wall. The remaining portions are to share the same fate. There are also being demolished two other buildings close by—the Ophthalmic Hospital and its next-door neighbour in Blomfield Street, the Roman Catholic Church of St. Mary Moorfields, consecrated in 1820. Stuccoed and white-painted without, it greatly resembles one of Wren's usual City Renaissance churches within. The east end of the church is remarkable—or was, for it is now in process of demolition—for a very effective altar-piece representing the Crucifixion, lighted from above.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

PRICES OF BOOKS.

Arundel, Sussex.—In reply to J. W. M., the published price of Mitchell's "Advanced Building Construction" is 5s. 6d., Mitchell's "Forty Plates on Building Construction" 10s. 6d., and of Stephenson's "Estimating" is 6s. 6d. These books are all published by Mr. B. T. Batsford of 94, High Holborn, W.C.

MENSURATION BOOKS.

Colchester.—Z. Y. X. writes: — "What books are published on mensuration; and which do you consider to be the best practical one for an architect's use?

Few architects require in their practice to know more of mensuration than is contained in the "Mensuration Rules" given in the "Surveyor" section of "Specification," on p. 65 of No. IV.; this is obtainable from these offices, price 5s. Todhunter's work on the subject might be consulted if anything further is needed. G. A. T. M.

SOUTH AFRICAN APPOINTMENTS.

Leicester.—J. J. writes:—"I shall be glad if you will kindly advise me as to how to obtain berths in South Africa. I am a builder's manager, and should like to get out there. Please also state any difficulties to an Englishman in that country. Of course, I mean when the present war is completed."

It is practically impossible to give a satisfactory reply to this query until the war is over, for matters which now have one aspect may then have a totally different one. J. J. had therefore better wait a little and see how events turn out.

MEASURING AND PRICING ARCHES.

Leeds. — A. McK. writes: — "Will you kindly give me the rule for measuring a brick arch the full thickness of wall for a warehouse? Should such an arch, say, rubbed and gauged elliptic or segmental axed, be measured on the internal face in addition to the external face and soffit, and, if so, should the internal face be paid for at the same rate as the remainder of the arch? I have several works on quantities, but none seem to define this point."

If the internal face is finished the same as the external, it should be measured and priced the same, but it is not usual to have gauged work on the interior of a warehouse.

HENRY ADAMS.

ALTERATION WORK.

Blackpool.—E. S. E. writes:—"In alterations the pilasters of a shop front are kept low in order to allow a through first-floor sill course. Contractor does not give sufficient projection in head, but otherwise works to drawings. The result is that the pilasters appear insignificant compared with those adjoining and the proprietor, without consulting as to cost, &c., orders new ones. He now says that he ought not to have to pay for them, as the fault lay originally with the architect and then with the contractor for making what he knew would not be satisfactory. Has the proprietor any right to expect concessions as to price from either the architect or the builder?"

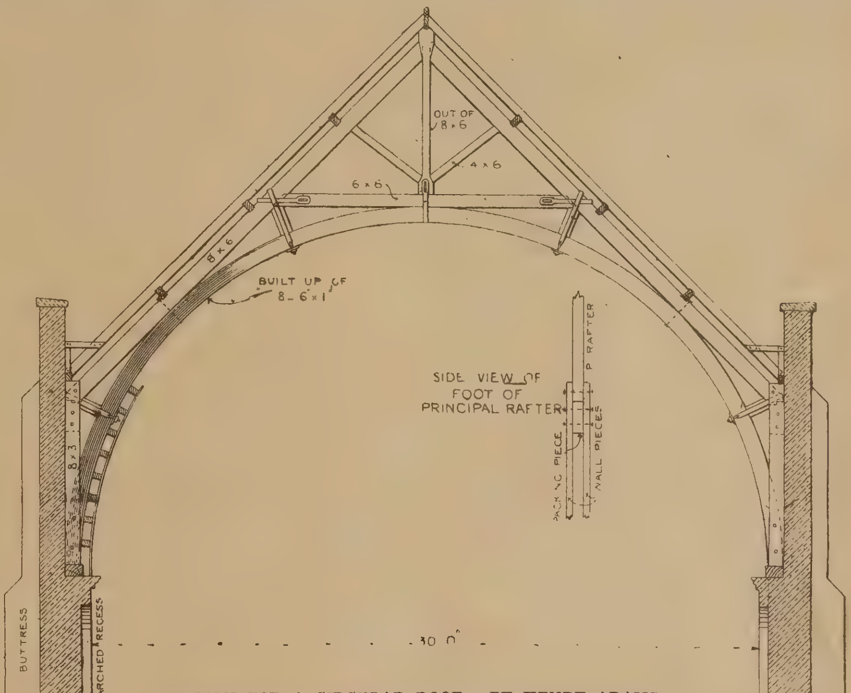
If the contractor failed to work to the drawings, and so caused the proportion in head to be insufficient, the proprietor has a right to expect concessions as to price from him, and from the architect who allowed the work to be improperly done. If the contractor worked to the drawings, he is in no way responsible; but the architect is, and the proprietor has a right to expect a concession in price from him. A. H.

DESIGN FOR CIRCULAR ROOF.

Birmingham.—E. M. writes: "I have a circular roof to construct, as shown in the sketch (not reproduced). Could you give me some particulars as to construction, and say what size timbers would be required? How are the required strengths worked out?"

The accompanying design is a suggestion to meet the case, but a right-angled roof with a cylindrical soffit, without tie rods at the springing, is not a very scientific arrangement, and the stresses are difficult to work out with any exactitude. The laminated circular rib should be built up in pieces bent to the curve, breaking joint and each screwed at fairly close intervals to its outer neighbour. A roof of this type will be found at page 60 of No. 2 "Specification," and in Plates XII., XV., and XVI. of Hurst's "Tredgold's Carpentry."

HENRY ADAMS.



DESIGN FOR A CIRCULAR ROOF. BY HENRY ADAMS.

SALARY OF LONDON BUILDER'S CLERK.

Bath.—Country writes: — "Would you kindly inform me what is the amount of salary per week of a London builder's general clerk of average capabilities? Also, what are the number of working hours per day?"

"Average capabilities" is too elastic a definition of the querist's qualifications to enable a reply to be very helpful to him. The pay of a builder's clerk in London is variable, ranging anywhere between £1 1s. to £3 3s. per week, the latter figure being reached only in the offices of large contracting firms, and then, usually, by reason of special capabilities in some special direction. As a general clerk in an office where but one (or at most two or three) is employed, from 30s. to 40s. per week would be about the rate, with working hours about ten per diem; and in return for the latter salary a clerk would be required to be tolerably expert at book-keeping, quick and capable at builders' arithmetic, neat and quick at tracing and able to turn out working drawings, accurate at taking off quantities and pricing bills and p.c. accounts, and able to measure up for and prepare estimates for repairs and alterations. In a large office, reasonable expertness in *one* branch would command as large a salary, with shorter hours (about eight per day) and a reasonable chance, if thoroughly expert, of attaining to and exceeding the higher figure mentioned. But it will probably be well within the mark to say that there are more London builders' clerks in receipt of a salary not exceeding 40s. per week than there are drawing a higher wage. H. E.

CONTRACTOR'S ALLOWANCE FOR CARRIAGE.

Blackpool.—W. S. K. writes:—"A contract for alterations in which terra-cotta is intended to be used is divided into two portions. The first only is carried out. No mention is made in the specifications of carriage, but they provisionally "allow the sum of £12 10s. for terra-cotta, add for profit and fixing" in the first part, and £10 10s. additional in the second portion. Materials being ordered for the whole scheme, the proprietor agrees to pay the extra ten guineas—or, rather, the exact cost, including carriage—but disputes liability for carriage on part of the work executed. Can the contractor claim for this? Terra-cotta was ordered by the architect and sent carriage forward to the builder, who has only been allowed the nett cost of it."

This question is very obscurely put; but, as well as I can understand it, the contractor is entitled to be allowed the cost of carriage of the terra-cotta, as well as the first cost to him, the two not to exceed £12 10s. A. H.

WHO KEEPS THE CONTRACT DRAWINGS?

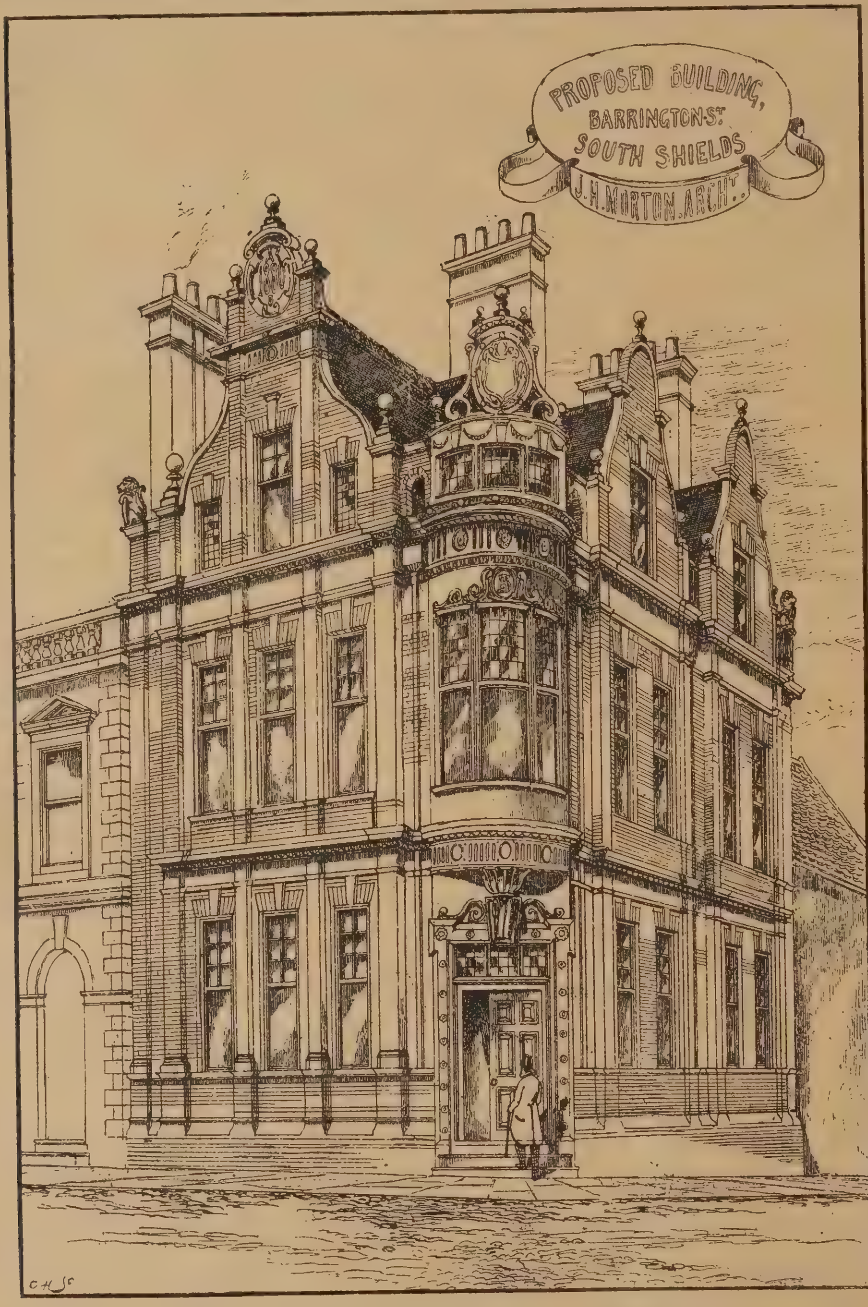
Bradford.—Specialist writes: "Can you advise as to any methods adopted by architects for securing possession of the contract drawings after works are completed? Our legal adviser informs us that the architect is not a party to the ordinary agreement between proprietor and contractor, and, consequently, any clause referring to the possession of the drawings is of no standing. He suggests a separate agreement in writing between the architect and the client, distinctly stating that the contract drawings shall remain the property of the architect at the completion of the works. This method of procedure does not recommend itself to us, being likely to cause friction."

The suggestion of your legal adviser is quite correct. There must be a distinct contract between the employer and the architect that the latter shall retain the drawings, as they are otherwise the property of the employer, who can demand their delivery as soon as he has paid the architect. A verbal contract would suffice; but a contract in writing would be the only safe one, as it would prevent any dispute afterwards. A. H.

Professional Practice.

Bristol.—Messrs. Wilkins and Son, the contractors for the Cheltenham Road Library, are making good progress with the building, which is expected to be ready by next October. The site is an excellent one, and the Corporation have secured sufficient land to give a good approach to the library. The design, by Mr. W. V. Gough, is in the Renaissance style of architecture and the building will be of Cattybrook brick with freestone dressings. The front elevation will be 65ft. wide and 38ft. to the parapet, while the building will extend back about 100ft. The front elevation will be divided into three bays and the entrance porch in the centre will be enriched with carved mouldings, surmounted by the city arms. The flanking bays will be provided with nine-light windows and the front will be finished with frieze, cornice, parapet and balustrades. An ornamental turret will rise from the centre of the roof. Separate entrances are provided for the public library and lending department, the latter being separated by a breast screen from the principal hall, which runs the whole length of the building. The North Bristol Library will probably be the best in the city and both in regard to situation and the increased facilities which the building will afford it will doubtless be much appreciated by those for whose benefit it has been designed. The total cost, including the purchase of the site and the leasehold interests involved, will be about £11,700.

Chorley.—A public library has, through the generosity of Mr. Herbert T. Parke, of Withnell Fold, been built in Avondale Road, from the designs of Messrs. Jolly and Buckley, of Dinsley. At the entrance there is a spacious vestibule and on going through the swing doors one enters the lending library apartment, well stocked with books. On the right of the lending library is the smoke room, a somewhat novel feature in a public library. Papers, &c., will be provided here. Next to the smoke room is the boys' reading room, a cosy apartment which will be supplied with boys' papers, &c., and in which the occupants can read books of fiction or other works which they have obtained from the lending library. To the left of the lending library is the reading room, one of the largest apartments in the building. Desks are provided for a number of newspapers and magazines, and other publications will be provided. In addition to the rooms mentioned, there is the reference library, which is reached by passing through the reading room. The librarian's office overlooks the lending library. The rooms are substantially furnished. The lending library will allow of shelving accommodation for about 16,000 volumes, and already there are between 5,000 and 6,000 books in this department. Towards the purchase of books and fittings the late Sir Henry Tate subscribed £500, and Mrs. Rylands has given £150. Mr. E. McKnight, formerly of the Wigan and Carlisle Public Libraries, is the librarian.



PROPOSED BUILDING,
BARRINGTON ST.
SOUTH SHIELDS
J. H. MORTON, ARCHT.

PROPOSED OFFICES IN BARRINGTON STREET, SOUTH SHIELDS.
J. H. MORTON, F.R.I.B.A., ARCHITECT.

London.—At the Greenwich County Court recently Mr. H. T. Bonner, architect, of Lewisham, claimed £62 and costs from Alfred Carter, tile merchant, of Brockley, for services rendered in the preparation of plans and specification for a building in 1897. Plaintiff deposed that he prepared, in accordance with instructions, plans and specification for the building. The amount of the lowest tender was £1,667 and his claim as recognised by professional usage was 4 per cent. on that amount. The increase in the cost originally mentioned by the defendant was due to defendant making alterations increasing the size of the cellarage and other extensions and additions to the original plan, the cost of which was not to exceed £1,100.—Evidence as to the recognised scale of professional fees having been given, defendant deposed that he engaged Mr. Bonner to draw up plans for a building which would cost about £1,000. Plaintiff said the work could not be done for that amount, but it would not exceed £1,100. Up to the time the tenders were received no one suggested that the work would cost more. When a plan estimated to cost £1,150 was submitted defendant suggested omissions which would reduce the amount to £1,100.—George F. Harrington, surveyor, said that he cubed the estimate at 8d. per cube; he considered that 2½ per cent. on the estimate would have been reasonable remuneration for plaintiff. Cross-examined:—Assuming his cubing was correct, the building as shown on the plans would cost £2,000.—Counsel for defence submitted that the plaintiff by exceeding his client's instructions had not complied with the terms of the bargain entered into at their first interview.—Counsel for plaintiff replied that when Mr. Bonner delivered the plans and estimate he had performed his portion of the work for which he had bargained.—His Honour gave judgment for the defendant with costs.

Manchester.—A new Board school—the thirty-second erected by the Manchester School Board—is being built in Moston Lane from the designs of Messrs. Royle and Bennett, architects, Cooper Street, Manchester. When completed it will accommodate 1,230 children (450 infants, 390 boys and 390 girls). The total probable cost, with the site, is estimated at £21,000. The site has an area of 8,700 square yards and there is ample accommodation for extension if this should become necessary in the future. The principal front of the school—which will be the longest Board school in Manchester—will face Moston Lane, and each department will have separate entrance and exit. The infants' department, which is to be on the ground floor, will comprise a hall 62ft. by 35ft. and eight classrooms, as well as a cloakroom and two good rooms for the principal and assistant teachers. Provision is also to be made upon this floor for an art schoolroom, manual instruction room, cookery room, laundry and storeroom. The boys' and girls' departments, on the upper floor, will each have a hall 50ft. by 35ft. (capable of being changed into one large hall, six classrooms, a cloakroom, and two teachers' rooms). The contractors for the work are Messrs. A. B. Bullivant and Sons.

South Shields.—The building in Barrington Street, South Shields, illustrated on this page, was designed for Mr. J. M. Moore, of South Shields, and consists of the necessary offices for the profession of a lawyer. The architect is Mr. J. H. Morton, F.R.I.B.A., South Shields.

New Companies.

Hareshaw Silica and Firebrick Co., Ltd.

This company has been registered in Scotland with a capital of £7,500 in 2,500 five per cent. cumulative preference and 5,000 ordinary shares, both of £1 each, to adopt an agreement with Thomas Gray, Alcathburn, Morningside, Newmains. Registered office: 83, West Regent Street, Glasgow.

W. Harris and Sons, Limited.

This company was registered on November 24th by A. Allistone, 25, Bedford-row, W.C., with a capital of £10,000 in £1 shares, to acquire the business carried on at 339—343, Edgware Road, W., by W. Harris, W. J. S. Harris and D. W. Harris as W. Harris and Sons, and to carry on the business of builders' merchants, &c. W. Harris (chairman), W. J. S. Harris and H. D. Harris are permanent directors. Qualification, 100 shares.

Maxwell, Lawrence and Co., Limited.

This company was registered on December 9th by Robert McGowen, 81, Dale Street, Liverpool, with a capital of £10,000 in £1 shares, to acquire any land and property, to erect buildings of any description, to construct and maintain roads, sewers, embankments, bridges, tramways and other works and conveniences, and to carry on the business of builders, contractors, decorators, stone and timber merchants, &c. The first directors (to number not less than five nor more than seven) are to be appointed by the subscribers. Qualification, £250. Remuneration as fixed by the company.

Sunderland Commercial Investment Company, Limited.

This company was registered on December 9th by G. W. Bain, 46, John Street, Sunderland, with a capital of £10,000 in £1 shares, to acquire any lands, buildings and other property in Great Britain, to lend and advance money to builders and others, to grant loans upon mortgage or other security, and to carry on the business of builders, contractors, miners, &c. The first directors (to number not less than three nor more than five) are W. Burns, G. Porteous, J. G. Kirtley and G. W. Bain. Qualification, £200. Registered office: 46, John Street, Sunderland.

Westralian Jarrah Forests, Limited.

This company was registered on November 30th by H. E. Warner, 10, Finsbury Circus, E.C., with a capital of £120,000 in £1 shares, to adopt and carry into effect an agreement to be made between a company bearing a similar title (registered July 6th, 1898), in liquidation, and T. Wigham, the liquidator thereof, of the first part and this company of the other part, for the acquisition of the business, undertaking, assets and liabilities thereof; to acquire certain timber estates in Australia, and to develop, deal with, work and turn to account the same in such manner as the company shall see fit; as timber growers and merchants, sawmill proprietors, and to carry on the business of miners, &c.; to develop the resources of land by planting, &c.; to construct and maintain gasworks, rail and tram roads, &c.; to equip and dispatch expeditions; as brick and tile makers, builders and contractors, dealers in precious stones, &c.; to acquire and turn to account any real or personal property; to acquire and turn to account any patents, patent rights, &c.; to carry on in all or any of their respective branches the businesses of shipowners, shipwrights, proprietors of graving or other docks, wharves, warehouses, &c., &c. The first directors (of whom there shall be not less than three nor more than seven) are Hon. H. Finch Hatton, G. P. Neele, M. J. Burlinson, W. Goff and R. Brown. Qualification, £250. Remuneration, £200 per annum each; chairman, £300, with a percentage of the profits, divisible. Registered office: 34 and 36, Gresham Street, E.C.

New Patents.

These patents are open to opposition until January 29th.

1898.—Acetylene Gas Generators.—24,501. W. Ellen, Manchester. The generators consist of cylinders provided with removable holders for the carbide. These holders have divisions. The generators are fixed obliquely to the side of the gas tank, and water is let into them near the bottom. The cock on the gas-supply pipe is connected with the cover of the generator by a link and handle, and the action of opening the cover shuts the cock—and *vice versâ*.

Fireproof Paints.—25,275. A. J. Boult, London (*P. Carré, Paris*). When the composition is used for impregnating such materials as curtains, canvases, papers, &c., it consists of water, 100 parts; boracic acid, 4 to 8 parts; sulphate, hydrochlorate or carbonate of ammonia, 15 to 50 parts (according to the nature of the material); and borax, 1 to 5 parts. This mixture is preferably used at a temperature of between 70deg. and 80deg. C. When it is used to colour as well as to fireproof it is used with a mixture of water 100 parts and hide glue 50 parts. When used as a paint, it is mixed with white lead or zinc white, and thinned with turps.

Locks.—25,730. P. Kossov, W. Wisehew, and P. Sofronow; all of St. Petersburg. The key consists of a flat steel blade perforated with holes diversely arranged and of different sizes. These engage with pins on cylinders and so enable the lock to be opened.

Packing Tiles and Bricks—25,943. J. Webb, Leeds. To prevent the glaze on bricks, tiles and similar goods becoming damaged during transit, paper is attached to the back surface with cement, passed over the face, and damped; it then stretches taut.

Smoke Consumers.—27,156. G. C. Leslie, London, S.E. Fixed in the chimney is a grid covered with loose asbestos. Underneath it are some gas burners, and around it may be a water jacket or boiler. The gas makes the asbestos incandescent, and by these means the unconsumed smoke that escapes from the fire is consumed, generating enough heat to raise steam in the boiler and so compensate for the cost of the maintenance of the apparatus.

Hot-water Regulators. — 27,228. W. Geipel and F. M. T. Lange, both of London, S.W. This invention is to enable an approximately constant temperature to be kept up in hot-water heating apparatus. At the top of the boiler a brass tube and an iron tube are provided, both being fixed at one end and being free to move at the other in order to impart motion to a cord connected with a controlling damper. The tubes form two sides of an isosceles triangle. The idea therefore is chiefly based on the different coefficients of expansion of the brass and iron.

1899.—Fireproofing Compositions.—345. H. Y. Simpson and the British Non-Flammable Wood Company, Ltd., both of London. Mixed with about 30oz. of zinc paint are, silicate powder, 2oz.; borax, 2oz.; phosphate of ammonia, 1oz.; and chloride of sodium, 1oz. Hydrate of aluminium may be substituted for the borax. Lead paint is recommended in preference to zinc paint, as it is more fire-resisting.

Oil-stone Boxes.—1,496. J. Whitehouse and J. G. Billings; both of Evesham. The box is made of tin and is turned up on the bottom to support the stone clear; it is also sufficiently wide to leave a space at each side of the stone. At one end abutments are provided and at the other a thumb-screw, by which the stone is held in place. The oil that is rubbed off does not get on to the table or bench, but falls into the bottom of the box, whence it can be easily removed.

Windows.—1,830. W. Fischer, Dortmund, Germany. The two lower sashes are arranged to slide into recesses in the wall on each side, and when this is done the upper light can be lowered down.

Electric Light Pendants.—1,941. H. Hirst and J. Murphy; both of London. From the ceiling rose extends a pivoted arm on which is mounted a pulley over which the flexible conductor passes, being counterbalanced in the usual way. By these means a radial as well as a vertical movement of the lamp is possible, increasing the area of illumination.

Air Pumps for Testing Purposes.—19,659. R. W. Boyd, London, W. At the back of the cylinder is an opening through which air is sucked in by the forward movement of the piston. At the other end are discharge valves. At the back also is fixed a box containing peppermint, &c., which disinfects the incoming air.

The following specifications were published on Saturday last, and are open to opposition until February 6th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.— 24,788, McDonald, lavatories. 24,789, McDonald, two-piece closets. 25,155, James, manufacture of artificial marble, granite, and the like. 25,203, J. Duckett and Son, Ltd., and Duckett, top-flushed slopwater closets. 25,297, Bucher, apparatus for generating acetylene gas. 25,335, Scotland, means for heating dwellings, halls, and the like. 25,548, Ruble, Adams and Iorns, apparatus for withdrawing shavings, dust and the like, and for ventilation. 26,488, Wilson, manufacture of incandescent gas burners.

1899.—666, MacKenzie, street lamps. 1,664, Boisselier and Laurent, manufacture of bricks, slabs, blocks, flagstones, and the like. 1,756, Davies and Earle, drying apparatus applicable for use in the manufacture of Portland cement and for analogous purposes. 1,828, Wilkes, Wilkes and Goodman, manufacture of the cases or bodies of locks and other like cases. 1,982, Wethered, locks and latches. 1,984, Garland, adjustable canopies of stove grates. 2,011, Nesbit and Ashwell and Nesbit, Limited, drying horses and similar apparatus. 2,013, Mathewson, sand blast apparatus. 2,128, Robinson, machines for making bricks, tiles, and the like. 2,392, Schneeweis, acetylene generators. 4,223, Berger, apparatus for generating acetylene gas. 16,266, Göttsch and Fehrs, hanging stages or scaffoldings. 16,275, Adshead, centre portion of metallic curbs and fenders. 17,339, Imray (*Soc. des Verreries de Bruxelles*), process for the total or partial hardening of glass. 17,343, Dauber, apparatus for making acetylene gas. 19,973, Whitehead, Harris and Sacre, cowls for the prevention of downdraughts, rain, and the like, in chimneys and ventilators. 20,518, Weill, process for the production of artificial marble. 20,883, von der Höh, door and other locks. 21,017, Thompson (*Piepmeyer and Karst*), apparatus for heating buildings and the like. 21,641, Rodda, device or contrivance for use in connection with drawing pencils and the like. 21,683, Boult (*Novotny and Mierisch*), apparatus for scouring and cleaning pipes and conduits. 21,699, Schmitz, process for manufacturing pipes. 21,746, Greger, manhole frames and covers.

COMING EVENTS.

Friday, December 29.

London Institution.—Mr. Alfred H. Fison, D.Sc., F.R.A.S., on "Light and Colour." 4 p.m.

Monday, January 1.

London Institution.—Mr. Alfred H. Fison, D.Sc., F.R.A.S., on "Colour Mixture and Colour Sensations." 4 p.m.

Thursday, January 4.

London Institution.—Mr. Alfred H. Fison, D.Sc., F.R.A.S., on "Photographs in Natural Colours." 4 p.m.

Provident Institution of Builders' Foremen and Clerks of Works.—Ordinary Meeting of members at 8 p.m.

Civil and Mechanical Engineers Society.—Mr. W. A. Francken, A.M.I.C.E., on "Well Foundations in India." 8 p.m.

Royal College of Art, South Kensington.—Mr. Arthur Thomson, M.A., M.B., on "The Anatomy of the Human Form: XII.—The Upper Limb."

SEWAGE PURIFICATION WITHOUT FILTRATION.

By W. KAYE PARRY, M.A., A.M.I.C.E.

NINE years ago Dr. Adeney claimed that sewage could be purified by developing the micro-organisms contained in the liquid itself, and he asserted that this could be accomplished by the addition of small quantities of oxygen carrying chemicals to the sewage. Prior to that time no chemist had put forward such a method as practicable. It is true that Dr. Dupré had suggested that the solution of the sewage problem might be found by the preparation of a special culture to be added to the sewage, but the utilization and development of the organisms in the liquid itself as the direct agents of purification was an absolute novelty. Others had, indeed, shown that the beneficial effect of land treatment was due to biological action, but that this same result could be obtained in the body of the liquid without land and without filters of any kind was a new departure. In these days we have become familiar with the action of bacteria, and everyone knows that given suitable conditions they are the best, nay, the only agencies upon which we can rely for the reduction and oxidation of organic matter. Nine years ago, men spoke learnedly about "occluded oxygen" as the active agent in certain filtering materials, and the direct oxidising action of atmospheric oxygen was looked upon as the active principle in the breaking down of the organic matter.

From the very outset of his work, Dr. Adeney expressed the opinion that the results were accomplished not by the direct action of atmospheric oxygen, but by the organisms whose activity was promoted by a sufficient supply of oxygen, and he stated that it would be more economical to supply them with oxygen by means of a suitable chemical compound than to endeavour to utilise atmospheric oxygen itself. He was also led to believe as a matter of economy that it would be cheaper to separate the insoluble organic matter in the first instance by means of some suitable precipitant, so as to reduce the work of the organisms and to enable them to concentrate their energies on the organic matter in solution. Further researches supplied him with a precipatating material which was in itself an oxygen carrier, so that when it was mixed with the body of the sludge it supplied oxygen to the organisms, who performed the work of destruction in the precipitated solids. The organisms thus fully provided with the necessary stimulus to their life processes effect the reduction and oxidation without setting up putrefaction or causing the evolution of noxious gases.

Thus, while the organic matter in the liquid is rendered harmless and inodorous, the solids are subjected to the same action. Sludge is formed, no doubt, but sludge which is absolutely unlike any other sewage sludge, and which presents no difficulties as regards disposal. It need not be pressed because it is always sweet, and it can be exposed and dried without the faintest trace of smell. It dries rapidly down to a small percentage of moisture, and can be handled and carted like garden mould, which it closely resembles; it has also proved to be a really useful manure. Briefly, then, the result of nine years' work is to show that liquids containing organic matter in solution can be purified without filters and without land, and that wet sludge containing organic matter can be handled, dried, and utilised without danger, without offence, and without machinery. These statements are being verified day by day, wherever Dr. Adeney's principles have been intelligently applied.

Meanwhile, many other alternative methods for utilising the beneficent action of micro-organisms have received considerable attention. Mr. Dibdin proposes to dispense with all preliminary tanks and chemicals and to subject the crude sewage itself to the direct action of the bacteria, through the instrumentality of artificial filters, relying solely on the aërobic organisms to effect the result. Mr. Cameron claims that it is more advantageous to pass the sewage in the first instance through a closed tank, in which he contends that the anaërobic organisms effect the necessary preliminary changes which render the liquid more amenable to the filtration, which is the final stage of his process. In both cases, however, it is claimed that no chemicals are used and no sludge is formed.

For the purpose of this paper it is not necessary to discuss the arguments or the evidence by which either of these claims is supported. Let us for the moment assume sewage may be treated successfully in either of the three ways which have been mentioned. The controversy will then resolve itself into a mere question of relative cost. At the meeting of the Sanitary Institute at Birmingham, the writer pointed out that additional evidence was still needed to show which was the most economical method. Artificial filters and large tanks involve considerable capital expenditure, and the life of a filter has still to be ascertained.

From the calculations which the writer has made, based upon the most recent estimates of the cost of bacterial filters, he has come to the conclusion that a process which includes the use of chemicals and the production of sludge may compare favourably with a really efficient purification plant which involves the construction and maintenance of artificial filters. But before passing away from the sludge controversy it is well to bear in mind that in every million gallons of average town sewage there is one ton of mineral matter in suspension, which the living organisms in the liquid are powerless either to liquify or to annihilate. If this mineral matter be intercepted in suitable tanks or catch pits, it will represent ten tons of wet sludge containing ninety per cent. of moisture for every million gallons treated.

In the face of this fact, how can it be seriously asserted that by the use of biological filters there will be no sludge. It is not possible to separate the mineral matter in suspension from the heavier part of the organic matter, some of which must remain in the catch pits or tanks designed to intercept the mineral matter and road detritus. The presence of organic substances will not only give rise to putrefaction, but will add to the bulk of the wet sludge to be handled and disposed of. If on the other hand the crude sewage be allowed to flow on to the filters without sedimentation, the mineral matter will be left in the filters, and as it is finely divided it will fill up the voids, and eventually choke up the filters.

One other consideration is worthy of attention. At Sutton not only is there a catch pit to intercept the heavier road detritus, but there is a very perfect and most efficient mechanical screening machine, which separates a large percentage of the fæcal matter, and almost all the paper. The sewage comes down to the works very fresh, so much so, that neither the fæces nor the paper have had time to dissolve and a large part of the organic matter never finds its way to the filters at all.

The writer himself is satisfied that in every system of sewage treatment there must be some residuum, which if it be not removed will sooner or later clog any filters; whereas if it be removed it constitutes sludge which must be handled and disposed of, and the great charm of the bacterial filter and of the septic tank disappears. It would appear to be preferable to face the cost and inconvenience of some preliminary treatment for the purpose of separating the solids day by day, rather than to run the risk of filling up the voids in the filters, as the periodical renewal of the filtering material will entail a serious charge on the rates. Should experience prove that after all some preliminary treatment is an alsolute necessity in dealing with town sewage and that filtration can only be successfully adopted after some such treatment, then it can easily be shown that the annual charge consequent upon the construction of artificial filters will represent a very much heavier burden than the application of Dr. Adeney's principles for dealing with the solids in solution. From his own observations the author is convinced that notwithstanding the Barking experiments it will be found in practice that for the purpose of obtaining a good effluent by filtration of a previously clarified sewage, it is necessary to provide two acres of artificial filters for every million gallons of liquid treated per day.

The cost of artificial filters under the most favourable circumstances will never be less than £2,000 per acre and will often greatly exceed this amount; but even at this rate the interest and sinking fund will amount to £200 per annum per million gallons. This is equal in round figures to a rate of 11s. per million gallons filtered, without allowing anything at all for labour or for purchase of land. From these figures it would seem that we are not likely to materially reduce the cost of sewage treatment by the adoption of biological filters.

In support of this last proposition, the writer will conclude by citing Mr. Baldwin Latham's figures as to the probable cost of artificial filters for Manchester, which he estimates at £300,000. Taking interest and sinking fund together at 5 per cent., this outlay would represent a charge of £15,000 a year for the construction alone (or £1 11s. 7d. per million gallons filtered), without allowing anything for land purchase, working expenses and renewals; whereas the cost of purchasing and applying a suitable oxygen carrying compound to the clarified sewage of Manchester, which s calculated at 26,000,000 gallons a day, would not amount to more than one third of this sum.

PUBLIC SLAUGHTER-HOUSES FOR RURAL DISTRICTS.

By R. SYDNEY MARSDEN, M.B., D.Sc., F.R.S

I TAKE it that the desirability of substituting public slaughter-houses in place of private ones in our urban districts is now universally admitted by all who are in any way conversant with the subject and I therefore do not require to go into the pros and cons of this part of the subject; but with regard to their provision in rural districts, there may be differences of opinion. Personally, I consider that public slaughter-houses in rural districts ought to be provided. You can never get proper control or efficient inspection of your meat supply without them. What is the existing state of things? In the great majority of country districts the inspector of meat is the general inspector of nuisances, whose time is fully taken up with the ordinary sanitary work, and as a general rule he knows absolutely nothing about the diseases of meat.

The Medical Officer of Health is very often a half-timer, whose knowledge of meat really consists of his pathological training as a medical man, and who generally has not any special knowledge in meat inspection. He is only called in when the inspector drops upon a flagrant case or has made a mistake, and does not know quite where he stands; the outcome very often is loss of prestige to the reputation of both, and the result is that there is not very zealous attention paid to this particular portion of the official duties and in large portions of the country there is practically no inspection whatever. The result of this is that the little slaughter-houses dotted about all over the country in different villages, are in many cases excellent centres for bad and affected meat (after being tampered with, stripped, and dealt with in every possible way so as to hide the disease) to be sent into the markets and into the towns (if it can be got in) by every way and bye-way, and the final result of it is that, in spite of the strictest inspection in the town abattoirs, a great many towns are suffering from this poisoned traffic coming in from the country, where there is no inspection whatever.

I do not see how, if you do not grapple with that particular branch of the question, any amount of true inspection in the towns is to give you more than a limited protection, and I think the matter is one which calls for immediate attention. I have long thought that if district centres were formed (on much the same lines as combined districts for fever hospital purposes) where the slaughtering must take place, and a properly qualified man is district meat inspector to supervise that particular section, practically the immunity which a town now possesses would be obtained. I would make central abattoirs in the centre of the various districts, and abolish private slaughter-houses entirely throughout the country.

But, it will be said, would not this imply either an immense number of these abattoirs in country districts or the sending of the meat very long distances? I do not think so. Nearly all country districts are arranged around some particular centre which is the focus of the whole place. Take postal districts, for instance, they all centre in the most convenient village of the districts they serve; and it is there that I would put the public abattoir for the district. Of course this would necessitate the butchers coming from the adjacent villages to kill and fetch back their meat, which in some instances, would mean travelling two, three or even as much as five or six miles, but the same distance would have to be travelled in many of our large towns, such as Liverpool, Manchester and Birmingham from the outlying districts to the public abattoirs, especially if the abattoirs were placed at one end of the borough. Distance, however, does not count for much in the country once a man has started in his cart, if he could carry the meat two or three miles, he could without much more difficulty carry it five or even six. What I mean is that in country districts you do not think much of a mile or two, more or less, nor of anything within reasonable distance.

Every man who has been a country medical practitioner knows this quite well; he knows that there is a certain radius around his particular centre which can be conveniently served and worked, and that the distance of a mile, more or less, is not accounted very much of a difficulty when once he has got started. The country doctor knows pretty well which is the most convenient centre for working a district, and you will generally find that it corresponds fairly closely with the postal centre. I see no great difficulty therefore in making such a centre the one for a public slaughter house.

But I shall be told that would imply an enormous number of abattoirs throughout the country? Yes, but there are an enormous number of private slaughter-houses throughout the country, which are all to my mind centres which cannot be, and are not, inspected, and which, generally, are not conducted on very sanitary grounds in any way.

A great deal of questionable and diseased meat is killed in some of these places, and is sent into the market and into the towns, and in this way frustrates, to a large extent, the objects of meat inspection in the urban districts. You cannot get proper inspection of meat until you have got rural as well as urban public abattoirs under the supervision of specially qualified meat inspectors, well acquainted with the trade. Such inspectors ought, in my opinion, to be appointed by the County Councils, and work under the direction of the County Medical Officers of Health. This would relieve them and the District Medical Officers of Health from the local influences which must necessarily bear upon them, if such officers were held under district councils; and it is most desirable that officials having to perform unpleasant duties of this kind should be removed as far as possible from such local influences. I am therefore strongly of the opinion that rural public abattoirs are practicable and desirable, and that it is only by the institution of such places in both urban and rural districts that any really efficient inspection of the meat supply of the country can be obtained.

The two foregoing papers were read before the Annual Congress of the Sanitary Institute, held at Southampton, on August 29th, 30th, and 31st last.

Wood-paving in Charterhouse Street, which connects Holborn Circus with the Smithfield Market, has just replaced the granite setts it was formerly paved with.

CHICAGO DRAINAGE CANAL.

A WORK THAT WILL COST £6,000,000.

THE New Year will see the opening of one of the greatest, if not the greatest, piece of sanitary engineering ever executed—the Chicago drainage canal. The work is an important one, because it provides for the sewerage of a city—or, to speak more accurately, of a sanitary district—with a population of one million and a half, but its chief interest lies in the fact that it boldly achieves this object by tapping Lake Michigan and pouring part of the waters of the great lakes down into the Mississippi.

The site of Chicago, says a correspondent of the Aberdeen "Daily Free Press," would have been a bad one for a village, to say nothing of a town, for it was originally a marsh on the shores of Lake Michigan. The tall buildings of Chicago are founded on networks of piles driven into the treacherous soil, and it was not so long ago that the notice "No bottom here" was frequently seen on the tracks which are now busy thoroughfares. Through this dead level the Chicago river finds its way to the lake. It would be inaccurate to say it is little better than a sewer. It is worse, because it is uncovered. The sewage of Chicago is discharged into it at all points and, as the current of the stream at ordinary seasons is not strong enough to scour it out properly, the waters simply stagnate and breed fever right in the heart of the city. A good flow, however, would make the plight of Chicago worse than ever. As it is, the river is carrying the sewage far enough out into the lake to pollute the famous tunnels from which the city's water supply is drawn. The pass to which things have come may be gathered from the bulletin which the municipal authorities issue every day, advising the public of the purity or impurity of the water pumped through the different cribs. It was to purify the Chicago river and to protect the city's water supply from pollution, that the drainage canal was undertaken.

What Chicago has done has been to cut a trench, 22ft. deep, so as to make its river flow into the Des Plaines river instead of into Lake Michigan.

The new canal extends from a point on the Chicago river six miles from its mouth, but only two miles as the crow flies from the lake, to Lockport, where it discharges into the Des Plaines river. The distance is slightly over twenty-eight miles. But why, it may be asked, make a cut of twenty-eight miles when the watershed is only eight miles away? The explanation is easy. Had the junction been made between the Chicago river and the Des Plaines river at their point of nearest approach, the latter would have been as likely to flow east as the former to flow west. The condition imposed by the State Legislature when it sanctioned the scheme was that there should be a flow down the canal of 300,000 cubic feet per minute. This was, of course, to secure the proper dilution of the sewage, and it was provided that the flow should be increased by 20,000 cubic feet for every 100,000 added to the population of the district. To insure this flow by gravitation it was necessary to cut the trench not merely across the watershed but to a point some twenty miles down the other side, there being a fall of only 6ft. in the total distance of twenty-eight miles. This, however, owing to the level character of the ground, was not such a serious task as might be expected. As a matter of fact, the deepest cutting on the whole canal is only 50ft., or 28ft. to the surface of the water. The first thirteen miles of the channel are through glacial drift. The lower fifteen miles are through solid limestone rock, and so neatly has the excavation been done that one would imagine it to be the work of some gigantic grooving machine.

As may be supposed, the contractors for the work displayed all the usual American ingenuity in devising labour-saving appliances, but no machines did better service than the rock-drillers. A short piece of track was laid down in the line in which it was proposed to cut the canal. On this a steam driller moved backwards and forwards, gradually cutting out a groove about 7ft. deep. A similar machine was at work on the other side of the canal and at the same time ordinary tripod drillers bored a row of shot holes between the grooves. When the blast was fired, the whole section was dislodged without shattering the adjacent rock. The operation was repeated with two lower decks of rock, as they might be called, and the canal, 22ft. deep, was left with sides as clear cut as quay walls. During a single month, the contractor for one of the sections excavated 86,000 cubic yards of solid rock, an achievement which is claimed to be without precedent. The width of the channel at the bottom varies from 110ft. in earth to 160ft. in rock, the dimensions of the rock portion of the cutting being sufficient for a population of three millions. The flow in the earth part of the channel will, as occasion requires, be increased by dredging. It is calculated that the earth and rock excavated during the work would, if deposited in the lake in 40ft. of water, make an island one mile square, with its surface 12ft. above the water-line.

At Lockport, where the canal opens into the Des Plaines river, an immense controlling dam has been built. The level of Lake Michigan varies according to the direction in which the wind is blowing. These fluctuations will be felt at the controlling works, and the dam, with its sluice gates, has been built to a height several feet above the lake level, so as to absolutely control any abnormal flow of water from that direction. Through the sluices the waters of the canal will pass into the Des Plaines and in order that the sewage-laden stream may be properly "aerated" and exposed to the bacteriological action of the sunlight, a wide extent of haugh or "interval land," as it is called in Chicago, has been purchased just below the dam. The water will spread itself over this flat area and then without any further effort being made at purification, will continue its course down to the Mississippi. Actual work on the channel was commenced in the autumn of 1892. The total cost will be 33½ million dollars, or, roughly speaking, over six million pounds sterling. The Suez Canal, 66 miles long, took nine years to construct, and cost twenty millions sterling; the Manchester Canal, 35 miles long, took six years, and cost fifteen millions; and the North Sea Canal, 61 miles long, took eight years, and cost seven millions.

The opposition to the scheme has been keen and determined. Towns lower down the Mississippi—such, for instance, as St. Louis, which draws its drinking water from that source—naturally object to their river being made a receptacle for Chicago's sewage, and, though it is now too late to kill the canal, considerable obstacles, based on technical grounds, might be put in the way of its completion. Were the water once in the canal the promoters would feel safe, because possession is nine points of the law and because they believe that actual demonstration will confute the critics. That is why the Sanitary Board is straining every nerve to finish the work and why it hopes to get the channel into operation by January. Officially, the channel has been always described as a ship and drainage canal. Chicago is ambitious and there are doubtlessthose who honestly regard the work about to be opened as the first instalment of a great undertaking which is one day to make their city the commercial metropolis of America. In their dreams they see the argosies of the Western Continent floating to their gates from the south as from the east, but for the present at any rate they will be content if the canal serves the prosaic purpose of draining Chicago.

Swansea Electric Lighting.—The electric lighting committee of the Swansea Corporation have decided to recommend the acceptance of the tender of Messrs. Gates and Tom for boilers, steam piping, &c., at £10,800. It has also been decided to oppose the Bill of the South Wales Electrical Power Distribution Company, some particulars of which were given on page cxxxiii. of the supplement to the BUILDERS' JOURNAL for November 29th last.

COMBINED REFUSE DESTRUCTORS AND POWER PLANTS.

A PAPER with this title was read by Mr. C. Newton Russell, Assoc.M.Inst.C.E., at a meeting of the Institution of Civil Engineers on December 12th, dealing with the subject of refuse destruction, particularly in reference to its employment for raising steam. The results obtained from eight combined plants in England and two abroad were given, the data of which all tended to prove that a considerable amount of energy in the form of heat was to be obtained from the burning of ordinary domestic refuse. The Shoreditch plant was dealt with in considerable detail, as being the largest of its kind in operation.

The total amount of refuse destroyed at Shoreditch during a period of twelve months was about 26,000 tons, of which 92 per cent. was ordinary domestic refuse and 8 per cent. trade refuse, consisting of straw, paper, &c. The latter was practically useless for steam raising. The plant consisted of six Babcock-Willcox water-tube boilers and twelve refuse-furnaces of the Manlove-Alliot type, each boiler being placed between two refuse-furnaces, the hot gases from which were led into the boiler-tubes through short side-flues, each boiler being provided with a special grate, on which coal might be burned if required. The average amount of refuse received per day was eighty-four tons, delivered between 9 a.m. and 5 p.m., although as much as 140 tons had been received in one day. It appeared to be impossible in ordinary working to guarantee a regular supply, and it was advisable to provide means of storage to cope with extra large deliveries. This difficulty was met by means of a large rectangular iron storage-bin fixed under the tipping platform and holding about sixty tons of refuse. Forced-air draught was supplied to the fires by electrically-driven fans, the pressure in the ashpits being 1in. of water. No coal or other fuel was mixed with the refuse, which burnt freely; the maximum temperature observed being 2,500deg. Fahr., and the average, 1,500deg. Fahr. The clinker residue amounted to 32 per cent. The works were managed on the eight-hour shift system, seven days per week.

The steam generated in the boilers, at an average pressure of 140lb. per square inch, was consumed mainly by the engines attached to the electric generators, although a small portion of live steam was supplied for clothes-washing purposes to the public baths and washhouses adjoining the electricity works; exhaust steam was also supplied to the baths and free library, which were entirely heated from the steam raised by the refuse-destructor.

The average cost of burning the refuse during the second year of working, including four furnace men, two top men and one charge man, supervision clerks, &c., cleaners and yard men, repairs, stores and sundries, was 2s. 6·9d. per ton. The amount of electric energy absorbed in dealing with the refuse, including electric fans, lifts, trucks and lighting, was 4·98 Board of Trade units per ton per annum. A number of evaporative tests had been taken with the result that with one boiler and two refuse-furnaces it was possible, by the burning of ordinary refuse, to evaporate 2,888lb. of water per hour, from and at 212deg. Fahr.

The average calorific value of various tests was 0·99lb. of water per lb. of refuse. The heating surface of each boiler was 1,300 square feet, the refuse grate area was 25 square feet, and the coal grate area was 27 square feet. The total amount of energy sold by meter to consumers was 1,031,348 Board of Trade units, including 131,140 units supplied to the refuse destructor. The total amount of refuse burnt was 26,201 tons and of coal consumed 1,344 tons (value £1,308 14s. 8d.). The item of cost per ton for interest and redemption of land and plant—not usually considered in connection with refuse destructors—was a matter for serious consideration, and in the case of the Shoreditch destructor plant—where land is very expensive—the charge worked out at practically 1s. per ton.

Builders' Notes.

Housing of the Working Classes.—At last week's meeting of the London County Council the following amended recommendation of the Housing of the Working Classes Committee was agreed to:—"(a) That it is desirable that an amendment of the Housing of the Working Classes Act, 1890, should be obtained, so as to empower the Council to acquire land outside the County of London for the erection of working class dwellings. (b) That the Housing of the Working Classes Committee be authorised to appoint a deputation to wait upon the Secretary of State for the purpose of urging him to introduce a Bill in the next Session of Parliament for the amendment of the Housing of the Working Classes Act, 1890, so as to empower the Council to acquire land outside the County of London, for the erection of working class dwellings, and that it be referred to the Committee to consider and report whether the special provisions of the Act as to the compensation payable in respect of property taken within unhealthy areas can be equitably amended, so as to reduce the heavy cost of clearance schemes to the ratepayers, and to compel the owners of insanitary property to bear the whole cost of re-housing the persons displaced on such areas."

A Plymouth Party Wall.—The case of Bishop v. Sweet came before the last sitting of the Plymouth County Court. Plaintiff is the owner of No. 6, Chapel Street, and defendant of premises adjoining. The wall separating the premises was a party wall. In January, 1899, a portion of the wall was in a condition necessitating repair and the plaintiff repaired the wall at a cost of £4 17s. 2d. Defendant refused to contribute to the cost of the repairs and the plaintiff claimed half the cost, £2 8s. 7d. His Honour, Judge Woodfall, said the law seemed somewhat involved, but, as far as he could arrive at a conclusion, a tenant in common was under no obligation to contribute to the repairs to common property unless an obligation arose with reference to a third person. If this wall were a source of danger to third persons, the owners of it would be under a liability to keep it in such a state that it should not be a danger. That was not so in this case and he could find no other obligation which would compel the defendant, if she willed otherwise, to contribute to the repair of common property. Tenants in common, if they could not agree as to what was to be done, had a remedy in equity; but it seemed to him there was no obligation, expressed or implied, in this case, and there must therefore be judgment for defendant.

The New London Government Act.—The Hon. Everard Fielding, an Assistant Commissioner under this Act, opened a public inquiry last week at the Hackney Town Hall for the purpose of altering and adjusting such areas and boundaries of the new borough of Hackney as might be found expedient. Mr. B. Browne, Q.C., said the agreement come to with Bow and Shoreditch had been to the gain of the latter and the loss of Hackney. In dealing with Islington he felt Hackney was entitled to compensation, as Islington had gained through the agreement with Shoreditch. The proposal Hackney put was to resign rateable value on the eastern side of the proposed boundary, amounting to £6,806, and to take property on the northern side from Islington of the rateable value of £8,329. This left a balance of £1,520 to the gain of Hackney, which was only just, considering the sacrifice made to Shoreditch, by which Islington derived benefit. Evidence was given and the Assistant Commissioner said he would make his report.—Some interesting points were introduced into the inquiry held by Mr. C. Dill at the Clerkenwell Town Hall relative to East and Central Finsbury. With regard to the parish of Glasshouse Yard, Mr. R. Griffiths submitted that it was in the City boundaries, because it was under the jurisdiction of the City Sewers. But Mr. Gomm, statistical officer of the London County Council, said that Glasshouse Yard was in the Parliamentary borough of Finsbury and the fact of its being drained by the City Sewers was only what might be termed a domestic arrangement of convenience; it in no way transferred it to the City.—At the Hampstead Vestry, Mr. J. W. Thompson held an inquiry as to the future boundaries of Hampstead. The Marylebone Vestry propounded a scheme by which Hampstead would give up St. John's Wood Park and part of Avenue Road in exchange for property adjoining Primrose Hill, which would bring the Hampstead boundary down to Regent's Park. Mr. Stringer, for Marylebone, contended that this latter property ought to belong to Hampstead, as it was practically detached from Marylebone and it would give a simpler boundary. Mr. A. P. Johnson, for Hampstead, objected on the ground that the proposed alteration would affect too many householders. Mr. Thompson announced that he would report on the matter to the Commissioners.—It will be seen from the foregoing that the settling of the boundaries of the various districts will entail much trouble and difficulty.

A Large Housing Scheme.—The Housing of the Working Classes Committee of the London County Council intend, shortly after the Christmas recess, to ask the sanction of the Council to a large scheme for housing the poor in the neighbourhood of Tooting. The site of the proposed new buildings is known as the Totterdown Fields site and consists of about 38½ acres. The purchase price is agreed at the rate of £1,150 an acre, so that the total amount will be about £44,500. The site is close to the terminus of the Council's tramways and the other means of access are stated to be good. The cottages which it is proposed to erect on the site will be constructed so as to provide for two families each. They will each consist of two self-contained tenements, one of two and one of three rooms. Separate gardens will be provided for each tenement, and, on an average, not less than thirty cottages will be built to the acre. The rent of the tenements should average about 7s. 6d. per week. It is not anticipated that any charge on the rates will be involved by the erection of the cottages. As the Council is at present obliged to repay the cost of the land and buildings in sixty years, it is upon this basis that all the calculations will be made. The committee are unable at present to state precisely the cost per cottage, but it is probable that the total cost of land, roads and buildings will be about £500,000.

London County Council Works Department.—The Finance Committee of the London County Council has just issued the half-yearly return of works executed by the works department. The returns relate to estimated and jobbing works completed during the half-year ended September 30th. During that period fourteen estimated works were completed and certified. The cost of these works has been £23,376. Only three of them show an unfavourable result and in only one case, that of the erection of Wargrave Buildings on the Boundary Street area, can the excess cost be regarded as serious. In eleven cases the works have been executed at a total saving on the estimates of £1,713. The net result, however, owing mainly to the excess on Wargrave Buildings, is that the saving on final estimates for the half-year is only £587. At the end of the return is a statement showing the totals of the actual cost and of the final estimates of all works executed by the department since its creation in November 1892. From this it appears that works estimated to cost £838,642 have actually cost £883,232, thus showing a loss of £44,590. The loss shown during the existence of the Works Committee and previous to the reorganisation of the department as the result of the special inquiry was £54,954, but since then there has been a saving of £10,364. On the jobbing works which have been carried out since 1895, when the schedule of prices came into operation, there has been a total balance of cost below schedule value, or a saving of £8,624.

Compensation Case at Doncaster.—At the Doncaster County Court, before Judge Masterman, an application was recently made on behalf of Patrick Corley, labourer, for an arbitration under the Workmen's Compensation Act, 1897. The respondents were Messrs. Walter Scott and Co., of Goldthorpe, near Rotherham, contractors. The grounds of the application were that on September 22nd, 1899, at Bolton-on-Dearne, the applicant sustained an accident whilst engaged in taking a sprag from the wheel of a steam navvy, when his right hand was caught between the sprag and a block of wood. As the result of the accident the palm of applicant's right hand was badly cut and he lost half of his first finger and the whole of his second and third fingers on the right hand. At the time of the accident his wages were 23s. per week. The claim was for 11s. 6d. per week, being 50 per cent. of his wages, or the maximum sum recoverable by the Act. The respondents admitted liability and submitted to an order for payment of 11s. 6d. per week from the date of the accident until Saturday, December 16th, by way of payment for total incapacity, and a sum of 11s. 6d. per week from that Saturday forward during partial incapacity, or until the same shall be ended, diminished, increased, or agreed in accordance with the Workmen's Compensation Act. The judge made an award on the terms asked for with costs.

Masters and Men.

The Aberdeen Building Trades, which have enjoyed so long and so remarkable a period of prosperity, are at present somewhat dull. The number of plans of new buildings brought before the Town Council in recent months has not been quite up to the average, and it is well known in the building trades that a considerable number of plans which duly received sanction are not likely to be carried into effect—at least for some little time to come. An element operating towards this result has been the recent rise in the price of money, and the difficulty of finding money at a sufficiently cheap rate to enable the various parties to proceed with building operations. Another reason is, doubtless, the fact that, in certain quarters of the city at least, the number of new houses provided has exceeded the demand. At the present time, in consequence, an unusually large number of operatives connected with the building trades, but building masons especially, are idle in Aberdeen. This is not wholly due, however, to depression in Aberdeen. A very considerable number of masons have been driven home from South Africa by the war, and these have swollen the ranks of the home unemployed to a considerable extent. It is understood to be the intention of these men to return to South Africa when matters there have been brought to a settlement, presumably in the spring, but meantime their presence in the city accentuates the otherwise very distinct impression of dullness in the trade. It was to be expected that the present condition of things would have some effect on wages. In the joiner trade a movement in that way has already taken place. Formal notice has been served by the employers that, owing to the slackness of trade, a reduction of a halfpenny per hour will take place in the wages. Three months' notice is necessary under the by-laws of the trade, so that the change would take effect between two and three months hence. The notice is at present under the consideration of the various operative organisations. No definite step in this direction has yet been taken in connection with the mason branch of the building trades, although the matter is being considerably talked about privately.

The Workman's Progress.—Mr. G. H. Wood, in a paper read before the Statistical Society last week, endeavoured to arrive at a new estimate of the real progress of the working classes during the last generation. His estimate was based not alone on a consideration of the wages they earn, or of their wage-earning capacity as measured by the amount of employment they obtain, but on the purchasing power of their wages. The computation of the wages themselves was the least difficult part of Mr. Wood's task. He showed that in spite of a serious drop after the year 1874, when wages, after being 40 per cent. higher than at the beginning of the period considered, dropped 13 per cent., yet at the end of the period considered they were in 1896 almost at the 1874 level. One might say that they were, in fact, 40 per cent. higher than in 1860. But there was another consideration: and that was the quantity of employment, which is subject to sudden large drops owing to trade depressions, and must be subject to occasional temporary drops owing to the introduction of machinery into a particular trade. The amount of employment per man was about the same; it was certainly not more regular, and seemingly less so. The third important consideration was the purchasing power of the workman's wages. Measuring this by his consumption of commodities (wheat stuffs, meat, tea, coffee, beer, spirits, tobacco, cotton, wool, sugar, &c.), an enormous increase was to be found, amounting to about 45 or 50 per cent. However, this 45 or 50 per cent. increase in the consumption of commodities by the workman was only about half the real advantage he might have been expected to gain from the real increase in the purchasing power of money, which has nearly doubled. Mr. Wood's general conclusion was that, although there has been a real advance in the standard of living during the generation, yet only in the last ten years have the signs of progress equalled those which culminated in the high tide of prosperity in 1875. He also pointed out that, according to the law of periodic inflation and depression, our period of prosperity was now nearly at an end, and there were some signs that it was to be followed by a period of stagnation—as after 1875.

Surveying and Sanitary Notes.

Euston Station is proposed to be extended so as to front on Euston Square. A Bill will be promoted in Parliament next session.

New Water Scheme for Shrewsbury.—At the last meeting of the Shrewsbury Town Council a report was presented by the Water Committee relative to a scheme prepared by Messrs. Taylor, Sons and Santo Crimp, of London. The gathering ground is situated at Batchcott, on the Shrewsbury side of the Stretton Hills. Its area is 2,040 acres and the supply is to be sufficient for a population of 35,000, at thirty gallons per head per day. The water would flow by gravitation from a capacious storage reservoir to filter beds at Bayston Hill, and then on to the town, three miles away. The estimated cost is £155,000. It was decided to submit the matter to the Finance Committee.

Sewerage and Paving at Gainsborough.—Some time ago the Urban District Council of Gainsborough adopted a scheme for the repairing of certain streets at the estimated cost of £4,800; but the Local Government Board withheld sanction pending receipt of information as to the condition of the sewers, gas and water pipes in the streets in question. In his first report, dealing with the district embracing the streets to be repaved, the Council surveyor (Mr. H. Riley) states that the sewerage system of the Urban District consists of ten distinct drainage areas, each having its own outfall, where the crude untreated sewage is discharged direct into the River Trent. He found the sewers to be in a much better condition than he anticipated; but points out that should a heavy and prolonged rainfall occur at a time when the river is high, the main sewers become choked and the storm water issues from the gully grates in the streets. In one instance this was undoubtedly owing to the surface water from the Great Central Railway and the new cemetery, which are higher than the town. The surveyor remarks that, although the Rivers Pollution Prevention Act does not require the purification of sewage discharged into tidal waters, he is of opinion that some day the law will compel the adoption of a more modern system. Whilst, however, he does not seek to justify the present primitive method of sewage disposal, he mentions that it is simple and convenient, and there is no reason to fear immediate evils arising from it. As to the repaving of the streets in question, he states that the scheme has been in hand since 1897, but mainly owing to circumstances over which the Council have had no control, a start has not yet been made, notwithstanding that complaints are received almost daily of the very bad condition of the streets.

TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.

J. G. FAULDS'

IMPROVED

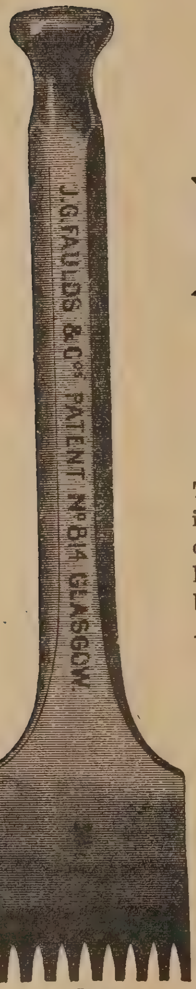
Multiplex Stone-Cutter.

Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.

These IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

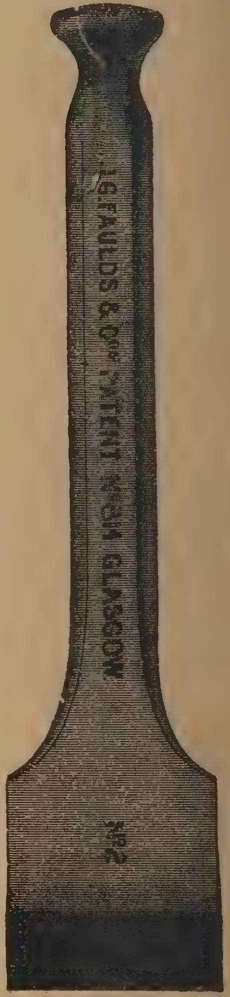
The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.



J.G.FAULDS & Co.s PATENT No 814 GLASGOW.

2" Drove, showing Cutter in Slot.



J.G.FAULDS & Co.s PATENT No 814 GLASGOW

Bricks and Mortar.

The Past Year. THE year that has just closed has not been altogether a remarkable one from the architect's point of view. No building of superlative merit has been built, no new genius discovered. The London improvements, of the first importance—the widening of Parliament Street, the erection of the new Government offices, and the new street from Holborn to the Strand—owe their initiative to a previous year, while the year is yet some distance ahead that can claim their completion. Meanwhile, much work of importance is going on—Christ's Hospital, the Catholic Cathedral at Westminster, Art Galleries at Glasgow and Liverpool, and in London the South Kensington completions, baths at St. Pancras, Bethnal Green, Fulham, &c.

It is evident that the nineteenth century is going to end without a distinctive style of its own; let us hope the twentieth will fare better. At present we seem to be at the height of what is called the English Renaissance, of the keystone variety, which this year has been most pronounced, and which seems to be the style that has the best chance of success in competitions. In domestic work, however,—the small country house—the end of the century seems to have evolved a style which, being founded on common sense, will probably outlive the English Renaissance, and many more fashions as well. Indeed, these small country houses will outlive much more pretentious work, and will probably be remembered as the only genuine architecture of the year.

The important competition of the year was that for the re-building of the law courts at the Old Bailey, for which half a dozen of our most successful men were invited to compete. Of open competitions the most important were those for the Kursaal at Harrogate, the Cartwright Memorial Hall at Bradford, the markets at Leeds, and the Municipal Buildings at Plumstead, all of which were keenly contested and carried through in a straightforward manner. At the end of the year comes yet another, of much importance, the Municipal Buildings at Walsall, for which one-sixteenth-scale sketches are required in a preliminary public competition. A selection will be made of the five best designs, and their authors will be paid £100 each to elaborate them. This is an arrangement which would have saved an enormous waste of time and money in the Plumstead Competition. Indeed, there is room for much improvement in the management of large competitions. Public opinion is not altogether satisfied with a single assessor, and inclines to the employment of three or more; and demands also a more definite understanding as to the lines on which designs should be judged.

In what may be called professional politics the question of registration has again come to the front, and been written about and discussed, only to be shelved again indefinitely, as far as one can see. It is possible, however, that there is a force of opinion slowly growing in its favour, which will make it necessary to take some action in the matter before very long. At present the Institute makes no sign.

The profession has lost some prominent men during the past year, conspicuous amongst whom were Sir Arthur Blomfield and Professor Banister Fletcher; while but the other day died Mr. Dollman, who was at one time well known in connection with church work and all matters ecclesiastical. On the whole, it seems to have been a good year for all concerned with the building trade. Builders have been very busy, and architects seem to have had their share of work. Quite recently, however, there seems to be a slackness among architects, and there is no doubt that the present war will affect them adversely, even if it has not done so already. Prices are still high, though there seems to be a fall in stock bricks. Rumours are about of the formation of a ring or corner in Portland cement. The speculative builder, we hear, will be hard hit by the rise in the bank rate of interest on advances. Bills will only be renewed at a higher rate. The small man, who is now just managing to keep himself going, will be seriously affected. But while he continues to put up so much work of the jerry-built and shoddy sort, he cannot expect a great amount of sympathy from architects.

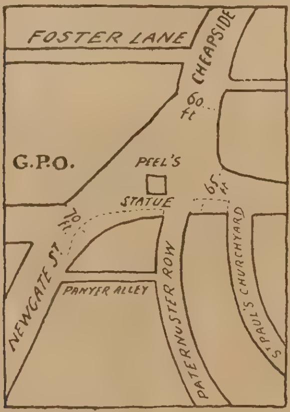
"LA DANCE": A GROUP BY CARPEAUX AT THE PARIS OPERA HOUSE.

A City Improvement. THERE is only one point in the City of London more constantly blocked than the eastern end of Newgate Street, and that is the wide area between the Bank, the Mansion House and the Royal Exchange. It is anticipated with some degree of confidence that the Central London Railway, now nearly completed, will considerably relieve the thronging traffic of the City; but at certain points there can be little doubt that the new line will actually bring a greater congestion of pedestrian traffic. Such places are the sites of the new stations, to which, when the railway is opened, great streams of traffic will naturally converge. The General Post Office Station will be situated at the narrowest end of Newgate Street, at the corner of King Edward Street, and already the thronging traffic that converges from Aldersgate Street, Cheapside, Paternoster Row and St. Paul's Churchyard has become so unmanageable that the Commissioners of Sewers are undertaking a public improvement here. It must not, however, be supposed that the work has only recently been suggested. Thirteen years ago it was seen that this busy junction of thoroughfares would have to be enlarged, and even then it was computed that no fewer than 30,000 vehicles and 100,000 pedestrians passed daily, and certainly the traffic of the City has grown enormously in the interval.

Post-office business alone is responsible for a large proportion of this undoubted increase, for the van-yard of the General Post Office discharges directly into Newgate Street and it needs only to refer to the Postmaster General's annual reports to learn how enormously the business of that department has increased of late.

When the Commissioners of Sewers were petitioned, thirteen years ago, to widen this narrow pass, they reported, after due enquiry, that the improvement was eminently desirable, but that they could not recommend its being carried out at that time while the costly widening of Ludgate Hill was still in progress. There was then no other public body in a position to share the expense, for the London County Council had not been brought to see the value of the proposed widening to the Metropolis as a whole.

In May, 1893, however, the Court of Sewers decided that the time had arrived for some action to be taken, and eventually a plan was laid before the County Council, with whose officials a prolonged conference followed, of which the outcome was three schemes for widening. Towards that finally agreed upon the Council consented to pay half the total net cost of £155,950.—Notices to treat have for some time past been served upon the owners of property scheduled for demolition, and during the past year the tall block of buildings facing St. Paul's Churchyard, Cheapside, and Paternoster Row has been demolished, opening up a grand new view of the Cathedral, a view which unfortunately will almost wholly be built in again, as the setting back of the line of frontage at this point will only be 20ft. The accompanying plan will clearly show the improvements to be made. It would, of course, be idle to contend that this measure will do more than to temporarily alleviate the daily block of traffic here; and indeed we only "improve," it would seem, for our own period, leaving the coming generations to bear their own burdens. But it is difficult to see, considering the prohibitive cost of land here, how even the wealthy City authorities and the County Council acting together could afford the outlay necessary for any permanent improvement, unless aided by a grant from the Government, which, indeed, considering how greatly the Post Office contributes to the congestion, might reasonably be expected.



The chief results of the works now to be undertaken will be that the narrowest part of Newgate Street will be widened to 70ft. from wall to wall, instead of 44ft. as at present; while the space between the back of Peel's statue and the corner of Paternoster Row will be 43ft., as against 31ft., and a width of 65ft. will be given instead of the present 45ft. at the junction of Cheapside with St. Paul's Churchyard. If not a heroic remedy, nor one of any permanency, it will be at least a great relief while it lasts. But before another fifty years have gone it will have to be all done over again.

C. G. H.

On Reflection.

An Editorial Greeting.

Whether we have yet begun a new century or not is a question upon which there seems to exist a curious diversity of view. We have our own opinion, but as the German Emperor and the Book of Common Prayer—to say nothing of less exalted authorities—may be quoted on the opposite side, we do not presume to dogmatise on the matter. Our readers will decide the point for themselves according to their several predilections. We have not yet, however, heard of anyone, who is prepared to dispute that we are entering this week upon a new year; and that being so, a word of greeting from the Editor to his readers will not be considered out of place. We have to acknowledge many kind, seasonable greetings, and to wish all our readers—the unknown thousands as well as the few who are personally known to us—a bright and prosperous New Year. The growth in popularity of the Builders' Journal and Architectural Record during the past twelve months has been phenomenal; we doubt whether any other trade or professional journal could boast of an equally large proportional increase in circulation. We attribute this gratifying progress very largely to the fact that our readers, appreciating our efforts to improve the Journal, have introduced it to their friends who have in very many cases become subscribers. We venture to hope for many repetitions of this kindly service during the coming year, so that with a still increasing circulation we may be able to introduce still further improvements, and realise our aim of making the Builders' Journal unquestionably the brightest, the most interesting and the most useful periodical for all connected with the architectural profession or the building trade.

The New Vauxhall Bridge.

We are pleased to find that, although met with several rebuffs from the London County Council, the council of the Royal Institute of British Architects have not abandoned their endeavour to obtain a bridge across the Thames at Vauxhall that would be a credit to London, and an example and precedent for the building of bridges in the future, in the provinces as well as in London. The Institute have sent a letter to the L.C.C. at the beginning of November, thanking the Council for the courtesy shown the delegates who examined the drawings and models, and in this letter make several excellent suggestions for the amendment of the design. There is no good reason why any objection should be raised by the Thames Conservancy to the suggested increase of width in the main piers, although we fear the suggestion will not be adopted by the Council, owing to the contract having already been let for the foundations. Another good suggestion is that the great projection of the cutwater in front of the pier seems unnecessary in so wide a bridge, and that a flat band with slight projection would serve its purpose better than the large projecting capping; the form of the weathering is also unsatisfactory. The other suggestions are that: (1) The semi-circular projection on the piers should be treated as part of the pier, and not as an attached column. (In the present design the stopping of the neckings to cap and base against the rustication is very awkward, merely as a matter of detail.) (2) The projecting quoins at either side of the pier upon the flat spandril of the arch have no significance and no architectural value, and should be omitted. (It is a question whether it would not be a distinct improvement to the pier to omit altogether the semi-circular column upon the face of the pier and the detached column it carries, and to treat the pier as a square one to the same design as the flat portion now indicated, but with greater projection. This would obviate the awkwardness of the raking lines of the caps of the circular columns which has been ignored in the model and $\frac{1}{4}$in. scale drawing.) (3) The arch, although increased in depth, is still painfully thin in appearance. Some expedient should be adopted whereby the voussoirs can be deepened. (4) Having regard to the weakness of the arch as designed, the council of the Institute think it inexpedient to emphasise it by the heavy rustication. The treatment of Waterloo Bridge might be studied with advantage as regards both arch and spandril. (5) There is nothing to show how the granite is returned under the soffit; the voussoirs should be properly bonded as quoins on the soffit. (6) The alternate narrow and broad dies in the balustrade have a restless and unmonumental appearance; they would be improved by being of one size throughout. They suggest that it is open to question whether a solid parapet would not assist the appearance of solidity which the design now appears to lack.

Not a Question of Professional Dignity.

Generally speaking, the Institute are of the opinion that the architectural treatment and detail of the design for the bridge lack that distinction of style and scholarship which may be reasonably looked for in a great monumental work of this kind. The letter concludes with an expression of satisfaction that the apparent intention is that granite of one colour is to be used for the whole structure. A reply to this letter has been received from Mr. C. J. Stewart, Clerk to the London County Council, in which he states that the criticisms and suggestions will have the most careful consideration, without impairing the responsibility of the Chief Engineer for a structure which necessarily, and in accordance with every precedent, falls within the business of his department. Very great advantage would have accrued if competent architectural advise had been first sought and the engineer not reckoned upon for architectural taste. It is no disparagement to the engineers to say that they have not the knowledge—obtainable only by a long and arduous study—which is required to deal with the architectural treatment of any works of this kind, and, therefore, no question of professional dignity should be brought in. There is no reason why the architect and engineer should not work together, and no architect would wish to trespass on the structural side of the work, which, as Mr. Stewart rightly says, falls within the province of the engineer.

A PHOTOGRAPH FROM LIFE.

The Study of the Human Form and its Influence on Architecture.—I.

By A. R. JEMMETT.

ARCHITECTURE demands from those who would follow it worthily an amount and a variety both of scientific knowledge and artistic attainment well-nigh superhuman.

Vitruvius, writing at the time of Cæsar Augustus, tells us what acquirements were considered necessary to an architect in his day, which, in good truth, are enough to satisfy the ambition of most men; but since the birth of modern science and thought, the man who proposes to acquire a mastery over every branch of his art is bold indeed. For, when we come to think of it, a complete mastery over architecture signifies nothing short of a complete mastery over the vital and essential things in the whole of our knowledge of nature, and in the sum of human experience. For the limits of art are no less than the limits of human endeavour; and to fully express life we must first have lived it and known it.

Architects, therefore, of the present day generally content themselves with gaining an intimate knowledge of those branches of their art for which they are most fitted by their tastes and natural endowments. Indeed, when we consider how rare is the combination in any individual of such opposite qualities as imagination and judgment, both of which are essential to a great master, we see at once that this restriction is but a natural result of the infirmity of human nature, and the appalling shortness of life. That art is long and life is brief, is a truism to some—but never to the architect. The struggle for existence, increasing in severity from year to year, compels many—who would otherwise desire to cultivate architecture as an intellectual pursuit—to attain such superficial acquirements as are most marketable, to the neglect of such as are not.

A study that for this reason, perhaps, has been almost entirely neglected by architects in this country is that of the human form. It is pre-eminently one whose fruit is not immediately marketable, or helpful to a successful career as money-maker; or, it may be that as its inspiration for the architect is more indirect than that for the painter or sculptor its value has been more easily ignored. Be this as it may, so long has it now been neglected that by the majority it has been entirely overlooked, and by the minority regarded either as unnecessary or as a counsel of perfection, according to each man's particular point of view.

It is not the intention here to discuss at much length, or to insist too strongly upon, the necessity to the artist of the direct study of nature. This much, surely, may be taken for granted. For the works of the architect, like those of all other creative artists, are necessarily founded on the works of nature, the best being those which show the firmest grasp of the laws which govern these works, and which are, so to speak, designed on the same principles. Where this has been accomplished, wide must have been the range of observation, logical the reasoning, and catholic the sympathy. In all the works of creation there is none more beautiful than, none that can compete in interest with, the human form, for it combines in itself something of the beauty of them all with the human interest that is peculiarly its own; as the old philosophers expressed it, it is "a microcosm of the world."

The advantages to the architect in this study may be briefly said to consist, not only in the help it affords in acquiring the power to draw, but principally in its influence over the mind and taste, and so ultimately over design. There is no intention to assert that this is the only or even the best way to learn to draw. It is possible to learn from a coal scuttle, and possible to study colour and tone from the same object. But it must not be forgotten that when drawing from the figure we not only improve our drawing, the means whereby we express ourselves, but we learn at the same time to familiarise ourselves with the structure of the human form.

The words "to draw" are not used here, as they seem to be too often used by architects, to express merely the ability to rule straight lines with confidence, or to make pleasing but possibly inaccurate pictorial representations of one's own or other persons' designs. "To draw" might rather be defined as the power to put things in their right places in relation to other things, or to give to colour its proper form.

For the whole of creation presents itself to the eye as an arrangement of colours of different values and in different positions. "To draw" is to give these colours their proper forms, to determine the exact space each one occupies, to put them in their proper places in relation to one another—to do this with a sense of beauty is to draw artistically.

The works of the architect appeal to the eye as arrangements of colour, to which have been given certain forms; every feature and detail affects it simply as so much colour, occupying so much space. However delightful a colour may be in itself, it is of no use, and less than no use, in a composition unless it is the right colour, of the right value, and in the right place. As the eye more easily appreciates the shape of a colour—its form—than its value—objects being generally recognised more by their shape than their colour—it seems to demand, first of all, that the form be right. In a design, therefore, the first thing is to get the objects—the colours—into their proper places in relation to one another, or what is the same thing, to give them all their proper forms. To do this is to draw.

Now the more a man draws the better will he do it, and the more he draws Nature the keener will be his appreciation of the beauty and reasonableness of her works. The more he feels this the more beautiful and reasonable will his own ideas become, and the better he draws the better he will be able to realise them. This is the direct value of drawing to the architect, as a means to an end, not so much to be able to represent the things he sees for their own sake, as the things that he imagines. If he cannot do the first, it is hopeless to expect him to do the last, and if he cannot draw what he has in his mind, cannot realise his conceptions, of what good are they to himself or to anyone else?

As an example of magnificent draughtsmanship in modern work, consider the principal façade—the mask—or, indeed, any façade of the Opera House at Paris. On looking at this one feels that everything is exactly and absolutely in its right place, that every colour has its absolute and inevitable form, that the slightest alteration of any proportion would be for the worse. Apart from any question of power and grasp of mind or soundness of judgment, of splendour of imagination or delicacy of sentiment, it would have been quite impossible to produce a work such as this without having acquired a masterly power of draughtsmanship, and unerring certainty both of eye and hand. To acquire such certainty, however brilliant the natural gifts may be, requires a long and strenuous effort, which involves a severe discipline to the mind and character; and though—as was acknowledged before—it is possible to obtain this discipline on other things than the human form, yet it seems probable that no other study can carry us quite as far.

What, then, should be the architect's method of studying the human form, and where should it differ from that of a painter or a sculptor? A figure painter or a sculptor, or again a surgeon, each would say that the study of the figure, even from his own particular and limited point of view, was sufficient work for a lifetime; and so it is. It is obvious, therefore, that an architect can never expect to know it just as they know it, not because he feels that it would be no use to him, but because life is so short, and there is so much more to learn of equal importance. What he has to do then, is, in the limited time at his disposal, to get a grip of the essentials, to drag out the underlying principle of the thing, the reasons why and

A TWO HOURS STUDY. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

wherefore; to understand the point of view of the painter, the sculptor, and the surgeon, to compare them with one another and generalise.

In this way, while not knowing it just as they do, he may possibly end in knowing it better. Surely this should be our attitude towards all branches of knowledge, impossible as it is that we should do all, and know all. The philosophers, the men of science, the workers in whatever branch of human thought and endeavour, they bring us the ideas and the knowledge we could never obtain without them, they provide the materials with which we rear a stately temple and an altar to the service of our art.

In order then to go straight to the vital essence of the subject, it is necessary to approach it in the right attitude of mind, to get a true conception of it, to work in the right spirit. The architect must remember that he is a creative artist, not an imitative one, that his aim is not so much to draw figures as to design them, which involves drawing them first; and that finally his ultimate goal is to design other structures on the same principle, which involves understanding them first. He must regard a figure not only as a beautiful arrangement of colour to be imitated, but also as a perfect structure, a living organism, to be understood. He must approach it not only from the point of view of the painter, but also from that of the comparative anatomist; must see it as one in a series, must compare it with other structures, must try and apprehend its real significance and importance in the scale of creation. For it should be noticed that, whereas to the painter or sculptor the figure in a composition is the principal or the only thing, to which all else is subordinate, to the architect it is not so. Whereas, in the conceptions of the poet or the painter it is a human being first and foremost, in those of the architect it is a mass of a certain weight and value, a line of a certain direction and importance first, a representation of a human being afterwards. The architect has to design figures to take a subordinate place, to sink into the main composition, to have their proper relative values to other things, neither more nor less. He has always to design it with reference to other things, to conceive of it as a part of the general design, not as a whole; he must therefore study it in the same way. He must not only endeavour to see it as in itself it really is, but above all things to see it in its true position as part of the general design of the universe. He must regard man, not only as "a forked radish with a head fantastically carved," or "an omniverous biped that wears breeches," but also as "a soul, a spirit and Divine apparition," and "unutterable mystery of mysteries." It is precisely this power of seeing everything in its true proportion to other things, of judging the relative value of everything, of grasping life as a whole, that is the test of the power of the creative artist, whether poet or architect; that makes the radical difference between a Shakespeare and a Shelley. The master minds have ever been those

> Who saw life steadily and saw it whole.

A TWO HOURS STUDY. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

There is needed a certain power of detachment, a power to get outside the world and calmly contemplate things from a distance, before we can get at their relative importance. With this subject in particular, so subtle is its growing fascination, that there is a danger of our studying it more for its own sake than for the education it brings. However fine a thing it may be to paint a head like Velasquez, or Rembrandt, it is a finer thing to design. When we consider one of these heads, though we can see that the subject has been summed up and presented in a way that is wonderful almost beyond belief yet we cannot but regard it as a life study—magnificent, doubtless—but still, after all, really a life study. Where such work ends, the designer's work begins.

There is a charm about the painter's life and its surroundings which appeals to us all, but no one who realised the possibilities of architecture could ever be content to abandon it for painting. We must see these things also in their relative proportions.

This faculty then of giving everything its relative importance, of putting everything in its right place, this critical faculty of mentally drawing everything, is one which we need to insist upon and cultivate to the utmost, for it is of the very essence of our work. Considering how powerful is the appeal to the senses of colour and form, we are tempted to be content with these, to neglect the faculty of judgment, and to rest satisfied with what appeals to the eye alone, the charm of physical beauty. But physical beauty, however seductive its appeal, can never by itself entirely satisfy, unless it be the outward expression of the inward intellectual and spiritual beauty—the real, the supreme beauty. Beauty of idea and of sentiment are finer things than beauty of form or of colour. To get the right idea in a design, to treat the subject in the right way, to feel its true, its natural sentiment, that is what we have first to do; neither subtlety of proportion nor delicacy of detail, neither wealth of material nor harmony of colour, none of these things will ever save a design which is not first of all true in sentiment and idea. To the human form we must turn, if we would see the perfect combination of the beauty which appeals to the eye with that which appeals to the heart and mind, for forms which not only charm in themselves, but which are the right forms in the right place. It is there we shall see the highest example of all that a building should be, the very perfection and ideal of structure.

At the present time anyone who insists on the claims of clear logical reasoning to play an important part in the work of the artist feels he is as a voice crying in the wilderness. For this very reason it is necessary to insist on a truth, which might otherwise be considered a truism. The architect has not the same licence as the poet or the musician; he has to reckon with the law of gravitation, to put out a hand and operate on nature. Art demands from him his whole endeavour, the consecration of all his faculties, the reason as well as the emotions. It is when the reason is bathed in the fire of the emotions that he feels the glow of inspiration. If imagination is the lightning flash that dazzles and blinds, criticism is the hidden force that drives it.

We must, therefore, not only feel, and feel intensely, the beauty, the poetry, of the human form, but also keep on the watch a keen searching critical faculty, analysing, comparing, generalising, probing for hidden reasons, searching after principles, but ever with an abiding sense of beauty. This is the way to understand; afterwards we can get to our real ultimate work—the work of synthesis, of re-creation.

A ONE HOUR STUDY OF A HEAD. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

But though we have all mental gifts, and all knowledge, these alone will not suffice. Nature reveals her deepest mysteries only to those who, to the intellect of the man and the sympathy of the woman, add the simple teachable disposition of the child. Such are they whom she "whispers in the ear."

(To be continued.)

Chester and its Walls.—In the course of a recent lecture on "The Roman Walls of Chester," before the Chester and North Wales Archæological Society, Professor F. Haverfield, of Oxford, said it seemed possible that the original walls of Chester were earthen walls about 50 A.D., and that these were not superseded by the stone walls until the latter part of the second century.—Dr. Stolterfoth suggested that the great thickness of the ancient walls facing the Roodee indicated that this had been a landing place or quay for the vessels which came to Chester, and the lecturer concurred in the opinion.—Mr. Henry Taylor took the opportunity to complain of the disfigurement of the ancient beauty of Bridge Street by the erection of a new building at the corner of Commonhall Street, faced with conspicuous yellow glazed bricks. A resolution was passed drawing the Corporation's attention to the matter.

Hull Town Hall.—At a recent meeting of the Property Committee of the Corporation the minutes of the Town Hall Sub-Committee came up for confirmation. They stated that at a meeting held on October 12th it was resolved that the City Engineer should prepare an estimate of the cost of the reconstruction of the Town Hall, and that designs and plans should be invited by public subscription, the premiums for the design being fixed at £300, with a second premium of £200 and a third of £100. At a meeting on December 19th the City Engineer submitted an approximate estimate, which, with fees, amounted to £120,000. The Property Committee resolved to appoint a consulting architect and assessor. At a meeting of the Finance Committee the project was regarded with disfavour in consequence of the expense, but the resolution was entered upon the minutes, and it was resolved that, upon the scheme being passed by the Council, application should be made for sanction to borrow the money.

MURAL PAINTING.

By ELMER E. GARNSEY.

THE following is a summary of a paper on "Mural Painting in its Relation to Architecture" by Mr. Elmer E. Garnsey, read before the Thirty-third Annual Convention of the American Institute of Architects, held at Pittsburgh:—I will begin with a negative definition. In the first place, mural painting *is not* the mere application of tints to architectural surfaces. Yet I venture to say that to many architects this whole question is a mere afterthought, left to the dregs of their appropriations of time and money. Some architects would seem to consider it but a concession to the weakness of their clients; considering, themselves, that any interference with the whiteness of the structure is a thing to be regretted. Under such haphazard influences, having passed through the gloom of the "black-walnut period," we seem to have emerged into an era of "white and gold," which has not inaptly been termed "the last resort of feeble minds;" it might otherwise be termed the first—imagine St. Mark's or the Capella Palatina done in white stucco, with only the decorated members picked out in gold.

The colour of a building is an important factor in its effect. And mural painting, as the application of colour to architectural surfaces, is not a matter of caprice, and still less is it of secondary importance. In the use of architectural forms, there is a reason for their employment; precedent and the inevitable logic of new conditions influence the choice of details and the use made of them. By no means the least of these details is *colour*. In the form of your building, colour bears much the same relation as it does to the human form; it distinguishes the living from the dead. When I speak of the colour of the human body, it is not of the application of artificial cosmetics to the complexion, but of the varying tints which play over the surface of the healthful body, not only differing according to the actual surface but corresponding to the different play of the muscles underneath. In a word, the colour of the human body is *organic*. Precisely so should be the colour applied to architecture. Its values are threefold. Colour should be *constructional* always. It is good if it is *expressional* also, and agreeable in *texture* and *tone*.

In regard to the constructional value of colour, the principle is recognised in exterior construction by the choice of materials. You continue to recognise it in the interior finish by the use of mosaics, natural woods, and metal work. Why then deny it to the applied colour treatment of constructive surfaces? If it is not denied in theory it is too often ignored in practice. That which supports weight should have the appearance of sufficient strength to carry the weight. Trivial or flimsy colour makes a solid wall appear to be so in reality.

Stresses and strains are reduced to an exact basis, yet the colour which clothes the construction receives but scant consideration. Certain architectural forms express clearly their purpose or origin; such as the dome, its pendentive, the frieze, and the lunette. The forms mean something in the building; the colours they bear must express that something, or their meaning will be lost. The dome crowns the structure, and suggests the heavens which are above the earth; therefore, its colour should relate to its structural form, and send it swinging farther up into the sky itself. The pendentives lock together the supporting arches, and in colour should appear to be as solid and resisting as they really are. The frieze binds the whole together, and must be a ligature of colour as well as of structure. The lunette is a resultant form, and may be treated with much greater freedom in colour than if it were a supporting form.

The second value claimed for colour is that it should be *expressional*. Nor is this entirely a sentimental consideration. Impressions are received through the senses, and certain colours create certain mental impressions or impulses. The blue of the sky dominates

A TWELVE HOURS STUDY OF A GASLIGHT EFFECT. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

every fair landscape, and we associate it with vast space and soaring height. It has been associated with religious faith from the remotest times, and the roofs and domes of both pagan and Christian temples bear witness to the sentiment expressed by it to man in all ages. The green of nature is reposeful; it reminds us of the cold depths of the forest and the peaceful quiet of the countryside. Yellow, the colour of sunlight, is joyous and brilliant, and within its scale lies gold, always a human attraction. Absolute black suggests negation; it is sad to us, and we'll ha' none of it. White, on the other hand, stands for purity, cleanliness of body and mind; and we associate it with angels and virgins. Red is an exciting colour, associated with festivity and "a hot time." We shall appreciate its value in mural painting the better after seeing Pompeii. The expressional value of colour is also associated with local and climatic conditions. New England has a different complexion from the south, and consequently demands a different prescription; while Old England and Italy are still farther apart in respect to colour expression.

The third value of colour includes *texture* and *tone*. What is called a "good job" of painting is infrequently a satisfactory finish for an architectural surface. Its smug perfection is inartistic. We resent the *paint*. Copy a tapestry—colour for colour, pattern for pattern—on a wall and hang the tapestry beside it. The one is tame and uninteresting, because it lacks the texture of the other. But how shall we achieve texture in paint on a smooth wall? It certainly cannot be done by the ordinary methods of house-painting, nor secured through the usual painter's specification. Different technique and processes must be employed. Scumbling or dragging an opaque colour over the surface, and then glazing with transparent colour, is one method; tricks and experiments, failures, and, finally, success, may be achieved by the expenditure of time and money. Tapestry and leather are also expensive wall-hangings, and texture in colour cannot be secured without proportionate cost, while it *may* be made as beautiful, in its way, as either of these, capable of honourable association with the finest woods and marbles, and the choicest products of loom and needle.

The Romans had a high appreciation of the value of architectural colour-decoration, and some consideration of the methods of Pompeian painting may aid us in the illustration of its principles. Many of even the smaller Pompeian rooms possess a wonderfully monumental character. There is little to be seen in them but the wall-paintings; the ceilings have disappeared, hardly leaving a hint of their construction. The mosaic floors are concealed by a layer of pumice and ashes; a few columns remain without entablature, and doors and windows are but crumbling apertures. Yet the scarred walls have kept their glories of colour for eighteen centuries, and *there* exists the greatest academy for the study of mural painting in the world to-day. The laying out of these wall-paintings is essentially architectonic in character and method; a dado or stylobate of dark colour, greyish, brownish, or purplish-black, the main wall-surface panelled with the primary or secondary colours, the style and rail in white or yellow, and the frieze above in some pale colour, white or grey. The general divisions were first laid on in broad, solid masses of colour, then the ornament, foliage or figure subjects were painted on them in a thick *impasto*, sometimes appearing to have been executed with a spatula, rather than a brush. Finally, the whole surface was rubbed with wax, and beautifully polished. These walls exhibit the value of colour in its application to architecture in the relations under which we have been considering the subject of colour. The colour is constructional, it is frequently expressional, and its texture and tone are superb. The ornamental forms with which the Pompeian walls are decorated do not always arise from their construction, but they are so invented and disposed that the wall is made beautiful, which is almost the best that can be asked of the mural painter. A sufficient suggestion is made of the structural character of the wall, but the painter did his work with the greatest freedom, not attempting to deceive us by a pictorial treatment, but preserved the vertical plane of the wall, while tracing upon it a pattern of perspectives, landscapes or figure paintings.

Tone in mural painting is that almost indefinable *saturation* of the whole work that, like the atmosphere of an Indian summer, melts the landscape into one delicious colour impression. The first impression one receives in the Borgia apartments in the Vatican, painted by Pinturrichio, is that of an exquisite tone or bloom which pervades the whole. A dusty-grey purple and equally dusty and grey gold seem to have crept over the whole interior. Nowhere does one or the other become a dominant colour-note. Everywhere they are both felt rather than seen. When we examine the technique of the painter we find that gilding has been carried through the entire work by such subtile means and by such rare judgment that there is almost a patina of gold over both the painted surfaces and the ornamentation in relief. The architectural forms introduced into the backgrounds, the embroidered hems of the costumes, the details of armour, jewellery and other accessories are modelled directly on the wall in slight relief, and everywhere this relief is touched with gold. Not only these, but the fruit on the trees, the flowers in the foreground, the distance, and even the sky itself have been brought under the same convention by carrying over them all a sort of diaper of little dots in relief, each of which is deftly gilded. By these means the eye is never allowed to receive an impression unaffected by gold. Again, by contrast with the dull yellow of the gold every other colour is tinged or affected by the complementary of gold colour, which is purple. It is by the judicious juxtaposition of complementary colours that this neutralized bloom is secured, and no painter, who may be called a colorist, can be ignorant of their value.

Mural painting is not only a question of colour, but of pattern. And by pattern we mean any sort of breaking-up of spaces by design; whether by lines, ornaments or figures. Much confusion exists in the study of design. The painter studies from the figure; the designer studies ornament. The architect studies both, but not in reference to colour. The whole matter of surface decoration becomes a question of pattern; and in taking up the subject, let us consider it under these three heads: *Pattern, Balance of Pattern*, and *Flatness*.

As soon as we leave unbroken planes and begin to cut them up in any way, by ornament, by figures, or by lines, we begin to work a pattern. The first condition that must be fulfilled on a painted wall is that it shall be an agreeable piece of colour. Then, is it ornamental? Does it cut up into a good pattern? Then, what is it all about? What are the names of all these gods and goddesses? Unfortunately, these questions are usually reversed. The use of the human figure in the pattern is valuable as a part of that pattern. The beauty of the pattern is not entirely dependent on the figure. A wreath or cartouche is equally valuable if properly used, and architectural motives, landscapes, and geometrical forms each have their value and place in good pattern-making.

The second consideration of pattern is *balance*: balance of empty spaces with detail, of colour with form, and of ornament with simplicity. The lunette form especially demands balance of pattern and stability of design. Its decoration should not appear as a procession that moves across it, emerging, apparently, from the frame at one side to disappear at the other. The frieze is the place for the procession. Its form demands treatment which shall suggest continuity or repetition; that of the lunette an arrangement that shall be complete in itself. For the wall that ends a vaulted ceiling stops the succession of arches or vaulting, and its design must express stability.

The third consideration of pattern is *flatness*. The word does not perfectly express the subject, which includes the much-discussed question of the wall as a solid and unpierced plane. The stricture is frequently made that the mural painter makes holes in the wall. There is no law, however, that defines how much flatness is desirable, nor are there rules as to how it is to be obtained. Absolute flatness and entire disregard of modelling would be wearisome to both the eye and the imagination. Absolute disregard of the wall as a constructive surface is equally offensive to the reason. Giotto's style is sometimes cited as the ideal technique for mural painting; but it must be remembered that Giotto painted in the way he did because he knew no other way. Nor are the conventions of Japanese of much greater value to the painter of to-day. The landscape painter seeks to destroy the actual vertical plane of his picture by leading us insensibly off into his aerial distances. The patterns of primitive peoples *are* perfectly flat, and at the same time quite incapable of inspiring lofty imagination.

Referring to the Pompeian walls, we often find a sort of linear perspective employed in their patterns. There is no attempt at actual illusion, yet in those small rooms the effect of these devices is to give us some suggestion of breadth. We are not led out through the wall into out-of-doors, but some impression of the outer world has been brought in to us. Architectural forms when treated in the grand style of Raphael's "School of Athens," do not offend us by any undue suggestion of extra-mural nature. That noble vista of arches, while it stimulates the imagination, is no panoramic or illusive background. It would seem, therefore, that while linear perspective may be reckoned as of much value in mural painting, aerial perspective had better be left to landscape painting.

The treatment of the figure in regard to flatness of execution opens up a still wider field of discussion; as precedents may be found for almost any degree of modelling, from an absolute silhouette to the frankest naturalism. Some painters satisfy themselves by using a strong outline around the figure, which is so evident a convention that it flattens everything within its boundaries, and allows sufficient modelling in a lighter key to express the action of the figure. The difficulty they encounter is that the strong contours thus obtained do not always form an agreeable pattern, and the gain in one quality is at the expense of another. Perhaps some study of the sculptor's technique might be useful to the mural painter, especially of such work as the low-relief decorations of certain Roman vaults and tombs. The contours are strongly marked in some places where the tool has cut deeply into the fresh plaster. Again, there is no line at all where the figure emerges from the ground, and its contour is entirely left to the imagination.

There are many ways of achieving beautiful results, and general principles, rather than dogmatic statements, should guide us.

St. Luke's Church, Bristol, has been reopened after renovation. The church was built in 1850 in the peculiar style of Gothic then in vogue and towards the decline of what has been called the "bare-wall period." A chancel was subsequently added, and now a suitable vestry has been provided and the church has been reseated. The chief feature of the present renovation, however, is an attempt to brighten and enliven the interior of the building by a well-conceived scheme of colouring. The cost of the improvements has been about £1,000.

Eastleigh Church has the distinction of being designed by three contemporary church architects of the first rank. In 1868 a church was built, mainly through the generosity of Miss C. M. Yonge, the architect being Mr. G. E. Street, and sixteen years afterwards an aisle was added from designs by Mr. J. L. Pearson. More accommodation being needed, it was decided to add a larger building, with which the older portions should be incorporated. For this extension plans were prepared by the late Sir Arthur Blomfield, which are now being carried out. £10,000 will be needed for its completion.

THE BUILDING TRADES IN 1899.

THE past year has been a year of great prosperity and progress in all branches of trade. Three years ago an era of trade prosperity began in England, and, if the familiar adage holds good, that trade runs in cycles of seven years, there should still be a lengthy period of exceptional industrial activity before the country. The year which has just expired has kept up the promise of unusual briskness with which it began, and each month has seen a steady growth in the volume and value of our national trade. The expansion has been confined to no single department and some industries that were threatened with extinction have been revived with some prospect of permanence. The economic conditions of the country have been sound, trade has been active, employment has been good, and wages have been high. As regards the labour market the number of men out of employment, according to the Trade Union returns, has been smaller this year than in any year since 1894. There has been about the usual number of strikes in the building trades, but none of very great extent. Below we give a few particulars relating to the state of the building trades during the past year in the more important towns. Reports have not yet come to hand from all the trade centres, but will be given in due course.

ENGLAND.

Barnsley.—There has been less activity in the building trade during the year, and with a growing population, there has been less empty property in the working class parts of the borough than was the case in 1898. In the business centres of the town competition has been keen enough, but values of property have gone up rapidly and a record price has been reached in the purchase value of shop property.

Birmingham and the neighbouring Black Country have had their full share of the trade improvement last year. Activity has been especially marked in the building, engineering, coal raising, and iron and steel producing trades.

Bradford.—Both the stone and iron trades have been busy this year, though the building trade, in its turn, had the misfortune to be seriously interfered with for some time, as the result of the plasterers' strike. Building operations are proceeding apace in the city, and there is no prospect of any decline in the present prosperous condition of affairs, in face of the projected public works, which include the Cartwright Memorial Hall, the Fire Brigade Station and the market extension. The prices prevailing during the year have been as follows: Self-faced flags, 2in. thick, from 2s. 4d. to 2s. 6d. per yard super., 2½in. 2s. 10d. to 3s. 2d., and 3in. 3s. 6d. to 3s. 10d.; tooled flags, 2in. thick, from 3s. 3d. to 3s. 6d. per yard, 2½in. 4s. 5d. to 4s. 7d., and 3in. 4s. 6d. to 4s. 8d.; ashlar, from 1s. 8d. to 2s. 2d. per cubic foot (dimension sizes), outside wall stones, 52s. to 58s. per rood, inside wallstones, 20s. to 24s., pitch-faced wall stones, 46s. to 52s. per rood; common bricks, 25s. to 30s. per M, at works. The following are the Corporation statistics, showing the number of dwelling-houses and others, being included in the 455 plans approved during the year ended September 30th, as compared with the previous year:—

	1898.	1899.
Dwelling-houses	1,146	1,216
Houses and Shops	63	52
Warehouses	32	9
Mills	2	2
Workshops	14	17
Places of Worship	2	2
Lock-up Shops	39	63
Sundry Bldngs.	521	441
Streets	47	41
Totals	1,866	1,843

In the timber trade prices are 33 per cent. above the lowest point of the last two or three years, and the supply has been inconveniently short. With regard to house-building in Bradford, it may be noted that the demand for property has been so good that many builders refuse to let. They have been able to sell as soon as the houses have been put up, and at remunerative figures. Buyers are easily found, and, with the help of the building societies, the number of property-owners is largely on the increase. With regard to the stone industry at Idle, it is a good many years since the demand was so great. The orders are more than the various firms can almost cope with, and, of course, this demand has had a corresponding effect on the prices. So far there is every indication of the present brisk condition of trade continuing.

Brighouse and Elland.—In the local stone trade, both at Brighouse and Elland, trade has been good, and a year that has scarcely been surpassed in demand for several kinds of material, chiefly paving stone (2½in. and 3in. flags), closes with very little stock on hand, and a ready demand for most of the varieties of stone quarried in the district. The open weather which prevailed until about three weeks ago, had the effect of enabling the local stoneworkers, of whom there are a very large number in these districts, to follow their employment. It is computed that over 300,000 tons of stone have been sent from the Brighouse district during the year by rail or boat, and most of this has gone to London, whilst large shipments have also been sent to Hull and Liverpool for conveyance abroad. Many new quarries have been opened in the district, principally at Hove Edge, and stone of good quality and in quantity has been found. The brick making trade has maintained its standard of production. In the firebrick and sanitary earthenware works at Elland the year has been a good one, the extensive sewage schemes that are being carried out in various parts of the country naturally causing a big demand for drain and sewer pipes. In the case of Brighouse it is generally recognised that the rapidity with which the local rates and charges have increased during the past few years has had something to do with retarding what would no doubt have been the phenomenal growth of this active and well-situated industrial centre.

Bristol.—The building trades have been brisk, but are likely to improve this year, owing to the large municipal schemes on hand. Bristol improvement schemes have in the last ten or twenty years unhoused a large number of poor people, the former dwellers in many undesirable courts and tenement houses, now happily no more. The duty of finding houses for these and for the ever-increasing population is being met by private enterprise, and the City Council have decided to build seventy small houses for poor people in view of the unhousing of a considerable number of people by street improvements. Another very interesting departure which has been resolved upon is the building of a municipal lodging-house in St. Jude's. Several schemes of street improvement delayed pending the settlement of other housing problems are now presumably free to proceed. A fine set of new baths are about to be erected at Barton Hill by the Corporation. The new library for Bristol North, the cost of which, including site, will be £13,700, has been commenced. A new school is being erected in Cheltenham Road. There seems a likelihood of the new municipal buildings, which are so badly needed, being begun this year. It is proposed to erect a large block of building in this connection, to house also a central library and an art gallery. In addition to the activity in municipal affairs there has been a large amount of industrial activity involved in church building and extension, the erection of schools and the reconstruction of the tramways. There has been a fair amount of work done in building offices, business premises and dwellings. Fine blocks of offices for insurance companies have in the last year or two improved several of the principal thoroughfares. The main thoroughfares in the suburbs are every year becoming more town-like, and the process of converting private residences into shops is still going on in Cheltenham Road, Gloucester Road and elsewhere. An important contract now in course of execution is that for the erection of Colston Hall from the first premiated designs of Messrs. Jones and Cummings, of London. The building it is hoped will be ready for use by October this year.

Halifax.—The various branches identified with the local building trades have had a busy and, upon the whole, a prosperous year. The extension of the borough and the adoption by the municipality of a system of tramways have given an impetus to building operations, and this has been very marked throughout the year, but particularly so during the closing quarter, when the demand for materials was unprecedentedly large. The extensive local brick and tile industries have been taxed to their utmost to supply district orders, and stocks were probably never lighter than at this December stocktaking. Taking the year as a whole, better prices have ruled, and double the quantity of building materials has been used as compared with the state of things five years ago. The new year will commence with considerable activity and a large demand for building materials, but circumstances are such that it is difficult to gauge the outlook. Prices are very high—some people think abnormally so—and, were a "slump" to supervene, trade would be dislocated for a time.

Huddersfield.—Builders have had as much work as they could get through. Few new houses have been erected, but there has been a great deal of work done in the putting up of public buildings. Trade was considerably dislocated for some months by the plasterers' strike and the lockout of 25 per cent. of the men in other trades for five or six weeks, and also by the local strike of joiners, who obtained an increase of wages. There are good prospects for the coming year. Contractors are hampered by the refusal of the Operative Masons' Society to allow stone to be worked in Huddersfield and sent out to other towns in Yorkshire (thus also checking the quarry trade), though large quantities are sent to London without objection by the trades union there.

Hull.—More plans have been passed for house property, warehouses, &c., than in the previous year. The dispute between the operative builders and their employees has resulted in less work being done, but it did not at any time stop the deposit of plans, especially for house property, and the dispute has resulted in the establishment of more speculative builders than existed before, for this class of men were able to go on with their work more or less regularly, the large contractors for public works being more particularly affected.

Keighley.—Building has been active in the borough this year. The street improvements have led to the erection of a considerable quantity of good shop property. Dwellings have also been put up in such numbers as to quite overtake the demand, and, with the hardening in prices of building material, some slackening is in prospect.

Leicester.—The march of the industrial year has been, on the whole, smooth. The chief exception to the harmony between employers and operatives has been the protracted rupture between the builders and the bricklayers' labourers. This was precipitated by a nominal demand for an extra penny an hour, but it was frankly intimated from the outset that the concession of a halfpenny would end the difficulty. This the employers refused on various grounds. Their workmen just as resolutely declined to be content with a farthing less. Attempt after attempt was made to end the dispute, but without success until Sir William Markby was called in through the friendly offices of Mr. Councillor Smith, and awarded the desired halfpenny. By this time, unfortunately, the strike had been allowed to drag on for no less than twenty-five weeks, and employers and labourers sustained losses which it must, in some cases, take years to repair. The lock-out in the building trade has not affected the number of plans passed for new buildings to any serious extent, as will be seen from the following table:

	1899.	1898.
New Houses	2005	2404
Alterations and additions	894	844
Shop Fronts	232	293
Sheds, &c.	163	161
Warehouses and Factories	87	73
Special Bldgs	36	43
New Streets	39	83
Totals	3456	3901

In municipal work a busy year has been experienced. The total value of the work completed in sewage work is close on £20,000, and new causeways in various parts of the town have been kerbed and flagged or gravelled at a cost of nearly £2000.

Leeds.—There has been much to contend against in the building trade, and for many of those engaged in it the year brought much anxiety. Out of evil, however, has come good. After the storm the calm, and, as freedom from labour troubles is anticipated for some months to come, a period of unexampled prosperity should be experienced. The trouble between employer and employed which marked the early months affected Leeds, in common with the rest of the country; while the local dispute in connection with one section of the bricklayers tended still further to temporarily paralyse what should, and would, have been a brisk industry. It is comparatively recently that work can be said to have got again into full swing, and even yet some big jobs are standing idle, as some have already stood, because of that litigious obstruction—ancient lights. Injunctions have been obtained in certain cases, to the confusion of builders and the annoyance of architects. Both builders and architects will, it is thought, require in future some protection against the consequent loss through delay and the payment of interest on money which for the time being is yielding no return. The value of materials has hardened, notably in the case of constructional ironwork, such as girders, and there has been a big demand for bricks. The erection of dwelling-houses did not suffer the same delay as other classes of work. This class of work is in the hands of the speculative builder for the most part, and as the speculative builder is not attached to the Federation he does as he listeth. The fireclay industry in Leeds has been prosperous. Local firms report that they have been kept fully employed throughout the year, and the prospects are of an encouraging character now that the troubles in the building trade, upon which so much depended, have been settled. It might have been expected that the recent strike would have had an injurious effect upon fireclay products, but as it was only partial, local firms were not affected to any material extent. The industry in Leeds at any rate did not suffer, and the local specialities in terra cotta, faience, glazed and fire bricks have been in as great a demand as ever they were.

Manchester and Salford.—The building trade in all its branches has throughout Manchester, Salford, and district been exceedingly brisk during the year. Wages have had a tendency to go up, and with one exception the year has been free from strikes or disputes of any magnitude. That exception was the sixteen weeks' strike or lock-out of the plasterers, who demanded an increase of a penny per hour, but eventually accepted a half-penny. Generally speaking, the volume of trade has been greater than previously. The prospects for the coming year are bright. Contractors have plenty of orders in hand.

Normanton.—The brickmaking industry has been prosperous. Many cottages—and the new ones are a better sort than the miners' dwellings of thirty years ago—are rapidly put up.

Nottingham.—The trade has been prosperous. On the outskirts of the borough a good many large estates have been bought for the purpose of converting them into building plots, and there has been a large increase of cottages and villas.

Otley.—The whole of the industries have been very busy, and there is every indication that the ensuing twelve months will be equally prosperous. This prosperity has resulted in building operations being carried on during the past year to a great extent, and a number of cottages and villa residences have been erected in all parts of the town.

Sheffield.—The great increase in building operations at the end of 1898 has been more than maintained and large contractors have been unable to take more work. In the centre of the city the rebuilding of High Street has been continued and is now almost complete. At several of the large works buildings of immense size have been erected, and in all the suburbs villa and cottage property has been built to an enormous extent, and as soon as completed the houses have been occupied. The new tram service is taking the working classes from the centre of the city and builders are making provision for them in the outside districts as rapidly as possible. The following table shows the number of the buildings erected within the city boundaries from the beginning of the year to December 21st:

	1898.	1899.
Length of streets with sewers	17,683 yds.	10,909 yds.
Plans of new sewers approved	—	16
Length of sewers approved	1,155 yds.	972 yds.
Houses certified	2,273	2,603
Other buildings completed	338	262

Wakefield.—The past year has been prosperous and the prospect is encouraging. Architects, builders, timber merchants and others engaged in the building trade have experienced a good year. The County Council have erected new acute blocks in connection with the asylum at a cost of nearly £100,000, and enlarged the County Hall, which has cost the Riding about £120,000. An unusually large number of shops have been modernised and enlarged during the year. New dwelling-houses, chiefly cottages, are springing up all round the city. Building land for the erection of better-class residences was somewhat of a drug, although there is a demand for that suitable for erection of artisans' dwellings.

Yeadon and Guiseley.—Building has been sparse at Yeadon, but at Guiseley there has been a considerable addition to the houses of a better-class character.

SCOTLAND.

Aberdeen.—The granite trade of Aberdeen has, in some aspects, been remarkable during the past year. In one respect as regards the number of new buildings actually added to the city the year has been one of the most prosperous ever experienced in the city, and yet at the present moment the granite trade is undergoing a period of altogether unusual dullness. This dullness has come somewhat suddenly upon the trade, and is due to various causes. The comparatively high price of money, which renders it difficult to operate in new buildings with a very fair prospect of advantage, is one reason, and another is the fact that more than an impression is abroad that in some quarters of the city at least something like over-building has been going on, and a decline in the value of house property may ensue. However, the existing state of matters does not seem to justify any alarmist view in this regard. The shrinkage that has been apparent in the building trades in the city has shown itself also in the allied granite monumental trade. As regards the home trade, a very good trade has been experienced; this is largely due to the continued development in the use of polished granite for architectural purposes. On the whole, the volume of work done at the Aberdeenshire quarries has been quite up to the average during the past year. In several of the quarries the chief difficulty seems to be to obtain sufficient supplies of suitable polishing material to meet the demand. As far as the settmaking industry is concerned, the year has been a very prosperous one. For both local and export purposes there has been a greater demand than there has been for a number of years past. Not only has the demand been exceptionally great, but the marketable value of the setts has kept very firm throughout the year.

Brechin.—The building and allied trades have been in a rather depressed state during the year, very little work, in the way of building, being done. The prospects for the ensuing year are, however, looking a little better.

Dundee. — The activity in the building trade so pronounced in 1898 has been fully maintained during 1899. It has been confined to no particular department, but, if there has been one particular direction in which it has been more manifest than another, it has been in the erection of tenements of houses for the accommodation of the working classes. While the bulk of such property has come into existence as a bonâ-fide investment, the speculative element has not been wanting. Present indications point to the conclusion that the needs of the city population in respect of dwelling-houses have been fully met for some years to come; indeed, an impression prevails that to some extent building of this class of property has been overdone. Wages in all branches of the building trade have ruled high. Regarding the outlook for the ensuing twelve months the prospects are that the high water mark has been reached, and that there will be an easing off of the pressure which has been steadily maintained for the past eighteen months. The work to be undertaken by the Corporation, representing a sum of about £300,000, will form a fruitful source of employment for some time to come.

Fife and Kinross.—The building trades in Cupar have been exceptionally busy. The masons, builders, and kindred trades were fully employed during the whole season in the Cupar district, and the prospects for 1900 are equally satisfactory. Building in St. Andrews has also been very brisk during the year, and in Kinross has been unusually busy.

Forfar.—There has been a lull in the activity of the building trades, so far as the town was concerned, but a larger amount of country work than usual kept these trades well employed.

Kirriemuir.—The building trade has been pretty active since the advent of spring, but still there is felt a want for the better class of workmen's dwellings, the building of which is no doubt retarded for want of suitable sites and the heavy charges for local taxation.

Monifieth.—A number of cottages and a large hotel have been erected; the drainage system is being extended, and new streets have been made and new roads opened up.

Montrose. — The building and kindred trades have had a fairly prosperous year. The wood trade has been in much the same state as during the preceding year; no cargoes of dressed timber have been shipped direct from the port to the Colonies for almost two years, which seems to indicate that this branch has fallen upon evil days.

Newburgh. — The building trades have been well employed during the year, several improvements having been carried out in the town. New Slaughter-houses are in course of erection.

Newport and Wormit.—The building trade in the district has been, if anything, quieter, after the great activity of preceding years.

Perth and Perthshire.—The building trade in the city has been very brisk and the wages good. New public halls have been erected at Pitlochry and Almondbank, and a new hotel at Kinloch-Rannoch.

Stonehaven has experienced a very satisfactory year in the building trade, which has for several years past been one of the leading industries of the town; altogether over £20,000 worth of work has been erected or sanctioned during the year.

Memorial Windows at Aberdeen.—A three-light memorial window has been placed in St. Mary's Chapel, Aberdeen. It is the work of Mr. Whall, of London. A three-light window has also been unveiled in Gilcomston Free Church, Aberdeen. This was designed by Mr. David Gauld, and made by Messrs. Guthrie and Wells, of Glasgow and London.

A Peculiar Summons.—An action was down for hearing at Marseilles last week which has been pending against the city for over thirty years. The plaintiff is the well-known sculptor Bartholdi. Many years ago he executed a monument for the city, but left it unsigned. He subsequently wished to add his name to it, but the city authorities refused permission, and after endless negotiations the present action is being brought to compel the Marseilles Municipal Council to allow the artist to put his name to the statue.

GLASGOW BUILDING REGULATION ACT, 1900.

THIS is the title of the Bill which is to be promoted in Parliament next session. It is divided into sixteen parts, and the following synopsis will serve well to show what conditions are proposed to be enforced in connection with future building operations at Glasgow.

The preliminary part consists of a number of definitions and meanings of many of the words used, such as "private street," "new building," "party wall," etc., about which so much litigation often occurs. By section 18, Part 2, dealing with streets, the Dean of Guild can refuse to sanction plans for a street which is less than 50ft. wide or which has a gradient steeper than 1 in 12. Section 26 provides that in the case of any public street more than 80ft. wide the Corporation can enclose a portion in the centre as ornamental or pleasure ground, leaving at least 25ft. on each side. In Part 3, which deals with through ventilation, free space, &c., section 35 requires every hollow square to have an opening not less than 15ft. wide and open from 15ft. upwards; but this does not apply where the buildings do not exceed four storeys in height, and have an enclosed background space containing not less than 1,800 square yards, and being not less than 90ft. across at the narrowest part; and where the buildings do not exceed three storeys in height, and have a background space of upwards of 1,400 square yards, measuring not less than 65ft. across at the narrowest part. Part 4 deals with sewers, drains, cesspools, &c., and in section 55 of the following part it is stated that every water-closet shall be supplied from a separate cistern having a capacity to give a flush of not less than three gallons. Building lines, sites and foundations form the subject of Part 6, and by section 61 no building may be erected, without the Corporation's consent, beyond the general line of buildings, in any street "where the distance of the line of buildings from the nearest part of the street does not exceed 30ft., or within 30ft. of the street where the distance of the line of buildings therefrom exceeds 30ft."

Section 67 (Part 7) limits the height of buildings, churches excepted, to 90ft., exclusive of ornamental towers, turrets, or other architectural features or decorations. No dwelling-houses are to exceed in height the width of the street (section 68), and in every building exceeding 200 square yards in area that is used partly for trade purposes and partly as a dwelling-house, fireproof division walls and floors are to be provided (section 71). Excepting one-storey buildings of brick, stone, iron, or other incombustible material, no warehouse shall, without consent, extend to more than 350,000 cubic feet without party walls (section 72). The construction of buildings is dealt with in Part 8, where section 75 stipulates that the safe carrying load, in addition to the weight of the materials, shall be 100lbs. per square foot of floor for dwelling-houses, 180lbs. for public buildings, and 224lbs. for warehouses and factories. A safe load on timber is to be held to be one-seventh, on wrought iron one-fourth, and on cast iron one-sixth of the breaking strain. No machinery or goods that exceed in weight 224lbs. per square foot of floor space are to be placed on the top floor of a building, unless special provision has been made for the purpose. Section 79 requires gables or party walls between tenements or self-contained dwelling-houses to be carried up 9in. thick to 12in. above the roof. By section 84, the enclosing walls of hoists or elevators are to be formed of incombustible material; by section 86, roofs are to be constructed of or covered with incombustible material; and, by section 87, every roof has to carry as a safe load a minimum weight of 50lbs. per square foot of surface, in addition to the weight of the roof itself.

By section 91, every fireplace opening without grate or stove is to be stopped up, and in all new buildings every stair having an open well-hole is to be supported by iron beams (section 93). The subject matter of Part 9 of the Bill is noxious and dangerous businesses. Part 10 deals with theatres and public buildings. Section 101 provides that no theatre or music hall accommodating more than 1,000 persons is to be built which is not distant 15ft., on three sides at least, from the nearest building; the auditorium floor is not to be more than 3ft. above the street level; and fireproof construction is to be observed throughout. Exits from public buildings are not, by section 102, to be less than 1ft. wide for every seventy persons seated in the building, the minimum width of exit being 4ft. In Part 10 (special provisions for certain buildings) it is stated that dwelling-houses of one, two, and three rooms are not to contain less than 1,000, 1,600, and 2,400 cubic feet respectively. Every room on the basement and street floor (section 105) is to be at least 9ft. 6in. high from floor to ceiling, and every other room 9ft. high, except attics, which are to be at least 8ft. high. Every workroom is to be at least 11ft. high.

Part 12 deals with neglected structures, and Part 13 with scaffolding, barricades, sites for advertisements, &c. By section 133 (Part 14, procedure, expenses, notices, &c.) the Master of Works may test the strength of the materials being used at the expense of the owner. Part 15 deals with by-laws and penalties, and Part 16 with savings, &c.

In a schedule it is stipulated that the minimum thickness for external walls, if of stone or concrete, shall be 16in., 18in., 20in., and 24in. for one-, two-, three-, and four-storey buildings respectively; if of brick, 9in. for one-storey buildings, 14in. and 9in. for the first and second storeys respectively of two-storey buildings; 18in., 14in., and 14in. respectively for three-storey buildings; and 22in., 18in., 14in., and 14in. respectively for four-storey buildings. This applies to storeys not more than 14ft. high. Walls of newel stairs are to be not less than 4½in. thick, and those of hanging stairs not less than 9in. thick.

A MODEL CITY.

AN AMERICAN SCHEME.

THE interview with Mr. Ebenezer Howard, published in the BUILDERS' JOURNAL for October 25th, on the subject of his proposed "Garden City," and the correspondence to which that interview gave rise have attracted considerable attention, and have elicited some interesting information with regard to a somewhat similar project that has been set on foot on the other side of the Atlantic. By the courtesy of Mr. Howard we are enabled to publish the following letter which he has received from Mr. C. Herbert McClare, architect, of Cambridge, Mass.:—

"DEAR SIR,—I have read with much interest the several articles in the 'BUILDERS' JOURNAL' relating to your proposed 'Garden City,' and I wish to say that I think it a grand scheme, and hope you will be successful in having it carried out.

"There are a few minor points I hardly agree on, and think, with Mr. Strange, that a circular plan is not advisable, but I understand it is only a suggestion, and can be modified.

"For several years past I have given the matter of an ideal manufacturing community much serious thought, and some time ago secured a charter from the Parliament of Nova Scotia (of which country I am a native) for the purpose of building up agricultural and manufacturing industries in that part of Canada on lines similar to those proposed by you. I send you copies of the prospectus of the Co-Operative Company of N.S., which may interest you and give further suggestions in the direction of co-operation.

"Ours is quite a large undertaking for a people without great wealth, but you will note that it is planned in such a way that people of small means may participate in all the advantages of employers, and, at the same time, be employees. The main object of all this is to keep the people in the home country, and induce as many as possible of those who have emigrated to the U.S. to return and help develop the grand resources of their native land, and make that part of Canada one of the finest portions of the Empire of which we are all so proud.

"You will please note in the plan of 'Winchester,' shown in prospectus, that I have laid it out on the Meander River, which is to furnish the power for the various manufacturing enterprises, and that the various factories are grouped at either end of the town, which extends along the river. The wood-working mills and factories are at the upper end, and the textiles, &c., at the lower end. This plan will keep whatever dirt or noise there may be confined to these localities, and the building lots nearest the factories are reserved for the use of employees.

"You will also note that the public buildings, stores, shops, churches, schools, &c., are located in the centre of the town, with a grand approach over the bridge from the railway station.

"The street nearest the water on the town side is quite wide, and will form an esplanade, with buildings on one side only, and a pretty water park on the other side, the whole length from the lower to the upper mills—something over a mile.

"The main cross street (Victoria) is also very wide (120ft.) with provision for electric tramway. This street, after crossing the river on the bridge and esplanade, has the town hall on one corner and a large hotel on the other, with business buildings and offices next, and then the park or gardens with schools and public library, and the whole surrounded by fields and hedgerows, making, when completed, a very charming picture. Of course it is not so large a venture as you propose; probably the town will never contain more than 5,000 people, and if it is as successful as we anticipate we will plant another in some other part of the country—that will be an object lesson of what may be done by co-operative action. The beginning is slow, and much hard work is necessary for success. Hoping your plans may be successful, I remain, yours truly,

Cambridge, Mass., "C. H. McCLARE."
December 11th, 1899.

A perusal of the prospectus which accompanied the above letter shows that the American scheme differs in some important respects from that of the Garden City Association. In both schemes the aim is to establish a city where life may be lived under the happiest and healthiest conditions, and in both cases co-operation is the means by which this result is sought to be accomplished. But, whereas in Garden City the freest individualism would prevail, in Winchester, as the new city in Nova Scotia is to be called, affairs will be conducted on more strictly collectivist principles. The company which has the matter in hand proposes not only to acquire the land and build dwellings, but to build also schools, banks, hotels, churches, &c., to conduct mining operations, to run factories for the manufacture of boots and shoes, clothing, furniture, carriages, agricultural implements, &c., to carry on tinned provision works, a tannery and a publishing business, and generally, it would seem, to control the whole industry of the town. The capital of the company amounts to 250,000dols. which is divided into 5,000 fifty dollar shares. When a shareholder has paid into the treasury of the company a sum equal to 20 per cent. of the par value of the stock held by him, he is entitled to employment by the company, if he desires it. This, we take it, does not mean that only shareholders are to be employed; in the varied industries of the city, many of the poorer classes, as well as the comparatively well-to-do who become shareholders, would necessarily be employed. We do not see any provision made for workmen's dwellings, though there is a regulation that "tenement houses and other objectionable structures will not be permitted." The citizen of Winchester is encouraged to become a freeholder, but in "Garden City," it will be remembered, there is to be but one landlord—the municipality—Mr. Howard holding that a leaseholder in Garden City is better off than a freeholder elsewhere. These are points worth noting, in addition to those mentioned in Mr. McClare's letter.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

PRICE OF BRICKS.

NOTTINGHAM.—E. J. N. writes :—"Can you tell me the price of stock bricks in London for each year during the past ten years?"

The *average* price of stocks for each year was, per M of 1,200: 1889, 46s.; 1890, 46s.; 1891, 42s.; 1892, 42s.; 1893, 42s.; 1894, 43s.; 1895, 44s.; 1896, 45s.; 1897, 47s.; 1898, 47s. At the beginning of the present year, the price reached nearly to 51s. per M, but in the last six weeks the rate has considerably decreased.

R. W. C.

BOOKS ON QUANTITY SURVEYING.

WREXHAM.—"SUBSCRIBER" writes: "What do you consider the best books on quantity surveying, particularly those dealing with the law of liability as between proprietor, surveyor, and contractor?"

The best books are Leaning's "Quantity Surveying" (Spon); Davis's "Quantities and Quantity Taking" (Whittaker); "Specification" (published at these offices, price 5s.); and Stonhan's "Legal Position of Architects in relation to Certificates and Awards" (to be obtained from the Secretary, R.I.B.A., 9, Conduit Street, W., price 1s.). G. A. T. M.

DRAWING AN ELLIPSE.

LONDON.—STUDENT writes:—"If at an examination in geometry you were asked to draw *an* ellipse, would you be expected to draw a true ellipse, entailing a certain amount of freehand work, or would it be permissible to draw an approximate one by compasses?"

In an examination in practical geometry an ellipse must be drawn as a true ellipse—that is, by one of the methods giving intersections in points on the perimeter, these points being joined by a freehand curve. Compass curves are all circular, and cannot, therefore, be parts of an ellipse, which is a curve of constantly varying radius. HENRY ADAMS.

CLERKS OF WORKS' EXAMINATIONS.

PLYMOUTH.—E. B. writes: "Seeing in your valuable issue for December 13th that G. A. T. M. (in answer to 'W. C.,' Combe Martin) says there is only one examination for clerks of works, would you kindly let me know where it is held and by whom. Also, what are the subjects and age limits, as I notice it is stated that 'W. C.' has passed the age limit?"

LEEDS.—KING-POST writes: "Is there any recognised examination for clerks of works? If so, when and where is it held, and what is the age limit? What is the British Institute of Certified Carpenters?"

Examinations are held at varying intervals for clerks of works in H.M. Office of Works; but the conditions have been frequently altered, and we can only recommend our correspondents to apply for the most recent information to the Secretary, Civil Service Commissioners, 68, Victoria Street, S.W. Particulars of the British Institute of Certified Carpenters can be obtained from the Secretary of the Society, at Carpenters' Hall, Throgmorton Avenue, E.C. G. A. T. M.

CHOICE OF A PROFESSION.

LONDON STUDENT writes:—"I have been for the last year and a half in the office of one of the leading London architects, and am beginning to trace, &c., very well, and I attend the Polytechnic for building construction. I am not an articled pupil and have not the means to become one. I was wondering which would be the better to do—go and learn a trade or remain in the office. Do you think that if I remained in the office I should be able in a few years to obtain a situation as an improver, supposing I hold South Kensington certificates?"

It is very difficult to advise anyone as to his future career without a personal knowledge of the enquirer, as so much depends upon his aptitudes and even personal appearance. Architecture is not at present a close profession, and anyone having the ability can become an architect and practise as such without having been articled. South Kensington certificates are not thought much of by architects, because it is possible to obtain them through knowledge rather than through ability, two very different things. A prospective architect cannot do better than join the Architectural Association as a student and make full use of the advantages there given. If the enquirer has no artistic faculties, and has not already begun to scheme out designs and constructions, he will probably do better at the bench. HENRY ADAMS.

Correspondence.

ELLIPSE BY COMPASSES.

To the Editor of THE BUILDERS' JOURNAL.

ASHTON-UNDER-LYNE.

SIR,—In Mr Ramm's article in No. CCLII. of THE BUILDERS' JOURNAL it is claimed that the *true* form of the curve is obtained by his method. This statement so directly made, and so opposed to accepted theories and facts, at once challenges trial and criticism. Any draughtsman can, as I have done, easily prove for himself that Mr. Ramm's construction does not effect what he claims it to do. The actual result is simply an eight-centered curve somewhat resembling an ellipse, and that is all. As such, the construction is ingenious. Mr. Ramm, in his reply to Mr. Marsden (whose remarks I entirely endorse), dubs all older accepted methods as approximate, and he is, I think, not justified in doing so. The method of drawing the figure by finding points in the curve, using intersecting arcs and the two foci, is as correct and certain as the methods in use for any regular geometrical figure, not even excepting the simple square. The degree of accuracy is simply dependent on the ability of the draughtsman and not on the method at all; whereas Mr. Ramm's construction is wrong in principle, *i.e.* his curve suddenly alters in sweep or curvature at eight different points, whilst in the true ellipse the curvature is changing continuously from the flattest to the sharpest portions, and no portion of it can consequently coincide with an arc of a circle.—Yours truly

J. A. PERCIVAL.

To the Editor of THE BUILDERS' JOURNAL.

NEW CROSS, S.E.

SIR,—At first I thought I would not reply to Mr. Ramm's letter in your issue for December 20th, as it appeared to me that he was trying to shuffle off the demonstration, by which he could analytically prove the curve he described in your issue of December 6th to be a true ellipse. He said in that article that he would not give the analytical proof of his statement, and I think the reason is because he could not if he tried to. I am sure that many students of geometry would be only too eager to use Mr. Ramm's "Method of Drawing Ellipses" if a proof of its correctness was forthcoming; so once again I ask him to kindly give it.

I will allow that the result of drawing a curve by Mr. Ramm's method gives an exceeding good approximation to an ellipse, and that for most practical purposes it is an easy way to draw a curve approximating to the one usually drawn with the trammel, and it is a more useful method than the one usually used to set out a so-called semi-elliptic arch; this arch being in most cases more correctly described by the term, three-centred arch.—Yours truly, RUFUS E. MARSDEN.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"Seeing that engineering is distinctly an art of the present and future, and that both its materials and the principles and conditions of their employment are different from any which have hitherto been known; if it is ever to have any beauty of its own, or, to put it more hopefully, if its results are ever to be less objectionable than they are now, it must be by seeking for such results within the necessary conditions of its existence, and not by the addition or superposition of an utterly unsuitable style of ornament, drawn from past ages and a different order of things. In short, the exercise of ingenuity in works of pure utility must be made to occupy the place filled by decoration in ornamental design."
—SIR EDWARD J. POYNTER.

St. James's Court, Westminster. THESE buildings consist of residential flats, shops, and offices. The front elevation is carried out in Portland stone and Bracknel red bricks, and the elevations round the courtyard are in Flemish Renaissance freely treated. The three lower storeys are to be carried out in Messrs. Doulton's faience; above this will be a rubber brick frieze, to be carved with Shakesperian subjects. The entire construction of the walls, partitions, floors, and roofs is of fire-resisting material. Great care and attention has been given to the means of escape from the upper floors in case of fire, by providing balconies and iron staircases outside each block. The buildings are arranged round a central square courtyard, and in the centre building on the ground floor, approached by a main entrance from the front, are the public rooms, consisting of a salle-à-manger, restaurant, billiard-room, smoking room, and readingrooms. On the floors above the rooms are arranged in various sized suites, all approached by passenger lifts provided by Messrs. Waygood. The handsome wrought-iron gates to the courtyard have been supplied by Messrs. Starkie Gardner and Co. Electric lighting throughout will be by Mr. G. Vaughan Fowler, of Longbridge, Warwick; the stoves and chimney-pieces by Messrs. Ashton and Green, Messrs. Yates and Haywood, and Mr. John White, of Bedford; the plumbing and sanitary work by Messrs. Beaven and Sons, of London and Gloucester. Our illustrations (see inset sheet) are taken from drawings lent us by the architect, Mr. C. J. C. Pawley, of 25, Victoria Street, S.W.

A Newly-Found Roman Villa. A ROMAN villa has quite recently been discovered at Brislington, Bristol, in connection with the formation of a new road. On entering the field from the road the visitor will notice large heaps of ancient building *débris* thrown out by the excavators, consisting chiefly of stones of various sizes, of pennant grit, lias, and Dundry limestone, some of which have apparently come from the walls of the villa and the paved roads near it. In the sections of surface soil, layers of ancient mortar may also be seen, together with wood ashes, from which may be extracted fragments of the well-known common black ware which always accompanies Roman remains in this country. Near the centre of the field there is exposed a considerable portion of the tesselated pavement of the rooms of the villa; these are composed of small cubes of red tile and blue and white stone set in cement, and arranged in pleasing and intricate geometrical patterns, while lines of larger cubes of brown pennant grit form borders to the compartments, and appear to form the pavement of narrow passages between the rooms. There are probably hollow chambers beneath the floors for the passage of hot air with which the rooms were heated in winter time. Scattered around the pavements may be seen a large number of roofing tiles, formed of thick slabs of pennant grit carefully shaped, each with a nail hole in the corner for attachment to the roofing timbers, very similar in form to those in use in various parts of the country at the present time. There are also some large worked blocks of Bath or Dundry freestone, some of them channelled for water. The visitor will also notice one of the common flat Roman bricks, 11in. square and 1¼in. thick. From the presence of burnt roofing tiles, and discoloration on the white portions of the pavements, it may be assumed that the building was destroyed by fire, a fate common to the Roman villas in Britain. "The discovery of this villa," says Mr. F. Ellis, of Bishopston, "is an additional proof of the fact that over the whole of our district in the Roman period there were scattered habitations in little clearings in the forest, in touch with each other by roads wide enough for the passage of ox wagons, and leading by wider paved highways to the great Roman centre at Bath."

A Vile Street.

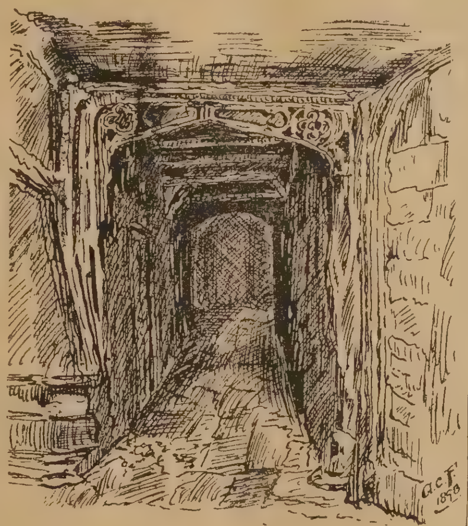
THERE are some spots in every city which seem to attract the dregs of the population, exhibiting in a ghastly manner all that is squalid and brutal in the life of a community. New York has its Allen Street—a short, dark, ugly thoroughfare, only eight blocks long, entirely under cover, and screened by "the hideous structure of the elevated road." It looks like a dog kennel, into which human beasts may creep and shelter themselves when hunted and driven to earth. Here they may make their final stand, and perish in the last ditch of vice and crime. What is most remarkable about Allen Street is that it is literally fenced in and hedged about by the very institutions that are supposed to be redeeming the world—the public schools and the reform associations. But these institutions seem to have no effect on the viciousness of the place. The Society for Ethical Culture has devoted itself to the legal aspects of the problem, and is now trying to see if the law does not offer some relief to the terrible conditions. It were well for any city to have such a plague spot wiped out.

The Chinese Exhibit.

IT is proposed to make the Chinese section of the Paris Exhibition specially attractive. The arrangements are under the control of Sir Robert Hart and the Maritime Customs, there being only one private exhibitor, a well-known curio dealer from Pekin. An officer of the Customs, M. Vapereau, has been in Paris for some months past getting the section into order. The position is not a central one, for it is in the gardens near the end of the eastern wing of the Trocadéro, but the slope of ground and the large trees afford an opportunity for effect, and the view across the river from beneath the trees to the Eiffel Tower, will make the place a favourite resort during hot weather. There will be a four-storeyed pavilion, 60ft. high, covering about 400 square yards, with a lake in front. One of the floors of the pavilion will contain a Chinese theatre and restaurant, while the exhibits will take up two of the floors. There will be three smaller pavilions, and a row of Chinese shops with men at work. The Siberian section comes next to the Chinese, between them being a Siberian railway train with a model of the Pekin terminus at one end and that of Moscow at the other, while a moving panorama of Siberian and Manchurian scenery along the line will complete the illusion.

London and Paris.

THERE is one thing in Mr. Charles Whibley's article in "Macmillan's Magazine" on the streets of London and Paris with which we cannot agree. He says that the first impression one gets of our capital is that of silence. "No cobbles persuade the cart-wheels to a restless rattle; the tyres of the cabs roll tranquilly over wood or asphalte; the foot-passengers hustle by in business-like quietude, or they greet one another without gesture and without effusion. In Paris, all is movement, bustle, and joyousness; nobody is in a hurry, yet everybody flashes his hands and his tongue at the same rate. The one city is silent with haste, the other is noisy with a nonchalant leisure." Though no one could dispute the reflex in the individual of the national characteristics of the two countries, we cannot carry this to such an extent that it makes the capital of the silent Britisher silent itself; is not the reverse very much more the fact? All harmony-loving citizens will agree with what Mr. Whibley says of the illuminated night sign, which still remains objectionably prominent despite all the attacks that have been made with the view to its abolition. They wink, they shift, they scintilate, they go out. Now yellow plays on red; now darkness pockets all the colours, and the passer-by is not only distressed by these sudden apparitions, he is even prompted to the cultivation of a new vice. As his cab rushes by the illuminated spot he will hazard all the money in one pocket against all the money in another that the red light will not flash again until he is swept off out of sight." A return to London is, in our author's opinion, a return to sombre walls and ugly hoardings, which makes the regret for Paris all the sharper. Nor is it only on her walls that London exhibits her dinginess. She is duskier than of yore, and the houses are growing loftier and are casting longer shadows. The passion for flats, combined with the greed of landlords, is more resolutely excluding the sun from our streets. London ought always to remain a city of low houses. The tall flats of London, then, exclude the sun, and, being built of materials which absorb rather than reflect the light, increase the gloom of city and suburb alike. But the folly of councils and architects cannot abolish the immemorial grandeur of our capital. While Paris is touched with the finger of beauty, London preserves intact her ancient character.



ENTRANCE TO NO. 3 COURT, NORTH STREET, TAUNTON, SOMERSET. SKETCHED BY ALBERT C. FREEMAN.

A Picturesque Slum.

ON this page we illustrate the entrance to some slums off North Street, Taunton. It is built of wood, and is fast decaying as will be seen. The carved and cut head of the doorway is of very good workmanship. As far as can be gathered it is the remains of an old building. The drawing is by Mr. Albert C. Freeman, of Clapham, S.W.

Bell-Hanging Extraordinary.

ONE does not expect to find a church bell up a tree, yet there is one in the parish of Therfield, Herts., which occupies this unique position. More than twenty years ago the church was rebuilt, and altogether, including the rebuilding of the chancel, for which the rector was responsible, a sum of £5,487 was spent on the work. There were not, however, sufficient funds to complete the rebuilding, and the upper portions of the tower and church remain unfinished to the present time, about £1,000 being required for completion. As there was no belfry in which to place the bells, one was hung on the branch of a large walnut-tree in the Rectory Close, adjoining the churchyard.

More Fire Tests with Glass.

WE have already given accounts of glass tests made by the British Fire Prevention Committee; those most lately conducted have been with three casements, one glazed with ¼in. plate glass, one with 32oz. sheet glass, and one with lead lights. Within 6 minutes the flame burst through the 32oz. sheet glass casement, and the whole had fallen within 12½ minutes. The lead glazing collapsed after 7 minutes, and within 12 minutes the flames passed through the ¼in. plate glass: within 14 minutes the latter had fallen. The idea was to record the effect of a thirty minutes' fire test, but, as shown, all the casements had collapsed within half that time, and water was therefore not applied, as had been originally intended. From the foregoing it will be seen that the casements glazed with plate glass withstood the fire longest.

President Kruger's House.

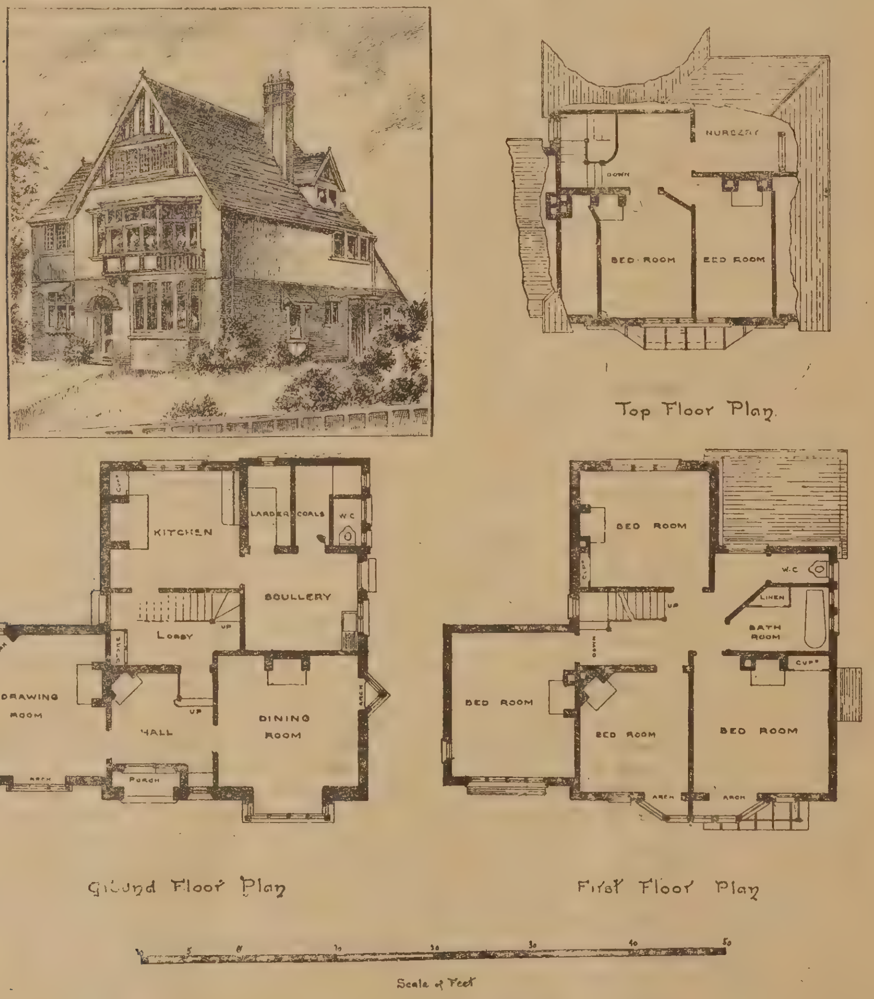
PRESIDENT KRUGER'S house at Pretoria is the usual bungalowed building, with the hideous zinc roof which one sees throughout South Africa; and, though doubtless comfortable, it cannot be termed beautiful. The Stoep, where Oom Paul is said to conduct so many interviews, runs straight along the front of the house, and there is the inevitable flight of shallow steps, widening in a generous outward sweep as they reach the ground, which one may see in nine houses out of ten at the Cape. Below the steps, on each side of the entrance, are the stone lions which Barney Barnato presented to the President—one hopes with no intention of sarcasm, but the effect of Paul Kruger's house guarded by a possibly British lion is inevitably suggestive. These handsome stone beasts are the only unusual addition by which to distinguish the Presidency from a score of other buildings like it. The scaffolding still remains surrounding the pedestal on which the President's statue is to be placed. On October 10th (President's birthday, a public holiday), according to previous arrangements, the statue was to be placed in position and uncovered, with due solemnity, in Presidential presence. Needless to say, this function has not been carried out yet.

Carthage.

THE ancient citadel of Carthage, on Byrsa Hill, was not identified till the beginning of the present century. "Travel" says that since then numerous excavations have revealed vestiges of the old cisterns, amphitheatre, temples, baths, and palaces, Phœnician tombs many feet below the surface, curious mummified remains and rich funeral ornaments, and Roman sepulchres of later date containing urns filled with ashes. Recent research during the past few months by a French antiquarian society has revealed the remains of the old heathen sanctuary dedicated to Jupiter Ammon. It is situated in the most important region of Carthage, and the cutting made exhibits several successive steps in civilisation. Just below the soil fragments of lamps, mosaic, coins, and pottery, were found, and still lower Byzantine tombs, on one of which appears a very common Christian epitaph, "Fidelis in pace." Below these is a Roman dwelling containing a beautiful white marble colossal head of Marcus Aurelius. A cistern in the middle of the habitation gives evidence of having been supplied by some great public reservoir. South of these are two rectangular rooms paved with mosaic, and in wonderful preservation considering the lapse of time. On removing the mosaics a staircase was discovered leading to a hall which had evidently been elaborately decorated. Here have been found Christian lamps bearing the impression of fish, of palm trees, and of the Cross, and also mutilated marble statuettes of Pagan divinities and the crowned mask of a goddess. At the end of the hall is a large marble slab bearing the inscription to Jupiter Ammon, and dedicated by twelve priests and a woman, who seems to have held the position of chief priestess. Near by were found four statues, rather more than 3ft. in height, almost intact, and finely chiselled in white marble. More interesting to many archæologists even than this heathen temple are the Punic tombs many feet underground, in which have been found wine jars, grain, rings and necklaces, and coins dating back to more than 1,000 years before Christ.

Professional Practice.

Aberdeen.—The new administrative block which has been added to the City Hospital is from designs by Mr. John Rust, the city architect; it has cost £5,000. The principal feature of the front elevation is a central clock tower rising to a height of 57ft. The block is 100ft. square. On the ground floor there are reception and departure wards, with bath rooms between each for the use of patients entering and leaving the hospital. There are also eight bedrooms for the use of nurses, a number of whom formerly had to be accommodated outside the building. On the first floor there are eighteen bedrooms for the accommodation of nurses, wardmaids, and laundrymaids. A dining room, 20ft. by 14ft., has been provided in the new block on the ground floor, and in the old block adjacent a nurses' sitting room has been formed by converting two bedrooms into one large room. All the latest sanitary appliances have been used in connection with the construction of the block, which is heated by steam pipes and radiators.



Top Floor Plan.

Ground Floor Plan

First Floor Plan

HOUSE AT UNDERHILL PARK, REIGATE. C. E. SALMON, ARCHITECT.

Dundee.—A new church has been built by the Park United Presbyterian congregation at the corner of Park Avenue and Morgan Street from the designs of Mr. Leslie Ower, F.R.I.B.A., at a cost of £3,200. The elevation to each street consists of a gable having three heavy butresses and two double-light traceried windows. The main entrance is under the tower, which is 87ft. high to the top of the finial. The style of architecture is Early English, and the building is of blue Forfarshire stone, the hewn work being angle scabbled and the rubble dabbed. The interior is octagonal on plan with concentric seating, and the floor is sloped towards the pulpit, which is set on a large choir platform in a recess surmounted by an arch; in the gable above there is a large, richly-coloured wheel window with tracery. The roof and ceiling are entirely of wood, the couples being of massive timbers with moulded hammer beams and heavy drop ornaments. There is a vestry, ladies' room, engine room, and lavatories at the back, and the heating chamber is underneath the church. The heating is by small-bore pipes, and boxed-in coils are placed in the window breasts, with fresh air inlets to insure a supply of fresh warm air without draughts. The windows are filled with leaded cathedral glass in delicate tints, and the seats are of pitch pine stained a greenish colour and varnished. The walls in the upper parts of the four gables are a primrose colour, and a deep bold stencil band runs across each gable at the level of the wooden cornice. The colour on the main body of the walls above the gallery is a rich salmon shade, lined out in bands, while under the gallery the shade is chocolate. The pulpit gable is richly treated in stencil work, and in the pulpit recess the colour is a fine shade of dark red with gold stencil ornament. The windows are treated in a grey colour, with stencil bands in shades all round. The church is seated for 680 persons. Mr. William Bennet was the contractor for the mason work.

London.—There has been erected in the Aldersgate Garden, by Mr. G. F. Watts, R.A., a memorial "cloister," on the wall of which he proposes to record the heroic deeds performed from time to time by ordinary people in the ordinary walks of life. It consists of a red-tiled roof sloping down from the wall to a height of 7ft. from the ground, and supported by seven pillars. The floor is about 7ft. wide, and is also tiled red. The distance covered is rather more than 50ft., and a seat of this length will stretch along the lower extremity of the wall. Above the sloping back of the seat the space is divided into six portions by piers formed of brown glazed bricks. Each portion is divided horizontally into six sections, and it is in these spaces that the memorials will be inserted, probably in the shape of marble tablets.

Perth.—New premises for the Royal Bank of Scotland are in course of erection at the north-west corner of the High Street and New Kinnoull Street, almost opposite the Post Office. It has a frontage to High Street of 53ft., and towards Kinnoull Street of 120ft. The bank premises are to be in the corner on the ground floor, and consist of a telling room, 34ft. by 28ft.; agent's room, 16ft. by 15ft.; and fireproof safes, lavatory, and other conveniences. The remainder of the block on the ground floor in Kinnoull Street is to consist of three large double shops, with saloons behind if required. The building is four storeys in height. The upper storeys are in the meantime being arranged as a suite of solicitors' offices; but they are being so constructed that they can be converted into dwelling-houses if found necessary. The design is in the classic style. The ground floor of the bank has arched windows and an angular doorpiece with granite columns and arched pediments. The shop fronts are lofty, and will be finished in a modern style with teak wood. The first floor windows have Corinthian pilasters and pediments over them. The corner building is to have a cantilever cornice, with balustrade and pedimented attic windows, surmounted by a high mansard roof; and the whole building is to be provided with fireproof floors. Mr. David Smart, of Perth, has prepared the plans.

Reigate.—The house which we illustrate on this page has been erected upon undulating ground at the foot of the North Downs, near Reigate, and commands extensive views—south over the Weald, and west to Leith Hill and the fine bold curves of the Chalk Downs to Guildford. The lower portions of the house (and chimneys) are of local red brick, with cavity. Above the moulded brick string-course the walls are rough-cast and finished with small ballast, sand, and lime well mixed together, and slightly tinted with ochre. Portions are broken up with solid half-timber work, left rough from the saw, pegged together, and dressed with Stockholm tar. The tiles are red, sand-faced, and of Ashford manufacture, which weather quickly to a pleasing tone. The builders were Messrs. W. Bagaley and Sons, of Mead Vale, Redhill, and the architect is Mr. C. E. Salmon, of Bell Street, Reigate.

Holywell Street Demolition.—£40,000 was the amount of compensation in respect of the freehold interest in the Opera Comique Theatre, which Mr. Troutbeck and a special jury settled at the hearing of the case of Fowler's Trustees v. The London County Council. Claim was made for £60,000.

A New West-End Mansion.—The Duke of Marlborough is to revive the ancient glories of that illustrious dukedom by building a town house. The architects have already been selected and the site provided. This is to be on the ground occupied by Curzon Chapel, on the south side of Curzon Street, and between Chapel Street and Market Street. The elaborately carved oak pulpit has been presented to the parish church of Penn, in Buckinghamshire.

Views and Reviews.

QUANTITIES AND QUANTITY TAKING.

AN elementary work on quantity surveying suitable for the absolute beginner and dealing with the subject upon other than antiquated methods, has long been needed, and Mr. Davis appears to us to have met the requirements well. He is careful, while adhering to one system, to point out that several systems are in use even in London, and, as London practice must, presumably, eventually dominate the whole country, he is, perhaps, wise in making no reference to much more divergent systems of local application only, admirable though some of these undoubtedly are. Every surveyor will contend that his own is the best system. As to himself it probably is, but no two are likely to agree upon all points. A system, however, of "taking-off" which has much to recommend it, and which Mr. Davis does not mention, is that of dealing, firstly, with the items which lie flat upon the plan, such as surface excavating, floors, ceilings and roofs; then, with those standing vertically, including the walls with their excavation, foundations, damp courses, facings, openings, and the joiner's work connected with these, such as doors and windows; and, lastly, taking off the finishings. A very good point in the book is the insistence upon exactitude, for it is clearly wrong that quantities should be taken either "full" or "short," allowances for this or that labour omitted being but poor substitutes for correct dimensions and full descriptions. Another point, equally good, is the recommendation of references, such as allow every item to be subsequently identified if needed. The one weakness of the book lies in the examples of "taking-off" and "abstracting" given at the end having been set up in type instead of being photo-reductions of sheets used in practice; the result is that the crossing-off and ticking of the collections and of the transferences have not been shown. They are mentioned certainly, but the beginner requires to be shown such things, which are of the first importance, very clearly indeed. For these purposes, too, a greater use of variously coloured inks than there has been any mention of can often be made advantageously. A.

"Quantities and Quantity Taking." By W. E. Davis, surveyor. London: D. Fourdrinier, "The Builder" Office, 46, Catherine Street, W.C. Price, 3s. 6d., post free.

TWO ART MAGAZINE VOLUMES.

It is unnecessary for us to speak at length of the "Studio," this most popular of the monthly magazines, which deal with miscellaneous artistic matters. It shows no sign of falling off from the standard of general excellence it has long maintained. In looking through this volume we are particularly struck with the quantity given for the small price charged each month—several coloured plates being generally given in each number. Architecture is not overlooked, articles being included on Mr. Ernest Newton's designs for country and suburban houses and on Mr. Mortimer Menpes' experiment in the application of Japanese ornament to the decoration of his own house. Other articles of particular interest to architects are:—"The Work of Reynolds-Stephens," "Decorations for a Music Room," "A Modern Bath Room," and "William de Morgan and his Pottery." The illustrations are very well reproduced and printed on paper very suitable for the purpose; the plates in colour by the half-tone process are amongst the most successful we have seen.

The volume of the "Magazine of Art" forms a most sumptuous record of the year's progress in Art. As usual it is printed and illustrated in the best manner. The articles upon rising and risen artists form a prominent feature as formerly, and the section entitled "The Art Movement" contains a good deal of useful information and interesting descriptions of work of which we do not find a record elsewhere. The "Chronicle of Art" gives information which will have historical value in a few years. The reproductions in colours by the half-tone process are in most cases very successful. Mr. Halsey Ricardo contributes a most interesting and instructive article on the designing of town houses. We wish Mr. Ricardo's hints were more attended to by the clients, who, as he points out, will profess a knowledge of architectural matters of which they are entirely ignorant; it is not so much the fault of the architect that so much bad work is produced as the cheese-paring economy of their patrons. Mr. Starkie Gardner's article on the revival of handicraft in lead-working is useful and interesting to architects.

"The Studio." Volumn XVII. London: The Offices of "The Studio," 5, Henrietta Street, Covent Garden, W.C.

"The Magazine of Art," 1899. London: Cassell and Co., Ltd., La Belle Sauvage, Ludgate Hill, E.C.

BYZANTINE CONSTANTINOPLE.

Byzantine history, though little studied, is always fascinating, and Byzantine architecture, which has, perhaps, been even less studied, is equally interesting; while both do much to bridge over the gulf between the classical and modern epochs. We, therefore, welcome this new contribution of Mr. Van Millingen's, which treats, in a measure, of both subjects, and contains much hitherto neglected material. At the same time, the leading title of the book is rather misleading, for, as the sub-title indicates, it is only a portion of the Byzantine remains that is here described, while the historical side of the book is limited to those events which can be connected with the walls and their immediate vicinity. In short, one is led to expect a general treatise on mediæval Constantinople, which it proves not to be; but we trust that, as a hint in the preface seems to imply, this is only a first volume, and that it will be followed by others dealing with the churches and the general topography of the city.

The author's general aim has been to identify the historical sites with the view of making the events more intelligible and vivid. His work claims to be in the main a fresh and independent investigation, with constant appeals to the original authorities, and he has personally examined with the greatest care all the localities concerned. As a Professor of History in Robert College, he has the advantage of living on the spot, and deriving therefrom all the aid that the *genius loci* can afford.

After two introductory chapters dealing with the geographical limits of the ancient city, and the arrangement of the present one, we are personally conducted (so to speak) round the walls in order, ending up with the shores of the Golden Horn and the Sea of Marmora. There is an excellent key-map of Byzantine Constantinople, which, for the average reader, obviates pages of description; and more valuable, though less interesting to study by itself, is an elaborate map on one plate, giving the whole extent of the land walls built by Theodosius, by means of which the author's course may be more easily followed.

Roughly speaking, there are three walls encircling the city, the first enclosing the ancient Byzantium on the end of the promontory; next, the wall of Constantine to the north-west, increasing the area of the city to five or six times its original size; and, finally, the Theodosian walls, stretching almost in a straight line for more than three miles from north-east to south-west, and almost doubling again the area of the city. To judge by the photograph facing p. 46 they must be most imposing in character, with their battlemented towers at frequent intervals, and their stupendous masonry.

Mr. Van Millingen has evidently read up his historical authorities, dreary chroniclers as some of them no doubt are, with great care and diligence, and he has chapter and verse for every statement. He points out, however, that many questions cannot be definitely settled until excavations are permitted. His handsome and erudite volume should be carefully studied by all interested in the subject.

H. B. W.

"Byzantine Constantinople: the Walls of the City and Adjoining Historical Sites." By Alexander Van Millingen, M.A. London: John Murray. 1899, Price 21s.

New Patents.

These patents are open to opposition until February 6th.

1898.—Artificial Marble and Granite.—25,155. T. W. JAMES, Smethwick, Staffs. For statuary or white marble, 65lbs. of calcined chalk, 6lbs. of mica dust, 4lbs. of ground borax, and 5lbs. of soluble silicate are mixed with hot water and run into moulds. When half dry, the surface is impressed with imitation veins, which are afterwards filled with oxide of manganese and slag. The surface is then worked off smooth. The invention also includes recipes for making imitation black-veined or Bardilla, green or Kilkenny, and Devonshire red marbles, and Aberdeen and Portland granites.

Skirting Heaters.—25,335. T. SCOTLAND, Glasgow. Instead of employing pipes, either bare or covered, the skirting itself forms the conducting medium. It may be of cast-iron or other metal, either in one piece or in several pieces, and is divided into two or more compartments. It is claimed to be much neater and cleanlier than ordinary heating pipes.

1899.—Lock and Pulley Casings.—1,828. S. and J. WILKES and W. J. GOODMAN; all of Bloxwich. A metal blank having a somewhat cross-shaped form is taken and bent up into the shape of the letter U. The bottom portion is them stamped flat, different portions are turned over, and perforations are made; the result being a lock or pulley case made entirely out of one piece of wrought metal. The idea is to greatly cheapen the cost of manufacture.

Hollow Bricks.—2,128. B. ROBINSON, Church Greseley, Derbyshire. The object is to make a glazed brick or tile as light as possible, and to dispense with the ordinary method of pressing. The machine is like an ordinary sanitary pipe machine, the clay being fed downwards through a die. On the die plate are a number of half moulds, and fitting on these are depending pieces fixed to a cross bar. When the mould has been filled and operated a brick is produced which is hollow and has internal strengthening ribs. It is very light and requires less heat for burning than an ordinary brick.

Scaffoldings.—16,266. H. Göttsch and C. Fehrs; both of Germany. The stage consists of two metal end frames connected by top battens and a flooring. It is suspended by tackle from pulleys working on a beam at the top of the building, and in the flooring is a hole fitted with a trap-door. Through this a bucket can pass when required, the sides of the hole being fitted with rollers to prevent the rope chafing. Rollers are also provided on the stage to run against the face of the wall.

Chimney Cowls.—19,973. W. WHITEHEAD, T. HARRIS, and H. C. SACRE; all of Manchester. Fixed to the top of the chimney pot is a tube having a crossbar, bent upwards, at the top. To this crossbar is attached the oil-cup, which contains the fork that supports the hood. This is shaped like a short cone and has an universal joint, so that it will tilt with the wind and cover the chimney mouth, so preventing downdraught. A spiral ventilator is combined with a hood in a modification of the invention.

Pencil Attachments.—21,641. G. D. RODDA, London, N.W. Removably fixed on the top of the pencil is a metal cap having pricking points, these being protected, when not required, by a cover. Any number of points can be used, according to scales, and several methods are mentioned for attaching them to the head.

Pipe Cleaners.—21,683. A. J. BOULT, London, E.C. (*F. Navotny and O. Mierisch; both of Germany*). A solid oval-shaped body with a smooth surface, a similarly-shaped body having cutting knives and a brush—these are connected with links one behind the other and driven through the pipe by compressed air, steam, or water. The first acts as a piston, the second cuts up the deposit on the pipe, and the third brushes it off. It is said that cleansing with this apparatus is very rapid and efficacious.

The following specifications were published on Saturday last, and are open to opposition until February 13th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898. — 26,375, Maës, apparatus for checking workmen's times. 26,600, Smith and Scruton, endless block tackle for raising, lowering, and hauling heavy weights, driving cycles, machinery, and for all other like mechanical purposes. 26,732, Purvis and Purvis, apparatus for manipulating metal baths or other articles inside and outside furnaces during the process of enamelling. 27,049, Shurmer, wood working machine, the same being also applicable for use in the cutting and shaping of metal. 27,329, Monplot, public lighting apparatus. 27,509, Himes, nut locks.

1899.—Holman, means for securing the lids of gas retorts, applicable also for securing other lids, flaps, doors, and the like. 477, Brockelbank, fastenings. 741, Hellyer, under - water - line water closet. 1,487, Davidson, electric light wire casing. 1742, Heaton and Dugard, manufacture of casements and their parts. 2015, Cranstone and Archer, hydraulic lifts. 2140, Cree, apparatus for bolting or locking waggon or other doors or gates. 2714, Edge and Mangnall, instrument for ascertaining or indicating the shape of the wearing surface of tram rails or other surfaces subject to wear or being operated upon. 2731, Warwick, structures for playing grounds and pleasure resorts. 2742, Bowles, electric floats for theatrical purposes. 2769, Hellyer, water closets, slop sinks, and the like. 2848, Smith, manufacture of varnish. 2924, Beard, tell tales or checking devices for watchmen, workmen, servants, and the like. 3066, Shanks, waste or discharge valve of sinks, washing vessels, baths, lavatories, and the like. 3210, Curtin, plug or wedge for fixing flashing of buildings and other structures. 3350, Lockley, latches. 15,014, Cox, interlocking roofing tile. 16,050, von Porell, process for the production of Portland cement from blast furnace slag and lime and the like. 18,587, Offenbacher, process of manufacturing decorated glass, glass lenses, hollow-ware tubes and other articles, and machinery therefor. 19,658, Boyd, hot closet fitted to a domestic fireplace (for burning coal and other fuel) for cooking or for keeping plates, food, and the like warm. 19,660, Boyd, open fire stove for burning anthracite or other smokeless fuel. 20,035, Donnelly, screening apparatus. 20,099, Powers, means of automatically supplying water to fire hoses. 20,283, Bachmann and Caracristi, air-heating furnace for drying casting boxes or moulds. 20,416, Hindmarsh, drain gratings and the like. 20,796, Barnes, window sashes, shutters, and the like. 20,801, Wise (*Empire Engine and Motor Co.*), hoists. 21,230, Bailey and Stevens, pipe couplings. 21,752, McCartea and Lester, nut locks. 21,814, Lebioda, process for preserving wood. 21,921, Hutton. carbonising and obtaining of products from precipitated sewage sludge.

A Memorial Window at St. Martin's Church, Leicester, has been unveiled in the Military Chapel. It is by Messrs. Clayton and Bell, of London, and is in memory of the late Colonel Reader.

Mr. John Spink, of Sheffield, has lately died. He was secretary of the Sheffield Master Builders' Asssociation and president of the Yorkshire Federation of Building Trade Employers, and was actively engaged in the lengthy dispute which terminated in July last.

At Canterbury Cathedral it has been discovered that the recess in the north ambulatory of the presbytery in which the chained Bible lies was the site where in pre-Reformation times the Easter sepulchre was deposited during Holy Week. The alteration was doubtless the work of Archbishop Cranmer.

Keystones.

Professor Maspero has been appointed to the Directorship of Antiquities in Cairo.

An Architectural Library is to be formed in connection with the Three Towns Architectural Society.

The Great Yarmouth Master Builders' Association recently held its second annual dinner, when the Mayor (Mr. B. H. Press) presided.

Mr. G. F. Watts, R.A., who is now at Limnerslease, near Guildford, is nearing his eighty-fourth year. He has been in somewha uncertain health lately.

Mr. H. P. Fletcher, the son of the late Professor Banister Fletcher, C.C., J.P., has been elected a vice-president of the British Institute of Certified Carpenters.

An annual Rosa Bonheur Prize of £60, to be awarded to the most meritorious work at the French Salon, is to be founded through the generosity of Mlle. Anna Klumpke, the deceased artist's friend.

The English Church of St. John the Baptist at San Remo was destroyed by fire on December 26th. It is supposed that the fire was caused by a defect in the heating apparatus. The insurance amounts to £6,000.

Stepney Parish Church.—The total sum spent on the restoration and redecoration of St. Dunstan's is £5,000. Towards this sums amounting to £4,750 have been received or promised, leaving only £250 to be collected.

A Memorial to Alphand the Architect, by M. Dalou, has been unveiled in Paris. It is not so important as Dalou's work "The Triumph of the Republic," but it is very realistic and is treated with great technical decision.

The Glasgow School of Art is now housed in a new building at the corner of Renfrew Street and Dalhousie Street; the school was started about 140 years ago by the brothers Foulis. Messrs. Honeyman and Keppie are the architects for the new building.

Messrs. Elliston and Carell's Premises in Magdalen Street, Oxford, are being rearranged and enlarged at a cost of over £10,000, and, when completed, will be the finest shop in the city. Mr. Herbert Quinton, of 22, George Street, Oxford, is the architect.

Workmen's Dwellings at Edmonton.—On the ground that it would involve them in an expenditure of £100,000 for the erection of workmen's dwellings, the Edmonton District Council have declined the offer made by Sir Samuel Montagu, Bart., M.P., of twenty-five acres of land in the parish.

Baths at Dunfermline.—In 1877 Mr. Andrew Carnegie presented baths to the burgh of Dunfermline (his native town) at a cost of £5,000, and since the opening Mr. Carnegie has spent about £2,000 on reconstruction work. He now expresses his desire to spend £20,000 more on baths and a gymnasium.

Labourers' Cottages for County Wicklow.—A Local Government Board inquiry has been held into the three schemes formulated by the Rural District Councils of Baltinglass under the Labourers' (Ireland) Acts for the purpose of providing a large number of new cottages (as well as acquiring existing cottages) and to provide half-acre allotments to them.

The Capuchin Monastery at Amalfi.—The Capuchin Monastery at Amalfi, which was lately destroyed by a landslip, was of great historical interest. Built for the Cistercians early in the thirteenth century, it contained some remarkably fine cloisters and arcades. Having fallen into ruin through a landslip in 1498, it remained uninhabited until 1583, when it was handed over to the Capuchin friars, who retained it until 1869, when the present Government converted it into a normal school. The monastery has often been made the subject of well-known pictures, which show what superb views were commanded from the beautiful Gothic ambulatory of Amalfi and the neighbouring coast.

Book Plates are a spreading fashion.

A Refuse Destructor is proposed to be erected at Brighouse.

A new Pulpit at Wyke Parish Church was dedicated on Saturday last.

Mr. James Deas, C.E., resident engineer to the Clyde Trust, died on December 29th.

A destructive fire at Salem Congregational Chapel, York, broke out last week. It is supposed to have been caused by an overheated flue.

The Gas Trades' Exhibition is now in full swing at the Royal Aquarium, Westminster, S.W.; it remains open until January 23rd. About fifty firms exhibit.

Windsor Weir.—The central portion of the footbridge at Windsor Weir suddenly collapsed on Saturday, owing to the failure of some of the supporting woodwork.

The Church of the Holy Cross, Cardiff, was destroyed by fire last week, the outbreak being attributed to the heating apparatus. The damage amounts to £2,000.

Searchlights for the New York fire brigades are to be provided, to assist them in their work. They will consist of two 18in. lenses and electric light plant carried on a small waggon.

Drury Lane Theatre.—The production of the pantomine this year has been facilitated by the extensive new paint room, ballet room, carpenters' shop, and wardrobe rooms, recently erected at the east end from designs by Mr. Philip E. Pilditch.

New Workhouse at Hunslet, Leeds.—The Local Government Board have approved the plans for the proposed new workhouse at Hunslet, with the exception of the block for imbeciles and epileptics. The total cost is estimated at £61,000.

Glasgow Exhibition Chairmanship.—The difficulty in regard to the chairmanship of the Executive Committee of the Glasgow Exhibition has been solved by the resignation of Sir David Richmond and the appointment of Lord Provost Chrisholm.

Art Exhibition in Paisley.—The twenty-fourth annual exhibition of the Paisley Art Institute was opened last week. The exhibits number 324. As usual, a prominent feature is made of loan works, which this year include works by Sir John Millais, Sir John Gilbert, Ettz, Sam Bough, Sir Nathaniel Dance, and Orchardson.

The Holy Well in Holywell Street.—Messrs. Anley and Son, builders, Dalston Lane, N.E., writing to the "Daily News," state that when making some alterations to one of the houses in Holywell Street in 1877 they found a beautiful well 7ft. underground, the water in which was very clear and good. They covered it with stone slabs and concreted over.

Big Building Scheme at Batley.—The Batley Corporation last week passed plans for the erection by the local Co-operative Society of eighty-eight working-men's dwellings on a site on the Bradford Road. The scheme will entail an outlay of over £20,000. The dwellings, when built, will be sold to the members of the society on the easy payment system.

Large New Buildings at Newcastle-on-Tyne.—It is proposed to erect a building containing shops and offices next to the National Provincial Bank at the top of Dean Street; a high block of buildings on the old Milk Market site, Quayside, for the Co-operative Wholesale Society; and a large warehouse for Messrs. Spillers and Bakers, Limited, opposite their steam mills in the Close.

King's College Classes.—The Carpenters' Company, in conjunction with the Council of King's College, announce in another column the reopening of their evening classes next week at King's College. It has been found necessary to rearrange the classes somewhat, in order to admit those students who were unable to join last term owing to the classes being full. Even with the changes made, it will be advisable for intending students to apply early, as there are not a large number of vacancies.

New Companies.

Leeds Contract Company, Limited.

This company was registered on December 7th by the Solicitors' Law Stationery Society, Limited, 12, New Court, W.C., with a capital of £10,000 in £1 shares, to carry on all kinds of promotion business; to construct and maintain, or assist in the construction and maintenance of public and private works, and to carry on the business of contractors, engineers, carriers, shipowners, &c. The first directors (to number not less than two nor more than five) are J. W. Close, G. Dove, S. W. Meyer and E. Sisterson (all permanent).

Northampton Estates and Improvement Corporation, Limited.

This company was registered on December 12th by Hutchinson and Cuff, 47, Chancery Lane, W.C., with a capital of £20,000 in £1 shares, to adopt an agreement with S. S. Campion for the acquisition of certain land and property, and to carry on the business of builders, architects, surveyors, &c. The first directors (to number not less than three nor more than seven) are G. Bruford S. S. Campion, J.P., W. S. Cuff, G. Ellard and Major F. Sheffield. Qualification, 200 shares. Remuneration, £35 each per annum (£10 extra for the chairman) and a share in the profits. Registered office: 7, St. Mildred's Court, E.C.

J. and H. Smith, Limited.

This company was registered on December 13th by Lawrence, Graham and Co., 6, New Square, Lincoln's Inn, W.C., with a capital of £30,000 in 3,000 £5 preference shares and £15,000 £1 ordinary shares, to acquire and carry on the business of furnishing, builders', artistic and general ironmongers, locksmiths, &c., carried on at 11-12, New Briggate, at 7, Mark Lane and at Belgrave Ironworks, all in Leeds, under the style or firm of J. and H. Smith, and to adopt an agreement with H. Smith. H. Smith is the governing director, with £300 per annum, and may retain office so long as he holds £2,000 shares. The other first directors are J. E. Smith, R. P. Smith, W. H. Smith and T. Hannam. Registered office: 11, New Briggate, Leeds.

Cunliffe's Kettering Brickworks, Ltd.

This company was registered on December 14th by Witherby and Co., Newman's Court, Cornhill, E.C., with a capital of £15,000 in £10 shares, to acquire and carry on the business now carried on by W. Cunliffe at the Northfield Steam Brickworks, Kettering. The first directors (to number not less than three nor more than five) are W. Cunliffe, H. F. Henson and W. P. Symonds. Qualification, £500. Remuneration, £100 per annum, divisible.

Italian Building and Trading Co., Ltd.

This company was registered December 12th by Clements, Williams, and Co., 17, Gresham House, E.C., with a capital of £50,000 in £5 shares, to take over and carry into effect concessions by the Corporation of the City of Licata (Sicily) for the construction of certain public works; to construct and maintain a new dry dock and engineering works, with patent and other slips, workshops, warehouses, plant, machinery, conveniences, piers, wharves, &c; and, further, to acquire any mines, mining, water and other rights, grants, leases, claims, concessions, options of purchase, metalliferous land, alluvial ground, mineral deposits, &c., and to carry on the business of a mining, smelting, and trading company in all its branches. The first directors (of whom there shall be not less than three nor more than eleven) are to be elected by the signatories. Qualification of first, £200; of subsequent, £100. Registered office, 9 and 10, Great Tower Street, E.C.

Steriken, Finnis and Sons, Limited.

This company was registered on December 12th by Speechly and Co., 1, New Inn, Strand, with a capital of £50,000 in £10 shares, to acquire the business of timber merchants, &c., carried on by F. Finnis, under the style of Steriken, Finnis and Sons. The first directors (of whom there shall not be less than three nor more than five) are F. Finnis and A. E. C. Lane. Qualification, £1,000; qualification of chairman (F. Finnis), 200 ordinary shares, his remuneration being £800 per annum. No remuneration of ordinary directors given.

Grimsby Brick Company, Limited.

This company was registered on December 19th by Shaw and Sons, Fetter Lane, E.C., with a capital of £10,000 in £5 shares, to acquire land, buildings, &c., and to carry on the business of builders' merchants, brick and tile manufacturers and vendors, quarry owners, coal and iron merchants, &c. The number of the directors and the names of the first are to be determined by the subscribers. Qualification, £50.

Mill Hill Slate Quarries Syndicate, Ltd.

This company was registered on December 19th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £2,500 in £50 shares, to acquire the Mill Hill Slate Quarry, near Tavistock, Devon, to adopt an agreement with J. P. Ecles, J. B. James and C. E. Parsons, and to carry on the business of quarry and mine owners, slate merchants, &c. Registered without articles of association. Registered office: Central Chambers, Newport, Monmouthshire.

A. E. Wilson, Limited.

This company was registered on December 19th by T. Richards and Co., 44, Finsbury Square, W.C., with a capital of £2,000 in £1 shares, to acquire and carry on the business of a builder and contractor now carried on by A. E. Wilson at Northwood, Middlesex, and at Watford, Hertfordshire. The first directors (to number five) are to be appointed by the subscribers. Qualification, 100 shares. Remuneration as fixed by the company.

Lodge Holes Colliery Company, Limited.

This company was registered on December 19th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £5,000 in £1 shares, to carry on the business of colliery proprietors, miners, coal merchants, coke manufacturers, brick and tile makers, &c. The first directors (to number not less than three nor more than five) are J. H. Smallman (managing director), S. Skidmore, H. Farker and I. Williams. Qualification, £300. Remuneration, £200 per annum for the managing director and £50 each for the others. Registered office: Bank Chambers, Wednesbury, Staffordshire.

David Chatterton and Sons, Limited.

This company was registered on December 15th by Maffey and Brentnall, 19, St. Dunstan's Hill, E.C., with a capital of £3,000 in £1 shares, to acquire the business carried on by Joseph Chatterton and William Chatterton, as David Chatterton and Sons, at the Granite Gritt Sett Quarries, Upper Mill, in the county of York, and to carry on the business of quarry owners &c. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers. Qualification, 500 shares. Remuneration as fixed by the company.

Crewe Building Materials and Hardware Company, Limited.

This company was registered on December 21st by A. H. Atkins, Limited, 23, Bouverie Street, E.C., with a capital of £1,000 in £5 shares, to carry on the business of brick, stone, sand, lime, timber, and hardware merchants, carpenters, woodcarvers, electrical engineers, &c. The first directors (to number not less three nor more than seven) are C. R. Wooldridge, J. Bebbington, J. Griffiths, W. Micklewright and E. G. Smith. Remuneration as fixed by the company.

Trade and Craft.

HEAT AND AIR.

The most important advantages of the "Small Tube" hot-water heating apparatus made by Messrs. John King, Limited, warming, ventilating and lighting engineers, of Benson Street, Liverpool, are that the size of the piping (about 1¼in.) allows it to be introduced into all parts of the room or building; it is made of the best wrought-iron and can be bent neatly into all recesses; there is a great saving of fuel as compared with open fires, the cost being as 1d. to 7d.; and the apparatus is simple and maintains a uniform temperature. Part of the piping is arranged to form a coil, which is placed in a heater, and beyond putting a small amount of water in the pipes about once a month there is nothing to do except to clean out the ashes and keep up the fire. The apparatus is therefore very easy to manage, which is naturally a great desideratum in view of the fact that it might be in the hands of someone devoid of any knowledge of its working parts. C. Smedley Beck, Esq, Sandringham, writes to Messrs. King as follows:—"The hot-water heating apparatus as supplied and fitted up by you for H.R.H. Prince of Wales is a genuine success." In the "College" grates made by the firm there is a warming chamber at the back into which fresh air is admitted, and, after being warmed by the waste heat at the back and sides of the grate, is carried up through a flue and supplied to the room through a regulating louvre near the ceiling. Though this has the advantage of heating the room more efficiently than an ordinary grate, it possesses the disadvantage of all apparatus employing air flues or trunks namely, that if they are not periodically cleaned they will pollute the air that passes through them. Messrs. King also make a "Helios" hospital stove; a "Madeiran" stove for the combined warming and ventilation of churches, chapels, schools, &c.; a "Triumph King" heater; and "Peer" and "Peerless" warm-air stoves, which are of pleasing design. Of air-inlets and ventilators there is a great variety, the "Rex" invisible roof ventilator being made to the pitch of the roof, and thus being practically out of sight. The "Rajah" and "Rahnee" radiators made by the firm have a very good appearance and the castings are clean.

COMING EVENTS.

Wednesday, January 3.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.—Ordinary Meeting of members at 8 p.m.

Thursday, January 4.

CIVIL AND MECHANICAL ENGINEERS SOCIETY.—Mr. W. A. Francken, A.M.I.C.E., on "Well Foundations in India." 8 p.m.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Arthur Thomson, M.A., M.B., on "The Anatomy of the Human Form: The Upper Limb."

Friday, January 5.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Lewis F. Day, on "Ornamental Design.—I."

ARCHITECTURAL ASSOCIATION.—(Discussion Section.) —Mr. V. H. King, on "The Public Monuments of London, architecturally considered."

Saturday, January 6.

SANITARY INSPECTORS' ASSOCIATION.—Extraordinary General Meeting at Carpenters' Hall, London Wall, E.C. New Year's Address by the President, Sir Hugh Gilzean Read, J.P., LL.D., D.L.

Monday, January 8.

LONDON INSTITUTION.—Mr. Alfred H. Fison, D.Sc., F.R.A.S., on "Photographs in Natural Colours." 4 p.m.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Professor Goodman A.M.I.C.E., M.I.M.E., on "Steel Construction in Buildings." 6.30 p.m.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—General Business Meeting. 8 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. Herbert Bryans on "Stained Glass."

Tuesday, January 9.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Sir C. Cameron, F.R.C.S.I, on "Pigments." 8 p.m.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS. —Mr. T. Walter L Emden, J.P., P.S.A., on "Suggestions for dealing with the Law as to Light and Air in Building Cases."

INSTITUTION OF CIVIL ENGINEERS.—Mr. Reginald A Tatton, M.I.C.E., on "The Purification of Water after its use in Manufactories," and Mr. W. O. E. Meade-King, M.I.C.E., on "Experiments on the Purification of Waste-Water from Factories." 8 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BOURNEMOUTH.—For constructing 27in. cast-iron and other relief sewers in the Ashley and Waterloo Roads, Vale and Church Roads, and Poole, Seamoor, and Alumhurst Roads, and other works in connection therewith, for the Borough of Bournemouth. Mr. F. W. Lacey, Borough Engineer and Surveyor:—

J. and T. Binns	£4,156	Grounds and Newton, 12, Triangle, Bournemouth*	£3,734
Cooke and Co.	3,937		

* Accepted.

BURY ST. EDMUNDS.—Accepted for the erection of two pairs of cottage villas. Mr. R. Mawhood, architect, 2, Market-road, Chelmsford:—

H. Frost, Westgate-road, Bury ... £1,02[illegible]

HITHER GREEN.—For the erection of schoolroom, class-rooms, and manse at Torridon-road, Hither Green, for the trustees of the Bible Christian Church. Mr. E. J. Hamilton, architect, 2, New-road, Brighton:—

Foster Bros.	£3,745 0 0	Bush and Son	£3,410 0 0
E. Jones	3,680 1 5	Hibberd Bros.	3,288 0 0
Castle and Son	3,600 0 0		

*Accepted.

LONDON.—For the erection of new premises, Finsbury circus and London-wall. Messrs. Davis and Emanuel, architects. Quantities by Mr. Walter Lawrence:—

Holloway Bros.	£243,605	Foster and Dicksee	£ 27.600
Hall, Beddall, and Co.	241,713	B. E. Nightingale	227,325
J. Carmichael	23[illegible],108	Cubitt and Co.	226,453
Trollope and Sons	236,800	Colls and Sons	225,900
Higgs & Hill, Ltd.	235,666	Patman and Fotheringham	223,840
Holland & Hannen	234,770	H. Lovatt	214,650
Lawrence and Sons	233,768		

LONDON.—For improvements at Holden-street Schools, for the London School Board. Mr. T. J. Bailey, architect:—

Holloway Bros.	£13,895	B. E. Nightingale	£12,875
Lawrance and Sons	13,552	Stimpson and Co.	12,645
Spencer, Santo, and Co., Ltd.	13,137	Edwards and Medway	12,500
Longley and Co.	13,075	Kirk and Randall	12,228
Lathey Bros.	12,889	Johnson and Co., Ltd.	11,930

* Accepted.

MELTHAM.—For laying about two miles of earthenware and cast-iron pipe sewers, for the Urban District Council. Messrs. J. B. Abbey and Son, engineers, 31A, New-street, Huddersfield:—

Waring and Sons	£4,558 11 6	R. Turner	£2,870 0 0
R. Walker	3,877 0 6	Mallinson and Sons, Lockwood, Huddersfield	2,249 0 0
H. Bentley	3,477 16 6	Matthew Hall and Son	2,007 6 5
J. E. Kaye	3,300 0 0		
Walker and Co.	3,071 2 5		
A. Graham and Sons	3,027 0 0		
B. Graham and Sons	2,919 0 0		

OXFORD.—Accepted for additions to Messrs. Elliston and Carell's premises, Magdalen-street, Oxford. Mr. Herbert Quinton, architect and surveyor, 22, George-street, Oxford. Quantities by Mr. J. A. Thompson, 50, Lincoln's Inn-fields, London, W.C.:—

Kingerlee and Sons ... £8,841 16 10

WOODSEATS (near Sheffield.—For new steam laundry: No. 1 Contract. Mr. J. P. Earl, architect, Sheffield:—

J. H. Hirst	£2,325	Margerrison and Son*	£2,300

* Accepted.

WRITTLE (Essex).—For the erection of four cottages on Oxney Green. Mr. R. Mawhood, architect, 2, Market-road, Chelmsford:—

H. Keunele	£998 0	J. Lowe*	£790 10
J. Moss	875 0		

*Accepted.

[All of Writtle.]

CONTRACTS OPEN.

COUNTY BOROUGH of BRIGHTON.

TO CONTRACTORS AND OTHERS.

Notice is hereby given that the Council of the said County Borough will receive TENDERS from such persons as may be willing to enter into a contract for the CONSTRUCTION of an UNDERGROUND CONVENIENCE, together with sundry Works connected therewith around the base of the Clock Tower, Queen's-road, Brighton.

The specifications, forms of Tender, and bills of quantities may be obtained on application at the Office of the Borough Engineer and Surveyor, Mr. FRANCIS J. C. MAY, Memb. Inst. C.E., at the Town Hall, Brighton, on payment of Three Guineas, which will be returned on receipt of a bonâ-fide Tender.

Sealed Tenders, addressed to me and endorsed "Tender for Construction of Underground Convenience," must be left at my Office, at the Town Hall, before TEN o'clock in the forenoon, on FRIDAY, JANUARY 19th, 1900.

Power is reserved to reject the lowest or any Tender.

FRANCIS J. TILLSTONE,
Town Clerk.

Town Hall, Brighton,
December, 1899.

SHEFFIELD UNION.

NURSES' HOME AND INFIRMARY LAUNDRY AT FIR VALE WORKHOUSE.

The Guardians of the Sheffield Union invite separate TENDERS from building contractors for the whole of the works required in the ERECTION of (1) a NURSES' HOME and (2) a LAUNDRY, in connection with the Workhouse Infirmary at Fir Vale, Sheffield, in accordance with plans and specifications prepared by Mr. EDWARD W. MOUNTFORD, F.R.I.B.A., Architect, 17, Buckingham-street, London.

Plans and specifications may be seen, and quantities and forms of Tender obtained, at the Union Offices, Westbar, Sheffield, on payment of a deposit of £1 1s., which will be returned on receipt of a bonâ fide Tender. Tenders must be sent to me here on or before TWELVE o'clock noon on SATURDAY, JANUARY 20th, 1900. The contract will contain the fair contract clause adopted by the Sheffield Board of Guardians, a copy of which will be supplied, and the Guardians do not bind themselves to accept the lowest or any Tender.

By order of the Board,
ALBERT EDWD. BOOKER,
Clerk to the Guardians.

Union Offices,
Westbar, Sheffield,
December, 1899.

THE BOARD of WORKS for the LEWISHAM DISTRICT.

TO BUILDERS, CONTRACTORS AND OTHERS
PUBLIC LAVATORIES AND SANITARY CONVENIENCE.

The Board is prepared to receive TENDERS for the BUILDING of PUBLIC LAVATORIES and a PUBLIC SANITARY CONVENIENCE in High-street, Lewisham.

Plans and specification of the proposed Lavatories and Convenience, form of contract, and general conditions, may be seen at these Offices (Surveyor's Department).

A copy of the bills of quantities and forms of Tender may be obtained on payment of a deposit of £1 1s., which will be returned on receipt of a bonâ-fide Tender.

The Tenders must be on the forms issued by the Board, inclosed in an envelope, sealed, and endorsed "Tender for Lavatories, &c.," and must be delivered by FOUR o'clock on TUESDAY, JANUARY 23rd, at the Offices of the Board, and placed in the box there provided for the purpose.

The Board does not bind itself to accept the lowest or any Tender.

By order,
EDW. WRIGHT
Clerk of the Board.

Lewisham Town Hall,
Catford, S.E.
December, 1899.

DRAINING BUILDINGS HAVING NO OPEN SPACE.*

By Major LAMOROCK FOWLER, F.R.Met.Soc.

THE object of this paper is discussion on a problem which is frequently found in practice. In early days, drainage and sanitary requirements seem to have been about the last things the designer of a building thought about; only very recently some unpleasant facts were noted in connection with an important building recently erected in the west end of London. In this case all soil pipes were put *inside* the building, in defiance of the London County Council by-laws and the requirements of sanitary science. It is scarcely possible to conceive a case where the building is so isolated as not to have an approach to it; there are, however, numerous examples, especially of business premises, which, save the frontage to the street, are totally enclosed and have no open space, not even to vaults under the pavement. The author suggests that it is quite possible to deal with a typical case as follows:—

We must start by following modern sanitary axioms in the design, namely, no connection must be made with the sewer or cesspool into which the sewage is discharged; an intercepting chamber and a disconnecting trap must be provided, and on the house side of the trap an inlet for fresh air must be put in, which must be done without trespassing on the street; the drain must have a current of air passing throughout its entire length and out into the open through the soilpipe, which must be carried up full bore in a right line and open some 4ft. above all windows, and the soilpipe must not be inside the building; the discharge from bath, lavatory, sink, &c., must not enter the soilpipe nor the drain, save through and over a properly-trapped gully open to the air.

There must be also an inspection chamber at the head of the drain, and this must not be inside the building.

We should proceed as follows: First, carry up a shaft about 8ft. square in the rear, and taken out of the building—of course, fully open to the sky. In the base of this shaft put properly-trapped gullies to receive the bath and other wastes and the rain water, and proo vide a proper inspection chamber. Arrange te place the w.c.'s on one of the three sides of tht open shaft; fix the soilpipe in a convenienplace, and carry it up straight, full bore, open at the top, the bottom connected direct with the drain. Where several w.c.'s are connected to the soilpipe, one over the other, provide a proper anti-syphonage pipe, 2in. in diameter. Thus, by taking a shaft out of the building itself, we shall overcome the difficulty of possessing no open space, so far as the rear of our building is concerned. The w.c.'s, lavatories, bath rooms, &c., can also have free ventilation. The staircase may also be so planned as to get light from the shaft, and provision is made to allow the free passage of air from the front. It is not necessary to refer to other sanitary details, which naturally follow.

We now have to arrange matters in front. The intercepting chamber may be arranged in an air-tight closed vault, taken out of the basement, open only to the street by a hinged grating opening inwards, the opening being large enough for the passage of a workman to examine the trap and drain. The height of the vault must depend upon the level of the ground floor. Three feet above the level of pavement would allow sufficient air, and the plan may be, like the rear shaft, 8ft. square. In this vault put in an ordinary fresh air inlet on the house side of the trap, as before. Thus, we have solved the difficulty of "no open space" in front. The drain in this case perforce must pass under the house and may be of iron properly jointed; and if of iron, it is quite possible to put in an iron soilpipe of proper weight and properly jointed, and efficient junctions of the w.c. apparatus be cared for. Or the drain may be of 6in. glazed stoneware properly jointed, set in a bed of concrete and surrounded by good Portland cement concrete.

Another way of draining a house "possessing no open space" is to carry up a shaft as already described on one of the flank walls of the building and taken out of it as before. In this case we should have only one inspection chamber; this must have an intercepting trap and other details as before mentioned. Access to the shaft may be by a door in the basement. In this case the soilpipe must pass into the chamber on the house side of the trap, and the only air inlet would be for the soilpipe, as the drain would pass direct to the sewer beyond the intercepting trap. All other conditions to remain the same as already noted.

---

[*] A paper read before the Annual Congress of the Sanitary Institute, held at Southampton on August 29th, 30th, and 31st.

STEEL SKELETON STRUCTURES.

By C. H. BLACKALL.

THE following is a summary of a paper on "The Legitimate Design of the Architectural Casing for Steel Skeleton Structures" by Mr. C. H. Blackall, read before the Thirty-third Convention of the American Institute of Architects, held at Pittsburgh:—In its fundamental sense the application of skeleton construction to buildings is as old as architecture itself. But, in its application to a many-storied structure, it is entirely of the present day, and almost of the present decade. Skeleton construction was mothered by necessity, and found architects unprepared. Consequently, the first attempts to carry a building through many storeys, employing the post-and-girder construction within and without, were hardly what may be termed successes. But although it is less than twenty years since the first perfected struction of this type was put before the world, it is fair to say that the methods of design for tall structures have crystallised into lines which are both logical and rational, and which have been very generally accepted. In this respect our modern tall office-buildings have shown what can fairly be termed a true development of style, and in this respect it seems fair to say they can rank with the productions of the great building periods of the past; for the typical design for an early Christian church, a Greek temple or a Gothic cathedral was hardly more fixed in its general essential characteristics, in the division of parts, the scheme of design, and the essence of the decorative treatment, than our modern commercial buildings. Rightly or wrongly, if we may fairly judge by the majority of tall buildings which have been erected of recent years, there is a distinct principle involved in architectural design as applied to a building of ten storeys and upwards. The principle is so logical and commends itself so thoroughly to one's judgment that, however much we may differ as to matters of detail or characteristics of individual style, or however much variance of opinion there might be as to the inventive qualities manifested, it is surely acknowledged that there is a right and wrong way to design a tall office building.

If I recollect rightly, the first of the skeleton-constructed buildings—namely, the Home Life Building, Chicago—was built of cast-iron columns, extending only through a single storey; it was a regular post-and-girder construction, in its essence comparable to a series of square tables placed one upon the other. The design of the exterior followed the same scheme; that is to say, each storey was by itself, with string-courses marking all the floor-levels, and a succession of similar stories piled one upon the other without a very marked proportion between the whole height and the individual parts. This was the early scheme adopted, and was the style which has been followed practically in all the buildings of a date previous to 1880. It was constructed essentially from an æsthetic standpoint that the floor-lines should be marked on the exterior by a projecting course, and while the buildings were of relatively low height—that is to say not over 100ft. high—this scheme presented certain advantages, and was an easy, if, perhaps, not altogether satisfactory, solution of the problem. Only rarely in the earlier designs was an architect bold enough to attempt to omit an occasional floor-line, and run a decorative treatment, either pilasters or plain wall-surface, through more than one storey.

About the time that the skeleton-construction was taking shape in the West a different scheme of design for the exterior of a tall building was started by the De Vinne Press Building, in New York. This building followed what might be termed the aqueduct style, and in a certain sense was a transition between the post-and-girder style where each storey is projected and the present, in that several stories were thrown together and connected by heavy arches at certain floor-levels. This aqueduct style has found a great deal of favour at the present time, and, with several modifications, has been incorporated in some of our best buildings. In the later buildings, however, it merges into a feature of the whole rather than a predominating motive. The trouble about it is that an arch is not, generally speaking, a desirable factor in any commercial building. The skeleton-construction was an outcome of a stern practical necessity and the design which best suits this construction is one which gives the maximum amount of light, and, consequently, a large arch, however imposing it is admittedly as a feature of the building, is not the most suitable form for an office-building measured by the effect on the outside.

Neither the so-called post-and-girder nor the aqueduct style has seemed to just fit satisfactorily the design of a building reaching up through twelve or more storeys. The monotony of repeating row after row the numerous floor-lines, the difficulty of getting a proper feeling of scale for the building as a whole, added to the impossibility of capping the structure with a cornice which shall have any fair proportion between the order for the storey immediately beneath it and the whole building, have led to what can be termed the columnar form of design, in which the building is treated as a whole, hardly any attention being given to the window openings as such, in which the façade is constructed in much the light of a column and given a strongly marked base, a plain shaft and a rich crowning capital, The essential principle which seems to be most in favour with all these high buildings is to treat the façade not as an aggregate of individual units, nor as a spacing or grouping, nor combination of openings, but as a whole treated as a whole and with all the decorative members proportioned to the whole height, the richness being concentrated at the bottom and the top.

It might be said, with a certain degree of truth, that all I have said applies to a high building rather than to a steel skeleton-construction, and that I am avoiding the real point at issue. As a matter-of-fact, however, it is doubtful if the present scheme of design for tall buildings would ever have been evolved except as the opportunity arose in connection with the structures which were extended so far beyond anything that was dreamed of in the old ante-elevator days. The topic of construction is a somewhat deeper one than I have thus far touched upon, and involves more the question of fitness of the individual style rather than the scheme of the design as a whole. In other words, are we to-day clothing our architectural forms, especially in our high buildings, with the right kind of ornament? Or, to embody the thought of the extreme eclectics in design, are we following the path of righteous and safe development when we adhere even indirectly to the forms we have inherited from the Classic and Renaissance period, or should we, rather, break away from the precedents of the past and attempt, as we develop a new construction, to at the same time develop a new overcoat for our architectural thoughts? This involves a consideration of what constitutes legitimate sign. Illegitimacy, as we all know, is defined unrecognised parentage. Measured by this finition, the Romantic school of to-day may ave parentage but certainly not ancestors, hereas the most truly legitimate of all archi- ctural designs is the one which has survived, its various modifications, through the wreck the Roman Empire, the untoward influences the Vandals and the Goths, and has come us strangely modified, perhaps wonderfully rtured in some details, but still intact in spirit ter all the scathiug modern episodes of the eo-Greek, Eastlake and English Gothic, to y nothing of our own vernacular. It is a pretty fe rule in this world, when you want to do thing with the least trouble and the greatest robable chance of success, to first of all find ut how other people have done it, and how ey have succeeded. Styles change, or rather e fashion of architecture is not a permanent ne. In the last twenty-five years the whole spect of the profession towards architecture, its decorative sense at least, has been completely changed, and we are now admiring the ind of work which a score of years ago was ontemptuously cast aside. Are we, then, to uppose that the present style, if I may so esignate the Classic and Renaissance revived ehicles, is also to pass as some of us trust the xtreme *fin-de-siècle* French manifestation is assing? Undoubtedly the fashion will hange, and yet it seems to me that an artistic xpression which has found favour with the reater proportion of the civilized world ever ince the year one has the best chance of long ife and continued prosperity; and if we are o take an individual style we are safer in ollowing pretty closely the lines of Classic rchitecture and Italian Renaissance, and here is more hope for a good copy than there s for a bad original.

But some of the purists tell us that it is bsurd on the face of it to borrow the motives rom the three and four storey Italian alaces and apply them directly to structures which soar up into the scores of stories, nd they would have us cast aside tradi- ion, and, by a kind of making the unishment fit the crime, cover our gaunt nd ugly skeleton of steel with some- hing which in a mysterious, unheard-of way shall be peculiarly metallic and pecu- iarly *sui generis.* Now there is no disputing n matters of taste, and I might argue from now to doomsday to prove that the Renaissance mantle is the proper design to be applied to a skeleton construction without convincing anyone who thought differently. But I entirely fail to see any lack of appropriateness in using for our own the motives from the past, and though it is very easy to charge against our present architecture that it is effete and lacking individuality, the same might be said of our language or of our methods of arithmetical notation. The changes in our architecture have kept pace pretty fairly with the changes in our speech. Both derived their roots and many of their forms from the past, and that fact in nowise militates against their use. There are certain fundamental forms which have marked the progress of architecture ever since the Beni-Hassan rock-cut temples. They are just as applicable to-day as they were centuries ago. The column long ago ceased to be purely a constructive member. The Greeks, with all their stickling for purism, did not hesitate to simulate in a facing of stone the post-and-girder construction of their roof carried out in the triglyphs and metopes. Nor did they feel any æsthetic sin in marking the ends of their walls with an engaged pilaster which was not a constructive necessity, and though it is very easy to argue that a column is always a column and is not properly used unless it actually supports something, it is also equally fair to claim that the column and pilasters have their distinct decorative functions quite aside from any structural necessity, and that the end justifies the use of these features when they merely serve their decorative purpose. If we were to simply transplant our pilasters and stick them around promiscuously on the face of a twenty-storey building, or even go to the absurd extreme of running these same pilasters through many stories and crowning them with a classically-proportioned cornice, the absurdity of such a treatment would be too manifest to require comment. The past decade has seen the evolution, we believe, of the Classic column, in modified proportions and in varying proportions, which has enabled us to use this most effective form of architectural adornment as applied in our tall buildings. In the very nature of things, we cannot construct a building which shall show its skeleton construction inside and outside except by inference. Our reason tells us that most tall buildings must be constructed with columns, concealed with masonry. We get accustomed to some architectural forms slowly. In a wooden house, for instance, we feel quite safe in ignoring all the construction, running our clapboards around the building as though such a thing as studs did not exist, and after carefully studding up the walls of a house, we will plant on the outside some imitation half-timbered work without causing a very serious wrench to the feelings of our pure-minded friends.

After all, I confess that, in matters architectural, I am a good deal of a Jesuit, and believe that the end justifies the means. The first essential requisite of an architectural structure, according to my mind, aside from matters purely of strength and stability, is that it shall be beautiful—beautiful in the fullest meaning of the word, the beauty which results from proportions which please, even if they cannot be subtly analysed, beauty which satisfies the trained mind from its coherency, and beauty which will endure through at least the life of the one who created it. I am not arguing that the tall building of to-day is an altogether desirable feature of modern civilisation. It is an outcome of necessity, and there seems to be more reason to believe that our buildings of the future will be higher rather than that they will be lower. The tall building is with us and some of our architects have been able to demonstrate beyond question that it is possible to create a tall building in a thoroughly architectural manner which shall present a thoroughly pleasing *ensemble*—the details, after all, will take care of themselves. And the question of absolute fitness of Renaissance, of the Gothic or of any other style need not trouble us half so much as the question of whether the completed building is yet architecturally beautiful.

I will recapitulate what, as a matter of individual personal feeling, I can safely affirm as my architectural creed anent these buildings. First, the most successful type of design is one which treats the front as a column with a marked base, square edged, rather small windows spaced regularly over a plain shaft, and a rich, blooming capital, proportioned to the height of the whole building. Second, the safest vehicle for expressing the ornamental details of a building is the Classic or the Italian Renaissance, because it is a style which was evolved under conditions much similar to our own and is one which affords infinite variety in mass and the utmost delicacy and beauty in detail. And, finally, no matter what we do, if our hearts be true and our buildings beautiful.

West Ham Improvements. — The Corporation of this borough seek Parliamentary powers which include :—For tramway purposes, £210,000; street works, £275,000; generating station, £210,000; workmen's dwellings, £1,675,000; and municipal lodging-houses, £130,000.

Halstead Workhouse has had its drainage system entirely remodelled. All sewers under the buildings are cased with 6in. of cement concrete and are ventilated by 6in. cast-iron shafts. The main sewer is of 9in. diameter, tapering to 6in. in places. A new concrete floor has been laid down in the washhouse, and three glazed stoneware baths (each weighing 8cwt.) and some new water-closets have been provided. The boys' new day-room has a wood-block floor and distempered walls. Messrs. Clare and Ross, of Chelmsford, were the architects for the work (which has cost £625), and Mr. George Sharpe, of Halstead, was the contracter.

THE HOUSING PROBLEM.

THAT well-known member of the House of Commons, "Mabon" (Mr. W. Abraham), has been giving his views on the housing problem through the columns of the "South Wales Daily News." The matter has now been discussed so much from one standpoint and another that it would seem some really and substantially satisfactory solution was bound to result; but the difficulty becomes greater and greater every year, though, as "Mabon" says, of all the conditions affecting the life and welfare of the community, there is not one which is of more vital inportance than the houses in which the masses of our people live.

Public opinion and the attention of Parliament have been directed to this question for the last fifty years, and the most casual inquiry shows that the health and character of the people of this country are grievously injured by the miserable conditions in which such large numbers of the people are condemned to live. The extent of the evil is recognised by, or, indeed, really known to, but very few. In large towns thousands of families have only one room for living and sleeping in, and to anyone with but a dull imagination it is dreadful to contemplate what life must be under such conditions. It is small wonder that in districts where there are many one-roomed tenements there are two deaths to every one in the country district.

This appalling waste of human life which exceeds the waste of the bloodiest war, can be prevented. Many towns have during recent years done a great deal in demolishing some of their worst areas.

In Bethnal Green, within the City of London, fifteen acres of slums have been cleared at a cost of £266,000, and some 3,200 people were affected in so doing. Dwellings were erected on ten other sites at a total cost of £300,000. Many of the latter buildings, after allowing for expenses, interest, and sinking fund, show a profit. Quite recently very large operations have been carried out by the London County Council for the provision of workmen's dwellings.

Some years ago the Glasgow Corporation obtained power to buy eighty-eight acres in the centre of the city, inhabited by over 51,000 people. The Corporation has spent nearly £2,000,000, and the scheme is becoming self-supporting and will soon yield a profit. The Corporation has also built lodging-houses, with a charge of 3½d. and 4½d. per night, and artisans' dwellings let in tenements from one room upwards. A municipal family home, with a common dining hall, recreation room and kitchen, and 160 rooms has also been erected, heated with hot water, and lighted with electricity, with a playground and a crèche. The charge for a mother and one child is 3s. 2d. per week; children's board, 1s. 10d. per week. Altogether, over £4,000,000 has been expended on private schemes and artisans' dwellings in Glasgow.

In Liverpool the Corporation built a hundred tenements, which were opened in 1891, and 271 tenements, opened in 1895. Houses have recently been erected in the Scotland Ward, the most crowded part of Liverpool, where the sanitary conditions previously were so bad that the death-rate was 40 per 1,000—considerably more than double the normal rate. The rent is 2s. 6d. per week for two rooms and a scullery, with the use of the yard, &c.

Great as these and kindred evils are, much may be done even under existing laws to remedy them. Medical officers of health and urban and rural district councils have very large powers under the Public Health Acts. By these Acts "any house or part of a house so overcrowded as to be dangerous or injurious to the health of the inmate" and "any premises in such a state as to be injurious or dangerous to health" are declared to be a nuisance, and power is given to the local authority to deal with such nuisance and to order repairs and alterations.

If the owner does not comply with the requirements of the authority, proceedings may be taken before the magistrates, and the house may be closed without compensation. In some localities very good work has been done under these Acts, but in many, perhaps in most, districts, the local authorities and their officers have done little, or nothing.

But even larger powers are given by the Housing of the Working Classes Act of 1890, under which an Urban or Rural District Council may clear away an entire district if it is proved to be so unhealthy that demolition is the only remedy.

A Council may also compulsorily buy land and build houses. One of the most valuable features of this Act is the power which is given to the inhabitants of the district to put the law in motion if the Council neglects to do so.

Can damages be recovered by tenants of insanitary premises? is one of the most important questions in this connection at present. For after all the most effective mode of doing away with the insanitary conditions of the habitations of the poorer classes would be the knowledge of the fact that the owners of such premises could be made responsible by law for allowing such conditions to exist. To put such owners to the test occasionally, as it is evident can be done, would tend materially to reduce the dangers from the insanitary conditions of workmen's houses.

A case in point. The Housing of the Working Classes Act of 1890 enacts that "In any contract made after the 14th day of August, 1885, for letting for habitation by persons of the working classes a house, or part of a house, there shall be implied that the condition of the house is at the commencement of the holding in all respects reasonably fit for habitation." This provision applies to the letting of a house or part of a house at an annual rent not exceeding the following amounts: As to England, if the premises are situated in the Metropolis, £20; at Liverpool, £13; at Manchester or Birmingham, £10; elsewhere, £8. In Scotland or Ireland, £4. On August 27th, 1898, the wife of a painter, whose average wage was £2 a week, acting upon her husband's instructions, took, at a weekly rent of 6s., the basement of a house in Paddington. Between December, 1898, and the expiration of the tenancy the children of the painter suffered from various illnesses. The house was condemned as insanitary by the sanitary inspector, and the painter sued the owner of the house for damages. The County Court judge said that upon the evidence there could be no doubt that the drains of the house were out of order, and that the premises had not been "reasonably fit for human habitation" for some time previous to January, 1899, and the question was whether the right inference to be drawn from the evidence was that they were out of order and unfit for habitation at the commencement of the holding on August 27th, 1898. The judge held that such was the right inference, and that the plaintiff was entitled to recover from the defendant the damages, which he fixed at £19. From this amount of £19 the judge allowed defendant to deduct 12s. for rent due to him, and gave judgment in favour of plaintiff for £18 8s. and costs, leave to appeal being allowed.

At Manchester the Sanitary Committee have decided to recommend to the Council the purchase of a large plot of ground in the district of Higher Blackley, within three miles of the Royal Exchange. The estate contains an area of about 237 acres, and the price at which the Committee can become the owners is £150 per acre, inclusive of all mineral rights. As the chairman, Mr. Alderman McDougall, pointed out at a special meeting of the committee the other day, the total cost would be something like £36,000. Nothing is decided as to what course shall be adopted in utilising the ground, or what shall be the character of the houses to be put up, beyond, of course, the broad fact that they will be adapted to the needs of the working classes.

The late city engineer of Liverpool, Mr. Percy Boulnois, built in 1896 a number of three-storey tenements in Gildart's Gardens. The idea was to let them for 1s. per room per week; the rents have actually worked out at 2s. 6d. and 2s. 9d. a week for two rooms and a scullery, and 3s. 6d. for three rooms and a scullery. It has been asked why, if this can be done and made to pay a return of 4 per cent. in Liverpool, it cannot be done also in London. As the "Economic Journal" points out, there is first of all a great difference in the value of the land; in Gildart's Gardens it is about 12s. a yard, but in London it would be nearly double that amount. The cost of building is also different in the two cities. For instance, a foreman's weekly wages in London are about £3 10s., in Liverpool £1 less. In Liverpool 1,000 bricks are bought and delivered for 1s. 6d., in London for 2s. 2d. Cartage is about 6d. a load more, and the wages of bricklayers, joiners and labourers, are all higher in London than in the North. In some cases also the London Building Act requires a greater expenditure than do the regulations in force in Liverpool. The rooms in London would have to be 8½ft. high, instead of 8ft. as in Gildart's Gardens; the party-walls would have to be carried through and above the roof instead of stopping underneath. The rooms in Mr. Boulnois's cottages are smaller than those built according to the regulations of the London County Council. There are also important differences in practice, while in Liverpool there is close co-operation between the different departments of the public service. Mr. Boulnois was able to use old tramway rails instead of steel joists for his floors, and these were transferred from the Tramway Department at £2 10s. per ton, £1 10s. being the price for a ton of scrap iron, and £1 the charge for cutting the rails to the required length. The clinker from the corporation dust destructor—a waste product of a waste product—was utilised for making cast concrete steps. Materials were supplied according to the standing contracts of the Health Department. These and other savings have not been within the reach of the London County Council. In London over 55 per cent. of the gross rental is absorbed in expenses of management, repairs, and the like, while in Liverpool 40 per cent. has been allowed.

Masters and Men.

The Strike of Joiners at Halifax still continues.

Painters' Wages.—The Trade Union Painters in the Walkden District of South-east Lancashire have applied for an advance of ½d. per hour on their present wage of 8d., and for certain alterations in the working rules.

The Abstract of Failures in 1899 shows that in the building and timber trades 645 bankruptcies have occurred as against 535 in 1899, 425 deeds of arrangement as against 406, and 539 bills of sale in 1899 as against 572 in 1898.

International Trades Unions Federation.—It is stated that with the advent of the New Year special efforts are to be put forth with a view to establishing an International Federation of Trades Unions. Communicating with the English Amalgamated Society of Carpenters and Joiners, through Mr. Macdonald, secretary of the London Trades Council, Mr. J. Jensen, chairman of the Associated Trades Unions of Denmark, thinks that at the next International Congress some scheme should be agreed upon for an international understanding between the workers of all countries, in order that they may be able to withstand any international coalition of the employing classes.

The Amalgamated Society of Carpenters and Joiners has opened a new branch in Aberdeen. The total membership of the Society is now 61,725, and the number of branches 771 (at the end of 1860, the year in which it was started, the total membership was only 618, and the number of branches 20). The total income for one year is £142,766, and at the present time the cash balance amounts to £172,712. During 1898 the unemployed benefits paid amounted to £13,462; accident benefits £4,500; superannuation benefits, £14,663; and funeral benefits, £5,788. The branches of the Society are not confined to the British Isles, but extend to the United States of America, Canada, Australia, New Zealand, Cape Colony, and the Transvaal. In the latter place, unfortunately, the branches are closed on account of the war.

Strikes and Lock-outs in 1898 are reported on by Mr. J. Burnett, Chief Labour Correspondent of the Board of Trade (Labour Department) in a Blue-book which has just been issued. It is prefaced by a note by Mr. H. Llewellyn Smith, the Commissioner for Labour, who points out that the 711 disputes of 1898 were almost entirely dominated by the influence of the great dispute in the South Wales coal trade. The total aggregate duration of disputes during the year, amounted to over 15,000,000 days. If the coal trade and engineers' disputes be omitted, the year was singularly free from important disturbances, the aggregate duration of all the other disputes during the year being only about 2,500,000 working days. During the first eleven months of 1899 the number of new disputes reported has been only 680, and the aggregate duration of disputes has been only 2,375,000 days, the lowest totals yet recorded for a similar period. As regards causes, out of a total of 200,769 persons engaged in disputes from all causes, 176,392, or 88 per cent. of the total, were involved in disputes on account of differences as to wages, as compared with 44·1 per cent. in 1897 and 64·9 in 1896.

Proposed Reduction of Wages in Aberdeen.—A meeting of the district branches of the Aberdeen Associated Carpenters and Joiners was held in the Trades Hall last Thursday for the purpose of considering the proposals formulated by the masters with reference to the alterations in the existing rules. The proposals are to the effect that there should be a reduction in the matter of overtime of from time and a half to time and a quarter per hour; that the present rate of wages should be reduced from 8½d. to 8d. per hour; that the excess wages paid to Aberdeen members working in the country should be reduced from 5s. to 4s. per week; and that the regulation allowing notices of changes on the rules to take place only once a year should be changed so that notice of alteration could be given at three months' notice. The meeting, after full discussion, came to the conclusion that the present state of trade did not warrant the alterations which the masters proposed. They considered that whilst the building trade was at present somewhat slack, the prospects did not indicate a continuance of that state of things. They expressed their surprise that the masters should propose to change the rule affecting notices of alterations, seeing that the resolution as now in operation was orginally drafted by them. The meeting decided unanimously to oppose in every detail the masters' demands. The Amalgamated Carpenters and Joiners will meet on an early date to discuss the question.

Dispute Between the Bricklayers and Plasterers.—In our issue for November 22nd we stated that trouble was likely to arise between the Operative Bricklayers' Society and the Plasterers' Society upon the question as to who should have the laying of tiles to hearths. This has now arisen in the case of a small job at Wandsworth—the Nurses' Home. Both societies claimed the work, and if either trade had got it the other would undoubtedly have come out on strike. Alderman Henry Taylor, the representative of the Bricklayers' Society on the London County Council, was deputed to meet Mr. Gregory, a member of the Master Builders' Association, and Mr. Hennessey, of the Plasterers' Society. Mr. Taylor states that, bearing in mind the fact that his own society had just about that time voted by a majority of five to one in favour of the formation of a Conciliation Board to deal with the demarkation of work between trades, Mr. Gregory, Mr. Hennessey and himself agreed that it would be a great mistake to have a dispute over such a small matter as this, which involved a few weeks' work for two men, and they therefore signed a temporary agreement relating only to this particular piece of work, by which the small hearths should be laid by the plasterers and the large ones by the bricklayers, so that neither side gained any advantage. A vote is now being taken by the Bricklayers' Society upon Mr. Taylor's action, and is expected by both him and Mr. Batchelor, the secretary of the Society, to go against him and discontinue at once the payment of the salary which has enabled him to render his own trade and the cause of labour generally such splendid service on the L.C.C. The trouble really has arisen as a result of Mr. Gregory, in justice to Mr. Taylor, writing a letter explaining the position. Mr. Taylor did not give away a principle or a right or decide against his own trade, and he refused to acknowledge that the plasterers had the right to this work. We consider that Mr. Taylor has acted quite rightly, and we only wish that other trades' unions had representatives of such marked ability to do what was best for his trade. His moderation has always caused him to be held in esteem by the masters and the sensible workmen; he did not act as a mere agitator holding always to the opinions of the majority of the members of his society, whether right or wrong, which too often occurs, resulting in the non-recognition of these agitators by the masters as a go-between. We regret the two unions did not come to an arrangement such as we suggested before: that a qualified man of either trade should be allowed to lay tiles to hearths with equal wages paid to either man—these qualified men we prefer to call "tile-fixers," as they require a special knowledge for the work.

Builders' Notes.

The Edinburgh and Leith Master Builders' Association recently held its annual dinner, when the president, Mr James Millar, occupied the chair.

Tenders for New Technical College at Wigan.—The nine original tenders for the erection of the proposed new college buildings in Library Street, Wigan, varied from about £20,000 to £36,000, exclusive of contracts already entered into for terra cotta to the amount of about £5,000 which the successful competitor will include. The selection has not yet been made.

A New Artificial Stone, says Consul Atwell, of Roubaix, three times as strong as freestone, and resembling Cobestang granite in properties, has been tried at Malmes Arsenal. It is unaffected by cold, it absorbs only 6 to 7 per cent. of water, and requires a pressure of 88lbs. on the square centimetre (0.155in.) to crush it. The stone is made at Uccles, near Brussels, and is inexpensive.

Wrexham Improvements.—At the last meeting of the Wrexham Town Council it was decided to purchase a steam fire engine for £380, and the borough surveyor (Mr. J. W. M. Smith) was instructed to prepare a specification, in accordance with his plans (already approved), for the proposed public baths; the work to be partly done by contract and partly by the corporation employees. Application is to be made to the Public Works Loan Commissioners for the advance of £20,000 for electric lighting, £1,800 for public baths, and £2,100 for a refuse destructor.

Leeds Corporation and Fair Contracts.—At the last meeting of the Leeds City Council objection was taken by several members to the letting of a contract to Messrs. J. Schofield, Sons and Co. for the construction of seven electric transformer chambers, at a cost of £2,298, on the ground that the contractor did not pay the standard rate of wages to certain of his men. It was said Mr. Schofield claimed that the men who excavated were not builders' labourers, and therefore not entitled to the higher rate of wages. Since then the Lighting Committee have resolved to again recommend the Council to accept Messrs. Schofield's tender.

Surveying and Sanitary Notes.

Morecambe Sewage.—The first contract for the new sewerage scheme for Morecambe has been let to a Leeds firm for £66,500. The second contract is under consideration.

Street Improvements at Mansfield.—It is proposed to borrow £19,400 for street improvements at Mansfield, and £1,415 for water supply. A Local Government Board inquiry has been held.

Brighouse Sewage Scheme.—Rapid progress has now been made with the Brighouse sewage scheme—the expenditure up to date is £98,766 7s. 8d. Mr. Fowler, the engineer, reports that the tanks at the outfall works are now complete.

The Most Dangerous Crossing in London.—At a recent inquest on the body of a man who had been knocked down by a cab at the corner of the Embankment and New Bridge Street, a juror said the spot was the most dangerous crossing in London. This spot, which has already been condemned as such by three coroners' juries, is sometimes called "Slaughter Corner."

Road Material at 84s. a Ton.—The people of Dayton, Green County, Wis., have, it would appear, been building their roads not wisely but too well. For years they have been using a whitish substance which cropped out of a hill near the village mill. It made excellent roads and had a good appearance, and that was all the villagers thought about it. Now a visitor has disturbed the equanimity of the Dayton folk by the discovery that the white substance is the best quality of silica, and that it is worth from 62s. to 84s. a ton for the manufacture of pottery. The bed from which this silica has been taken is 10ft. thick and is supposed to run back into the hills for fully a mile.

Sanitary Inspectors' Examinations.—At the recent examination for sanitary inspectors under the Public Health (London) Act, 1891, the following candidates passed: Miss M. le F. Boileau and Miss G. E. M. Church, Sanitary Institute; Mr. W. J. Coleman and Mr. A. E. Didier-Garnham, King's College; Miss Julia Hancock, B.A., Miss R. B. W. Holmes, and Miss E. C. Honey, National Health Society; Mr. S. H. Kemp, King's College; Miss M. K. le Lean, Sanitary Institute; Miss D. B. Meeson, Miss F. M. Nicholas, Miss M. W. Richardson, Miss C. F. Stephens, Miss A. E. Turner, and Miss A. M. S. Tweeddale, National Health Society; and Mr. T. D. Young, King's College.

"Water Closets and Their Connections" were dealt with by Mr. Isaac Low in a recent lecture before the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society. In his opening remarks he showed how the subject was of more or less importance to architects and craftsmen. He deprecated the idea that any hole or corner was good enough for a water closet; it should have three of its walls to the outside, although the cost was, of course, always prohibitive to a great extent to the proper sanitation of any building. He traced the evolution of the water closet from the earliest times. It was in evidence considerably earlier than most would imagine. The earliest ideas mostly took the form of a marble basin with the ordinary draw-valve. The idea was good, only the marble being very absorbent rendered such an article unsatisfactory. The evolution of the pan closet, which was similar in idea to that just mentioned, was next described by the lecturer, who afterwards dealt with the hopper closet, which was much used in Edinburgh, and was really the prototype of the present "wash-down" closet, this latter being first brought out in Glasgow. Traps were commented on, and with regard to internal and exposed plumber work the opinion was expressed that the former was quite proper if the tradesman did his work correctly. An interesting discussion followed.

Engineering Notes.

Mr. John Smith, of Keighley, machine and crane maker, died last week at the age of sixty years.

Electric Traction for the London Tramways is proposed to be adopted. The Council are promoting a Bill which entails an expenditure of three millions of money; but not more than £250,000 would be spent before September 30th, 1901.

American Competition.—The Glasgow Corporation have accepted the offer of the National Conduit Cable Company, New York, for electric feeders for the city tramways. The American price was £151,000, or £10,000 under the lowest British offer.

Street Lighting with Acetylene.—An experiment in supplying acetylene gas like coal gas is going on in Tata-Tovaros, Hungary, a town of 12,000 inhabitants. Five miles of piping light 158 street lamps and 250 burners in houses. The generating plant only requires the services of two men; the installation cost about £10,000.

Dublin Electric Lighting.—The Dublin Corporation have adopted a large scheme for extending the electric lighting of the city. It is proposed to establish new plant at the power house, capable of supplying 100,000 lamps of eight-candle power, and 412 new arc lights are to be provided in the streets. The estimated expenditure is £250,000. The works are to be completed in two years.

Proposed Electric Lighting Extensions in Aberdeen.—To meet the increased demand for electrical energy in Aberdeen, it is contemplated to extend the plant and buildings. The engineer, Mr. Bell, reports favourably of a site in Dee Village for a new station. The ground would be sufficient for the installation of at least 10,000 h.p. of engines and boilers. In the meantime, to meet the needs of the winter of 1900, he recommends that an additional 700 h.p. engine and dynamo should be installed in the existing engine room at the Cotton Street works.

An Ingenious Lighting Scheme.—One of the most interesting long-distance transmission plants that has yet been constructed is that for the lighting of the city of Los Angelos, and running a railway, from power generated at the San Gabriel Waterfall, in California. So many novel combinations were forced upon the designing and constructing engineers at every step, says "Engineering," that the whole installation presents a constant series of surprises. The San Gabriel River, although filled from bank to bank, 400ft. apart, in the rainy season, is marked during the long summer months of cloudless sky by dry bleached gravel, with a narrow stream meandering near the centre. A few inches below the surface of this so-called "dry" river, moisture is found, and by digging a few feet ample water appears. The intake of the water to the tunnels for transmission to the turbines presents a novel feature, for after passing the strainerbars and headgates the water makes a perpendicular drop of 20ft., whence it continues horizontally through a tunnel, the first of a series of thirty-eight tunnels in the waterway. This drop of 20ft. is provided to divert into the tunnel, during the summer season, the underflow that filters through the sand and gravel beneath the river bed. To secure this underflow permanently a submerged dam is being built across the bed of the river immediately below the intake, which will effectually catch the entire stream. The water is conveyed a distance of six miles. The average gradient of the waterway is 5ft. per mile. At the power station four double sets of waterwheels are used. The electrical equipment includes four Westinghouse generators, 300 kilowatts each, two-phase, 500 to 550 volts, with a normal speed of 450 revolutions per minute. The line from Azusa to Los Angelos is twenty-three miles in length, and six conductors for the electricity are provided, the results being most satisfactory.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
		BUILDING—		
Jan.	5	Linthwaite, Huddersfield—Houses	Industrial Co-operative Society, Ltd.	J. Berry, 9, Queen-street, Huddersfield.
,,	5	Whitley, Northumberland—Council Offices, Fire Brigade House and Stores.	Urban District Council	J. P. Spencer, 13, Grainger-st. West, Newcastle-on-Tyne.
,,	6	Swindon—Hospital Buildings	District Hospital Board	Halliday and Rodger, 14, High-street, Cardiff.
,,	6	Birmingham—Alterations to Coachman's House	Guardians	W. H. Ward, Paradise-street, Birmingham.
,,	8	Eastbourne—Bandstand	Pleasure Grounds Committee	R. M. Gloyne, Borough Engineer, Town Hall.
,,	8	Oswestry—Market Extension	Town Council	E. W. Lacey, Borough Engineer, Guildhall, Oswestry.
,,	8	Blaentylery, Mon.—School	Aberystruth School Board	R. L. Roberts, Victoria-chambers, Abercarn.

Auctioneers' Offices, 51, Cheapside, E.C., and 140, Kensington High-street, W.

PROGRAMME of EDUCATIONAL WORK
to be carried on by the
WORSHIPFUL COMPANY OF CARPENTERS
During 1900.

FEBRUARY and MARCH	Weekly Lectures in the Great Hall, London Wall.
MAY and JUNE	Lectures to Clerks of Works, Shop and Outdoor Foremen in Carpentry and Joinery for Candidates for the Examination to be held in latter part of June.
OCTOBER and NOVEMBER	Lectures to Candidates entering for Examination in Building and Sanitary Construction to be held towards the end of the year.

UNIVERSITY COLLEGE.

Evening Lectures and Drawing Classes during the year, commencing JANUARY 22nd. Instruction in Building Construction, Architecture, and in Architectural Drawing.

KING'S COLLEGE.

Evening Lectures, Constructional and Geometrical Drawing Classes, Quantity Class, and Architectural Studio during the year, commencing JANUARY 12th.

The Reference Museum open to Students as before.

Wood Carving for Amateurs.

Day and Evening Classes during the year, commencing JANUARY 15th.

GREAT TITCHFIELD-STREET.
(For the Trade only).

The following Classes recommenced on NOVEMBER 27th for Carpenters and Joiners, Handrailing, Tylers, and Bricklayers, Painter Stainers, Wheelwrights, Plasterers, Masons, Plumbers, Smiths, Stone Carvers and Wood Carvers, and continued during the year.

STRATFORD INSTITUTE.

Organised Science Day School.	Subjects taught: Mathematics, Machine Construction and Drawing, Building Construction, Geometry, Chemistry, Freehand and Model Drawing, and Workshop Instruction.

There are also Trade Classes held in the evenings.

CARPENTERS' HALL.

A Free Lending and Reference Library for Books relating to Carpentry, Building or Sanitary matters is open as usual.

For further particulars apply to
STANTON WM. PRESTON.
Carpenters' Hall,
London Wall. 1

CITY and GUILDS TECHNICAL
COLLEGE, Finsbury,
Leonard-street, City-road, E.C.
APPLIED ART DEPARTMENT.

The Classes are open to all Art Workers, and are under the direction of the Headmaster of the Department, Mr. A. F. BROPHY, assisted by a qualified staff of Technical Art Experts.

Drawing, Design and its application to Special Industries, Internal Decoration, Furniture, Gold and Silversmith's Work, Carving, Engraving, Illustrating, &c.

Technical Painting.

Painting from Life Model.

Modelling in Clay and Wax from Casts and Life, Enamelling on Copper, Silver and Gold.

The principal Studios are lighted by electricity, and are open every EVENING of the week, except SATURDAY, from 7 to 9.30.

Next Term begins on MONDAY, JANUARY 8th, 1900, and ends on FRIDAY, JUNE 22nd, 1900. Fees, three nights a week, 10s.; five nights a week, 15s. Apprentices, under twenty years of age, are admitted at half fees.

Programmes giving full particulars of the Courses may be obtained at the College, Leonard-street, E.C.; or at the Head Office of the City and Guilds of London Institute, Gresham College, Basinghall-street, E.C. 1

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum

MODELS.
For Exhibitions or Law Cases.
Illustrations sent of Work Executed.
JOHN B. THORP, 98, Gray's Inn-road, W.C.

R.I.B.A., Society of Architects, and Civil Service Technical Examinations. Personal, correspondence, or resident preparation. Seventeen first places.—MIDDLETON and CARDEN, Associates R.I.B.A., 19, Craven-street, W.C.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A.,
ASSISTS in the
PREPARATION of DRAWINGS, TRACINGS, &c.,
at his own Office.
G. SCORER, 28, Newman-street, W.

QUANTITIES PREPARED, SPECIFICATIONS WRITTEN, &c., by Experienced London Surveyor; full responsibility taken; terms by mutual arrangement.—Box 1,212, BUILDERS' JOURNAL Office. 14

ABLE ASSISTANCE.
WORKING and DETAIL DRAWINGS,
DESIGNS, PERSPECTIVES, TRACINGS.
QUANTITIES and SPECIFICATIONS,
DIFFICULTIES of PRACTICE advised upon.
F. BRENT, 34, Great James-street, W.C. 27

DEVELOPMENT of ESTATES.—A qualified, artistic, practical ARCHITECT SURVEYOR, just completed estate, offers SERVICES, wholly, partially, similar work. Would take entire charge. Long experience; highest references. Town office.—ZETA, care of Point House, Lewisham, S.E. 3

A QUALIFIED and Experienced Building Surveyor UNDERTAKES Quantity Work, Variations, Specifications, &c. Advice on Drainage, New Buildings, and Alterations. Vacancies for "Correspondence" Students.—CLARE, BUILDERS' JOURNAL Office. 3

APPOINTMENTS VACANT.

JUNIOR ASSISTANT or Youth REQUIRED in an Architect and Surveyor's office in South London. — State age, qualifications, and salary required to "M. S. A.," 41, Barry-road, Dulwich, S.E. 1

TELEGRAMS: Dividitore London." **LONDON** TELEPHONE: No. 1011 Holborn.

Arundel Street,
Strand, W.C.

An Architectural Causerie.

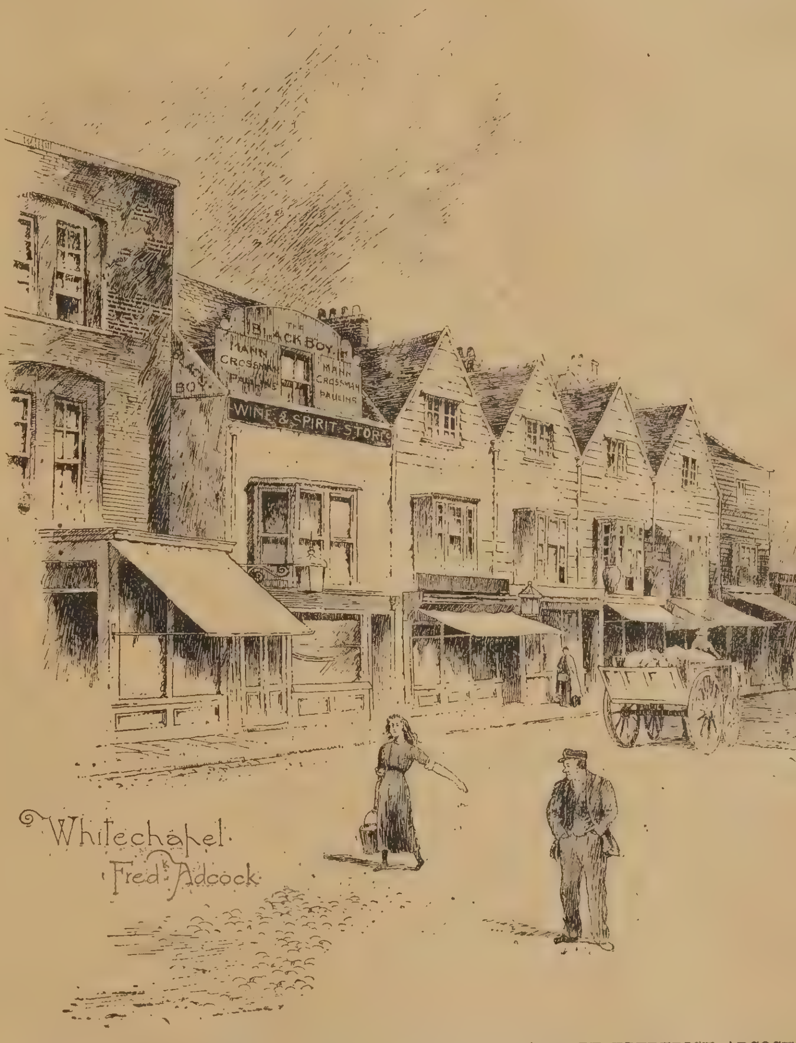
Alas, Poor "Ghosts!" There are few circumstances which mark the practice of architecture during the past quarter of a century more strongly than the decay of the once respectable class of which I claim to have been a not insignificant member—a decay so steady and persistent as to lead, I fear, to complete extinction. An elderly ghost, whose long and honourable career of usefulness has closed, may be excused if, from his well-earned retirement, he turns his thoughts fondly backwards to the doings of the happy band to which he once belonged. In the days of his prosperity he was, and felt himself to be, a power in the land. The open repudiation and the private adulation of which he was the object brought with it an air of mystery which was flattering to his vanity. He enjoyed the excitement of a conspirator, whilst he at the same time ran no risk. His remuneration was, perhaps, partly contingent upon success, but, at the worst, it was in excess of the normal rate, and he was always indemnified against loss. His patrons were civil and considerate—often liberal—partly, perhaps, because the disclosure of his identity would have been inconvenient. Amongst the select society of the brethren he enjoyed the stimulus and reward of fame.

The existence of the ghost, and facilities for enlisting his ability, encouraged the growth of a kind of architect who had all the requisites for success except a knowledge of architecture. Educated, glib, well connected, and possessed of "means," he had the keen scent which tracked out a promising job, and the skill to win over the committee or other movers in the project. He took the necessary pains to ascertain the requirements, and discover the sort of thing which would be most likely to go down with the projectors. These preliminaries being settled, the rest of the business devolved upon the ghost. He it was who, in dingy chambers through long days and nights, worked up the roughest of ideas. Under his rapid and skilful hand the formless thing took shape. All styles were alike to him, and as a draughtsman he was, of course, *facile princeps.* He was, as an artist, really interested in the design, in which he secretly felt a paternal pride, and the perspectives upon which, as he knew, the final triumph mainly depended, blazed out in all the bravery of the entire resources of the colour box. Seldom or never did the suspicion of the existence of the ghost get abroad. Idle rumours could be denied or explained away. The ghost, too, "felt his part," and acted up to it. Moreover, the report and estimate were in the architect's *own handwriting!* What cathedrals, mansions, schools, adorn the land which owe their being to Ghostly Fathers! But the leading virtue of a ghost who respected himself and his profession was silence. So loyal and discreet have this honourable body shown themselves, that many buildings of acknowledged excellence are *known* to be the work of ghosts, but of what particular ghost no one has been able to discover. The ghost was so impressed with the responsibilities of his unique position, that there were things he never revealed even to his brother spirits. He "chortled" the more, and descended to the shades with his secret intact.

But all is changed, and I, a lonely superannuated member of that once flourishing body, wander to and fro companionless. A change for the worse has come over our patron. It is now thought that he should be in very deed what he is in name. Priggish societies, with long names, have taken him in hand, and now teach him his business. Life for him is earnest. He dresses like an ordinary professional, and actually gives himself the trouble to qualify for practice.

The beautiful superstition which hung around the art of drawing in perspective—and which the various learned treatises (with a sly humour) contrived to mystify—has long since been rudely dispelled. Each one now makes his own designs, and, as to perspectives (or the scratchy things which do duty for our beautiful pictures), he finds no more difficulty in them than in copying the five orders from Chambers or Gibbs. As a Cook's tourist, or on wheels, he courses all over Europe and brings back sketches which thirty years ago would have won him reputation as a prodigy. He is quick to hit the passing taste, and ready with both pen and pencil. What a ghost he would have made! But by his inconsiderate efficiency he has left no room for that obsolete and discredited artist. Alas, poor ghost! It is said that even the painter's ghost has gone out, and that our modern Raphaels and Reynoldses "do" their own hands and draperies; and, although it is whispered that suspicious figures still haunt our sculptor's studios, I have never met a brother who admitted that he was connected with that branch of art.

The poor remnant that survives is not sufficiently numerous to form a club where we might meet, and—with due reserve and the sanction of appropriate rights—recount the brave doings of our prime. Disclosure by other means is, of course, out of the question. Each could "a tale unfold," but the "eternal blazon" must not be, for no ghost would so far forget himself and so bring discredit upon an honourable, but, alas! fast dwindling body—if the term may be allowed. For the same reason this lament must remain unsigned, for it must be obvious to all readers that it is of the essence of a real ghost to be OCCULT.



OLD HOUSES IN WHITECHAPEL ROAD, LONDON. DRAWN BY FREDERICK ADCOCK.

Old Houses at Whitechapel. There are still to be found in various parts of the East End many exceedingly curious and interesting remains of Old London. Not the least attractive of these are the ancient wooden houses that stand a little way down on the north side of the Whitechapel Road. Their chief charm, perhaps, lies in their antiquity, and certainly something of their artistic effect is owing to the squalor and general ugliness of their surroundings; at the same time, as will be seen by the illustration on this page (which is from a drawing by Mr. Frederick Adcock), they have a quaint picturesqueness that is peculiarly their own.

The Abuse of Plate Glass. In this age of silent revolutions changes are effected in the appearance of towns with a sort of stealthy swiftness unknown in previous ages. When plate glass was introduced it was looked upon as a small but perceptible modern improvement, suitable to a country where light is not too plentiful; but within the last year or two its adoption has been so rapid that it is actually bringing about a vast change in the appearance of London streets. It has been rendered possible by the great development of steel and iron construction, and in every direction we see the lowest storey, popularly called the "ground floor," being removed bodily, and an immense sheet of plate glass substituted for it. Where once was masonry there is now a light transparent material; above it rises floor upon floor of ordinary heavy bricks or stone, and as the system extends we find entire streets of houses resting upon air; at a little distance the effect is most singular. Nor is it confined to the ground floor: every here and there the next storey is being treated in similar fashion, though sometimes the change is limited a little by confining the glass within a large round arch. The removal of masonry, however, is almost as great, and the building, in the hitherto accepted sense of the word, disappears. How far will it be carried? The question is interesting, and will shortly assume great importance. Already we see Jacobean gables and a red-brick storey or two rising over an unreal-looking structure, apparently of glass, though actually held together by a strong framework of steel. Will walls gradually disappear, and finally even the gables, London being transformed into a city of glass and iron? About this change there is one singular and inexplicable feature. The object of introducing vast sheets of glass was to admit more light. But most of the shops thus treated are very dark, for the front is completely occupied and the light blocked by a mass of goods, scores of gloves, dozens of shirts, and, most nauseating to the eye, in the restaurants, a mass of eatables, enough to take away any man's appetite. The interior of refreshment rooms, bars, "lounges," and similar places feels the effect of the age of glass in a want of snugness and a sense of cold magnificence; the glass being often associated with other hard, glossy, icy materials; one loses the friendly comfort of surrounding walls, giving privacy and excluding the sense of cold. Even on a smaller scale than this, where plate glass has been used for large windows well placed in solid and handsome masonry, the effect is that of a succession of large holes. There are few modern buildings of a nobler appearance than the National Provincial Bank in Bishopsgate Street, few indeed to equal it; but the lofty windows require something to break up their vast expanse of black nothingness given by gigantic sheets of glass; light in our climate is important, no doubt, but there is no need to exaggerate its importance, and the present use of plate glass is either an abuse or it portends a revolution, and one without much justification, in the whole art and craft of architecture. It is satisfactory to note an occasional protest against this tendency and several large hotels and some other buildings in the best quarter of London have deliberately adopted smaller panes, some with lattice or other leading. But whether they will be able to stem the tide remains to be seen. J. C. P.

On Reflection.

Co-operative Building. A well-known American architect, Mr. J. Pickering Putnam, has been advocating a scheme for erecting dwellings by co-operative effort on the part of skilled workmen. Mr. Putnam's plan has some novel features, but before considering the details of any individual plan the preliminary question—whether co-operation in any form is a thing to be encouraged—has first to be decided. We cannot expect that the contractor will regard experiments of this sort with enthusiasm; the general and successful adoption of co-operative principles would mean the elimination of himself and his class, though he may feel reassured to know that such a contingency is a very remote one—at any rate in this country, where the building trade has hitherto been but little influenced by the co-operative movement. From the point of view, however, of the architect, the workman, and the public, there is much to be said in favour of these schemes. Men engaged in the production of buildings which will be their own property would have an incentive to industry altogether lacking under the existing system; mutual helpfulness, instead of antagonism and suspicion between members of different trades, would be the rule, and the architect would find pleasant relations with the workmen facilitated by the existence of a common aim—the expeditious and satisfactory completion of the job on hand—while the public would gain by an improvement in the character of the buildings. If the restoration in the twentieth century of the noble craftsmanship of the mediæval builders is a thing at all possible, it will only be, we think, by a wide development of the co-operative idea. One thing, however, needs to be remembered: co-operation, to be successful, demands workmen of the highest type. The average workmen of to-day would prove, we fear, a failure in co-operative building, unless, indeed, he were inspired by ideals and principles very different from those which seem to commend themselves to many of our trade unions.

Craftsmen for Australia. It is a great day in the life of a nation when it discerns that there are other things to live for than to eat, sleep, and fight; here is the starting point of civilisation. But it is a long time before the old passions are subdued (they are never eliminated altogether) and the higher branches of industry and of art are able to exercise any potent sway over the mind of the community. As a glance at history will show, this influence fluctuates greatly—is sometimes strong, sometimes weak, at one time inventive and full of grace, at another dull and imitative; but the effects of good work can never be entirely lost, just as we feel to this day the ennobling elements in the writings of the old Greek poets, or in the paintings of the Italian masters. To come to present times, we may take Australia, and a letter from a leading architect in Sydney (published in the R.I.B.A. journal) as an example. When the British first colonised in this vast country they necessarily built themselves houses, and then began to practise agriculture and farming, and to dig in the earth. With the discovery of gold came a great influx of wealth-seekers and adventurers, but after the first shock had quieted down and routine took the place of excited impulse, some of the gentler arts began to be felt, and are really just beginning to have force. In the letter referred to above it is said: "We are at a loss out here for good art workmen of all kinds. There are plenty of third-rate men, but there is only one highly-skilled worker in metal. There is a good opening in all branches for workers in wood, iron, stone and metal; also for stained glass workers, modellers, and designers in plastic materials, decorative painters, and men skilled in the working of marble and mosaic. Young men with a small capital, but with artistic capacity, would be the most suitable. If without capital, they could readily get employment here at good rates of pay. The one essential is that they shall be good men. Of course, good men can always find employment 'at home.' But as there may be many with incipient lung or chest complaints, bronchitis or affections of the throat, this climate could not fail to be of great benefit to them. For general information as to the colony, our Agent-General, Sir Julian Salomons, will, I am sure, if applied to, furnish all that is required." This states the case very plainly, and those of our readers who have a desire to respond to the invitation are given all the information that is necessary to test themselves by, which really amounts to their being "good men." Unhappily, young fellows often emigrate to one or other of our colonies in a very haphazard fashion; they seem to think that they will soon be able to secure an appointment when they arrive, but often find out to their cost that this is not so easy. Before deciding on a matter of this kind, which may have life-long results, it ought always to be a primary consideration to ascertain first the need for, and then the fitness of, new additions to trades and professions, for it is quite possible that these may be as full in the colonies as they are here.

Noisy Streets. The question of repressing street noises is one that has now been discussed for some considerable time, though apparently with little effect, but it has lately received renewed attention by a circular issued under the auspices of the Society for the Suppression of Street Nuisances, a society whose existence is perhaps known to but very few. All noise is comparative; that is, what to one man seems loud and harsh may have little effect on another who has become accustomed to such intense sounds. By some London is considered to be very noisy, but many New Yorkers find it quiet in comparison with their own city. The three sources of noise whose abolition is desired are, street musicians, newsvendors, and railway whistles. A great diversity of opinion exists in regard to this matter, which is no doubt the reason why there has been so much talk and so little action. Take, for instance, street musicians. Now, while the alien band or the vocal starveling is certainly obnoxious (that is, speaking generally), many piano organs are pleasing to hear. The raucous newsvendor is indeed a nuisance, and it were well that his calling were prohibited and that other employment found for him. Railway whistles are an abomination, and, to replace them, a system of wireless telegraphy between engine drivers, guards, and other officials is about to be tried in Italy; this may possible prove one means of mitigating the nuisance. It has often been stated that harsh, discordant sounds, whether we have become so accustomed to them that they are hardly heard or not, do wear and injure the nerves, and, consequently, the brain. This argument has no doubt often been carried too far, but there is much truth in it. A great advance has been made in the matter of the suppression of street noises by the substitution of wood and asphalt for the old cobbles, and by the employment of rubber-tyred vehicles, but there is still a great deal more to do, and, as their aim is to begin to ameliorate our surroundings by actual work, the Society for the Suppression of Street Nuisances certainly deserves support from all those who know what it is to live in a town or city where one disagreeable din is a prominent feature in the day's life.

ELTHAM PALACE.

BY C. G. HARPER.

THE sale of the Crown lease of the old Court Lodge at Eltham, and of the ruins of the ancient Royal Palace, which stands within the extensive grounds, gives a renewed interest to an historic relic which, less than ten miles from London and situated within easy reach of such populous suburbs as those of Greenwich, Lee, and Blackheath, is yet little known either to the lay public or the architectural student. Eltham yet keeps its old village character, and the beautiful, elm-shaded road that leads from it to the railway station is still old-world, despite the handsome villas recently erected on the Crown lands here. The Crown, indeed, has a tight grip over this neighbourhood, and one of the many minor and generally unheard-of titles of the Prince of Wales is "Baron Eltham." Even back in the dim records of Saxon times the manor belonged to the Crown. After the Conquest it was given by William to his half-brother, Odo, Bishop of Bayeux, but was confiscated by William Redbeard and conferred upon the Magnavilles, Earls of Essex. From that time onward a kaleidoscopic succession of owners held the lands here, but they always reverted to the Crown again, and so they remained from the time when Anthony Beke, Bishop of Durham, made them over in 1310 to Edward the Third until the troublous days of Charles the First, when the Parliamentary Commissioners under Cromwell seized the Palace and parks and sold them to the highest bidders. Even then the see-saw of history had not done with Eltham, for Charles the Second resumed the property upon the occasion of what an old chronicler calls his "glorious and never-to-be-forgotten Restoracion." But that was the ultimate change of ownership, and with the Crown it has ever since remained.

ENTRANCE TO SUBTERRANEAN PASSAGE FROM THE MOAT. DRAWN BY C. G. HARPER.

History is uncertain about the extent and style of the buildings that existed here before those whose ruins we see to-day. That they were extensive and of a palatial character may be judged from the records that relate how the Prince-Bishop of Durham spent large sums upon the works at the beginning of the fourteenth century; and from the fact that when the bishop died in 1310 the King made "Eltham Palace" a favourite residence. His son, "John of Eltham," was born here five years later, and Edward's former prisoner, King John of France, was entertained here with great splendour. From either of these last two facts the popular name of "King John's Palace" given to the ruins may derive. Certain, however, it is that, whatever the popular voice may do, history does not couple the name of our King John with the place.

BRIDGE ACROSS THE MOAT. DRAWN BY C. G. HARPER.

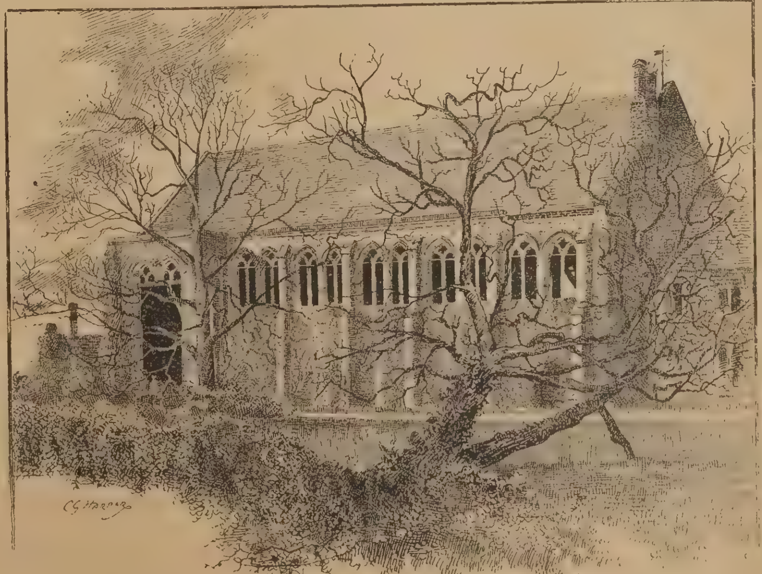
Edward the Third, then, was the first to make this a royal residence. Many State functions were held here in his reign, and Parliament assembled twice under the long vanished roofs, which also sheltered Richard the Second, and the Fourth, Fifth, and Sixth Henrys. With Edward the Fourth the palace was rebuilt, and the existing ruins are chiefly of his period. His badge, the "rose en soleil," may yet be seen carved on the spandrels of the doorway to the Court Lodge.

After having been the scene of great festivities in the reign of Edward the Fourth, when the Christmas of 1482 was kept up here on a scale of unparalleled magnificence, two thousand persons being entertained every day at the royal expense, Eltham began to lose favour. It is true that the Princess Bridget was born here, and that Henry the Seventh frequently made the Palace his home, but Henry the Eighth had no great liking for it. According to an old writer, "This house, by reason of the nearness to Greenwich, hath not been so greatly esteemed, the rather also that the pleasures of the emparked groundes here may be in manner as well enjoyed, the Court lying at Greenwich, as if it were at this house itselfe." So from this time forth the Palace seems to have fallen upon evil days. James the First was the last sovereign to reside at it.

A very potent reason for the old Palace being so little known is that its ruins stand in private grounds. Placed in a retiring position at the end of a lane, which branches off from the high road and leads nowhere else, it is not to be supposed that this old-world spot could readily be discovered by the chance wayfarer, nor are many prepared to ask permission to explore the ruins; although it may here be hinted that the presentation of a visiting card generally wins a courteous permit. Following the course of the winding lane, enclosed on one side by an old wall of red brick, beautiful in its mellow tints and vivid and velvety lichens, one comes to a cluster of old cottages, whose queer boarded fronts, low doorways, and quaint latticed windows make almost irresistible demands upon the sketch book. Passing these, however, for the yet finer feast in store, the roadway leads up to and over an ancient Gothic stone bridge of three arches time-worn and delightfully patched with red brick, old itself in degree. This spans the moat, still partly filled with water. Here the first glimpse is obtained of the venerable banqueting hall, which is the finest remaining feature of the palace, and with a sight of this the pilgrim who may feel inclined to visit the spot will know that no disappointment awaits him.

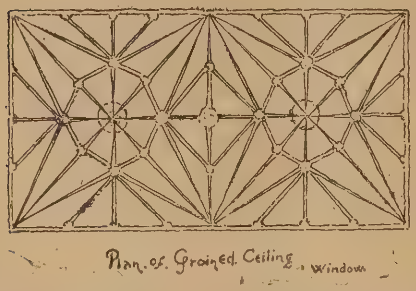
Previous to the extensive rebuilding under the direction of Edward the Fourth, Eltham was a castellated residence, but when this remodelling took place its defensive character was changed for one of a more refined and almost purely domestic sort. Men, of whatever their station, wanted homes to dwell in rather than fortresses. Even such personages as kings, hedged around with snares, treacheries, and dangers above the common lot, gave hostages to fortune in this manner and were content no longer to live in crypt-like cells, unlit save by arrow-slits or exiguous Norman peep-holes, or First Pointed lancets. Hence, among other signs and portents, this substantial stone bridge in place of a drawbridge; and hence, above all other things, the spacious, graceful, and well-lighted banqueting hall. This noble structure measures 100ft. in length,

ELTHAM HOUSE. DRAWN BY C. G. HARPER.

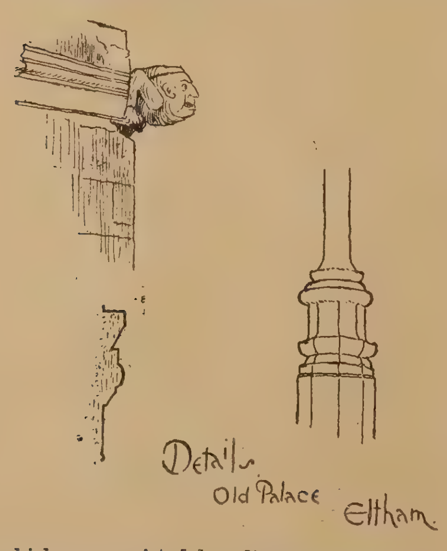


THE BANQUETING HALL. DRAWN BY C. G. HARPER.

56ft. in breadth, and is 60ft. in height. It is technically a neat and masterly example of the builder's art, quite apart from the strictly architectural point of view. The walls consist of a core of red-brick, faced internally with plaster, and externally with fine ashlar, jointed with the greatest nicety. This grand structure is lit from either side by a row of coupled windows, each couple separated by a buttress in two stages and of moderate projection, terminating just below the cornice. Each window is divided by a mullion, and is cinquefoil headed, the cusps being greatly decayed. Some of these windows on the north side are bricked up. At the western end of the Hall, on the north and south sides respectively, are two shallow projections containing windows of great beauty, reaching almost from floor to cornice, originally with a great central mullion and an embattled transom midway. These projecting bays still keep their exquisitely grained ceilings. The cornice is decorated with many gargoyles of an engaging hideousness and in excellent preservation.



The interior is now shorn of all its tapestries and other decorations, but the much-mutilated fragments of the once handsome carved oak minstrels' gallery at the eastern end remains to testify to the sumptuous nature of the former appointments. Enough survives to show that this woodwork is contemporary with the hall, the supporting shafts exhibiting the detail seen in the graceful shafts of the two bays just referred to. It is by the merest chance that the building is not a roofless wreck. At the beginning of the century it did duty as a barn, until the growing appreciation of Gothic drew attention to it, and to its beautiful and massive open hammer-beam chestnut roof, and brought a new danger into existence, a proposal having been made to remove the roof to Windsor Castle. A louvre which once existed has disappeared, the disposition of the woodwork alone proving its existence at one time.



Built on to the east of the Hall is the Court Lodge of Henry the Eighth's time. This is a picturesque, timbered three-gabled elevation retaining its original pierced barge-boards. From beneath the well-kept lawn an underground passage, suggesting dark secrets and romantic incidents of bygone days, winds its dim way to the moat and opens in the wall just above the former level of the water.

PRACTICAL NOTES ON HERALDRY.

By GUY CADOGAN ROTHERY.

I.—INTRODUCTORY.

HERALDRY, properly and judiciously treated, is decidedly effective in architectural and all other forms of decoration. But in spite of the once important part that this science played in social economy, it is curious to see how constantly its meaning is misunderstood and its laws violated by modern artists and decorators. It is therefore worth while to briefly sketch out an historical and practical guide for designers and those who work with brush or chisel, or even the needle. Heraldry is often the most appropriate and the most pleasing of ornamentation; but if it is used, it should not be misrepresented, as we only too often see is the case, both in artistic and merely commercial work.

The origin of heraldry has long been a matter of controversy. The adoption of tribal, national and personal lodges certainly began in prehistoric times; at all events we find traces of such a custom in the rude remains of forgotten races. Hence some writers trace the origin of heraldry very far back indeed. As a matter of fact, however, heraldry only became an art when laws were laid down for its guidance and when symbols adopted were recognised as hereditary. It seems certain that this did not come about until the eleventh or twelfth centuries, when nobles fought in armour and each led his particular body of retainers into the field. The Emperor Frederick Barbarossa is believed by some to be the real father of the art. At first nobles were allowed to do much as they listed in the matter of adopting coat-armour. In England, although two heralds, Norroy and Surroy, were nominated by Edward I., and Clarencieux by Henry IV. in 1411, it was not until the reign of Henry V. that proclamation was made forbidding anyone to assume armorial bearings without permission from the King or his heralds. Heralds' visitations, to enforce this order, were instituted. During these visitations the heralds went round from town to town, summoning all knights, esquires and gentlemen to appear and register their arms, and marriages, births and other events. These visitations took place at irregular periods and lasted for about eighteen months to two years. Henry V. was a great patron of heraldry: he instituted the office of Garter King of Arms, and, as his pursuivant, Blue Mantle. It was also during his reign that coat-armour became regularly hereditary and descended from father to son, the eldest alone wearing the shield as his father did before him; the younger ones had to make some difference, such as adding a border, or using the marks of cadency. The oldest coats-of-arms are generally very plain and have but few charges besides the Ordinaries, for it was the common practice of the younger branches of a family to add other charges, alter the outline and colours of charges, and assume borders of different descriptions to their paternal arms, instead of using the marks of cadency.

Sir James Lawrence, speaking of heraldry and nobility, in his "Nobility of the British Gentry," thus explains the original use of, and the usual way of obtaining, armorial bearings: "Any individual who distinguished himself may be said to ennoble himself. A prince judging an individual worthy of notice gave him patent letters of nobility. In these letters were emblazoned the arms that were to distinguish his shield. By this shield he was to be known or *nobilis*. A plebian had no blazonry on his shield because he was *ignobilis*, or unworthy of notice. Hence arms are the criterion of nobility. Whoever has a shield of arms is a nobleman. In every country of Europe, without exception, a grant of arms, or letters patent of nobility, is conferred on all the descendants." Thus it will be seen that the essential part of heraldry was the hereditary character of coat-armour. It may be as well to explain that the appellation of *coat* of arms originated from the practice of embroidering the family insignia on the surcoats, a garment worn over the armour or shirt of mail; these surcoats in later times were used only by heralds, by whom they are still worn when on official duties, and by pages and menials of princely or noble houses.

From the arms of the head of the State to arms of concession there are altogether ten degrees: First, arms of dominion, or national armorial bearings borne by sovereigns. Secondly, we have arms of pretension, or armorial bearings, adopted by sovereigns of kingdoms or provinces over which they are actually reigning. (If a man marries an heiress he is entitled to wear her arms in an escutcheon of pretence, placed over his own, but this properly belongs to the eighth degree.) Thirdly, arms of community, such as the arms of bishops' sees, of towns, universities, colleges and corporate bodies. Fourthly, arms of patronage, which are arms of community worn by the occupants of various offices of responsibility and dignity. Fifthly, arms of succession; arms borne by the inheritors of fifes, manors, either by will or donation. Sixthly, arms of assumption. Seventhly, paternal arms; the arms descending from father to son. Eighthly, arms of alliance; arms quartered by the descendants of an heiress in order to show their descent. Ninthly, arms of adoptions, borne by strangers in blood in accordance with the wishes laid down by will or other legal mode of donation, or arms borne by an adopted child, of the original bearer; but before adoption express permission must be obtained from the sovereign. And tenthly, arms of concession; armorial bearings, parts of armorial bearings, or special charges given by a sovereign to a subject.

There are three principal divisions of heraldry—the field, the tinctures and the charges.

The field is the ground of the shield or banner, and for the better descriptions of armorial bearings the shield has been divided into the upper portion, known as the chief point; the middle, known as the fesse; and the lower called the base; and is further divided into dexter and sinister sides.

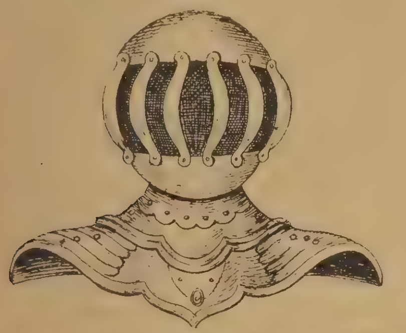
In describing a shield, the tincture of the field should be first mentioned. A shield may be party-coloured. For instance, a shield divided down the middle by a perpendicular line, the left side green and the right red, would be described thus: Party per pale gule and vert. The term *proper*, when used in reference to the tincture of a charge, shows that it is of its natural colour. Thus, a green tree with a brown trunk is a "tree proper." Roses cannot be emblazoned *proper*, as they may be either red or white; but a "rose proper, gule," or a "rose proper, argent," is a perfectly correct blazoning, for it shows that the roses are the botanical flower and not the heraldic one. When an escutcheon is described as having three charges of the same kind, it is always to be understood that they are borne two above and one below, unless specially mentioned as being borne *in pale*, *in fesse*, or *in bend*.

In heraldry there are two metals and five ordinary colours. In engravings of coats-of-arms each colour is represented by differently-arranged lines. Some authorities assign this invention to Colombière, others to Silvestro di Pietrasanta, about the seventeenth century.

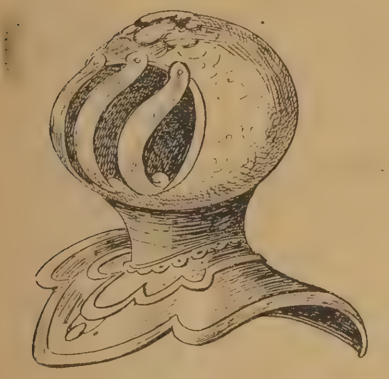
Or, gold, is represented by dots; *argent*, silver, by a plain surface; *gules*, red, by perpendicular lines; *azure*, blue, by horizontal lines; *sable*, black, by perpendicular and horizontal lines crossing each other; *vert*, green, by lines from dexter chief to sinister base; and *purpure*, purple, by lines from sinister chief to dexter base. Besides these five ordinary tinctures, there are two more mentioned by heralds, although they are but seldom used. They are *sanguine*, sometimes called *murrey*, a deep red to represent the colour of blood, which is represented in engravings by lines from dexter chief to sinister base, crossed by lines from sinister chief to dexter base; and *tenny*, or *orange*, by lines from sinister chief to dexter base crossed by horizontal lines.

Gules is considered the most honourable tincture, no doubt because it represented the blood lost on the battlefield in the service of one's king. Ermine ranks first among the furs on account of its having been originally restricted to the crowned heads and their nobles and afterwards extended to judges and other high law officials. Count de Gobelins states that the heraldic colours derive their names from the Arabic. Other writers argue that *gules* comes from the French *gueule*, the mouth of a wild beast, which is generally red.

The furs are *ermine*, white with black spots, and its three modifications—*ermines*, black with silver spots; *erminetes*, white with black spots and a red hair on each side of the spots; *erminois*, gold with black spots; and *pean*, black with gold spots. *Vair* is represented by blue and white shields or glasses in horizontal rows, the bases of the white resting on the bases of the blue. This fur has also one modification, which is termed *counter vair*, in which the glasses of one colour are placed base to base. *Vair* is always emblazoned argent and azure, and *counter vair* or and azure. *Potent* is represented by crutch-shaped charges; it is emblazoned argent and azure, the base of one colour being placed on the base of one of metal; and its modification *potent-counter-potent*, sometimes termed *vairy-cuppy*, which is of the same tinctures as *potent* but the crutched-shaped charges of one colour, have their bases placed against the bases of one of the same colour.



ROYAL HELMET.



PEER'S HELMET.

During the seventeenth century the heralds in England, in order to give more dignity, as they thought, to the science, used the names of jewels instead of the metals and tinctures when emblazoning the shields of peers and peeresses. The only use of this system appears to have been to make heraldry all the more puzzling and difficult of comprehension to the non-initiated. Silver was replaced by pearls or crystal, gold by topazes, gules by rubies, azures by sapphires, sable by diamonds, vert by emeralds, and purpure by amethysts. Furs, of course, retained their usual names. Princely insignia were emblazoned with the names of planets and heavenly bodies. The Sun represented gold; the Moon, silver; Mars, gule; Jupiter, azure; Saturn, sable; Venus, green; Mercury, purpure; or by their symbols, ☉, ☽, ♂, ♃, ♄, ♀, ☿. Such was one of the ways that heralds adopted to try and give increased importance to the science, while they only helped to entangle it in senseless, and, therefore, worse than useless additions.

Heralds also invented a long list of abatements (marks of disgrace), such as the *gores* and *gussets*; Guillim affirming these two to be objects used by "Semsters," and, therefore, appropriate to denote cowardice, which seems to be a rather hard charge against the poor sempstresses. A man who recanted his challenge to combat was assigned a "*delftennée.*" The only abatement that was extensively used and acknowledged by heralds of all countries was the *scarpe* or *baton*, the abatement assigned in cases of bastardy, and one which has popularly the misleading term of bastard-bar.

The general prevalence of lions and fleur-de-lis in armorial bearings of early date was caused by augmentations made by kings to their favourites and those who had distinguished themselves in battle or in council. It is only in the later periods that heraldic charges assumed those strange and fantastic shapes and forms, such as the lion with two heads or tails, the eagle with two heads, which has been assumed by different empires, although it originated with the Germans, to denote their eastern and western possessions.

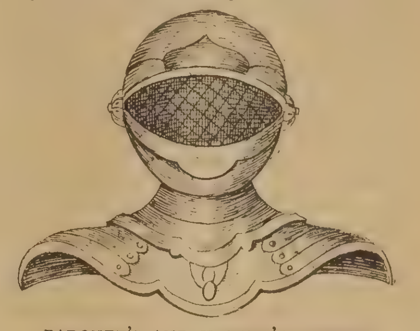
Favourite charges of primitive heraldry were the escallop shells, which later on came to denote pilgrims, travellers who had been on long sea voyages, weapons of war, pilgrims' staves, &c. The chevron, the bend and a ladder have had special virtues assigned them, as denoting the founder of a family. The Passion and lambeaux crosses, stars and lilies denoted ecclesiastical arms, or the arms of those who had fulfilled vows. Swords, offensive and defensive weapons and armour, and flames, denoted warriors. The *water bowgets* were charges frequently assumed in early heraldry. They were bags made out of the skins of animals, in which water was carried by soldiers and pilgrims when about to undertake long marches. Animals of every kind and in every position, and fabulous animals, were pressed into use by the heralds. The vegetable world was also ransacked and the sun, moon and stars shone on many shields.

One or two peculiarities with regard to the shield ought to be mentioned. First, in describing a shield and its charges, the dexter and sinister sides are so called from the position of the shield when worn against the chest of the bearer and not with regard to the spectator. The only woman entitled to wear her arms on an ordinarily-shaped shield is the reigning Queen, or the consort of a King; the proper shield for maidens and widows is a diamond. Knight bannerets wear their arms emblazoned on a square shield. Illegitimate heraldry, that is to say, merchants' marks and rebuses, ought to be borne on round shields, technically termed targets.

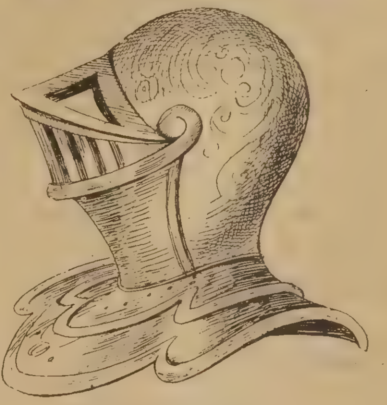
The exterior ornamentations of a shield are termed *mantling* (sometimes *lambrequins*); they are represented as a scarf, the *cointise*, used by the old military commanders round their waists and over the shoulder, or as the *robe of estate*. When it represents the cointise or scarf it is always borne in rags, so as to represent the wear it has sustained on the field of battle. The robe of estate of a sovereign is of gold, lined with ermine; a peer's is crimson lined with ermine; and knights and commoners have their's in their livery colours or crimson lined with white. Maidens and widows surround their escutcheons with *lacs d'amour*, or cords with running knots, and married women have *cordeliers*. The other exterior ornaments are the scroll, on which the motto is placed, and the wreath, two pieces of silk twisted together representing the colours of the livery, on which the crest is placed. In describing or emblazoning a wreath, the first twist, beginning from the dexter, ought to be of metal and the last of colour.

Coronets, caps of maintenance and helmets are also exterior surroundings of the shield. In English heraldry there are very strict rules with regard to the helmet; the helmet of kings and royal princes is placed full face, is of gold lined with crimson, and has six bars to the vizor; the helmets of peers are in profile, are made of steel ornamented with five golden bars to the vizor; baronets and knights of every grade have a full-faced steel helmet with an open vizor without bars to it; esquires and gentlemen of coat-armour have a helmet in steel borne in profile, with a closed visor without bars. A helmet is often surmounted by a crown, coronet, or crest. Some helmets open in front in two parts, the upper portion being termed the visor, for seeing through, and the lower part the beaver, through which the knight could drink.

The cap of maintenance, or dignity, is a cap of crimson velvet lined and turned up at the edges with ermine. It has two long points behind. Originally it was worn by those who had a right to enrol and maintain an army. It is now worn only by dukes and a few families who wear it as an ancient privilege, and these place their crests on the cap instead of the wreath.



BARONET'S AND KNIGHT'S HELMET.



ESQUIRE'S HELMET.

Supporters consist of animals, real or fabulous; men in armour, clothed or naked; and sometimes of inanimate objects, placed on each side of the shield. A well-known example of inanimate supporters are the pillars of Hercules, the supporters of the arms of Spain. Sometimes escutcheons are placed on the breast of an eagle displayed. Menestrier says that supporters are derived from a custom that prevailed of having the armorial shield carried by two pages, before their master, on all grand occasions. These supporters were at first, it has been argued, only freaks of the painter's and engraver's imagination, and had no real heraldic significance. There is circumstantial evidence, however, that these exterior ornaments had important significance, as denoting territorial dominion, success in warfare, family alliances, etc. But the use of supporters was at last restricted, in England, to the sovereign, princes of the blood royal, peers, peeresses, knights of the Garter and knights of the Bath and a very few ancient families who use supporters as a special privilege; Sir Walter Scott was one of the few who were granted supporters by Lyon King-of-Arms after the general restriction of supporters to personages of high rank.

2. Engrail. 4. Wavy. 6. Indented. 8. Embattled.

A PRIVATE LIBRARY.

By E. S. HARTLEY.

THE library illustrated on one of our inset sheets this week is a long room with a fireplace at each end, and, of the two sides, one is lined with bookcases, facing two quaint leaded casement windows on the other.

A comfortable feature of the room is the way in which the fireplaces are treated. A screen is thrown across the end of the room, about 5ft. from the mantel fitting, the upper part of which consists of a cupboard with roundels in the doors, and in the recesses on each side a reproduction of an old master. Below is a large face of green glazed bricks, with a bright iron grate in the semi-circular hob fire opening, while the small "pot-holes" on the right and left serve to break up what might be an uninteresting mass of colour, at the same time being very useful for receiving the glass or pipe of anyone who is sitting by the side of the fire.

Cupboards and shelves are continued round the ingle to the wings of the screen. Under these are placed seats covered in an old tapestry of a faded indigo—a restful colour, restfulness being an essential detail in such a room as the library. This completes the treatment of the inglenook, which is really a room in itself, to which one can repair to read or study, and obtain more seclusion than is possible in the middle of so large a room.

There is but one entrance to the room, which is in a recess at the centre of the bookcase side, thus giving no opportunities for making the library into a means of transit to other rooms, which would inevitably be done if there were a door at each end.

There are two bookcases, one each side of the door, terminating at each side on the inglenooks; these bookcases are the height of the frieze moulding of the room.

The windows opposite are so arranged as to throw a horizontal light on the bookcase; for this reason they are not carried up to the ceiling, as one would imagine to be the best, for it would only make the light too glaring to work by, and, from an architectural point of view, it would not do to spoil the symmetry of the elevations of the room by breaking the frieze, as the opposite side could not be treated in a similar way.

The table, of which only the top can be seen in the sketch, stands on two legs, the top being secured to the legs by means of brackets on each side.

The chairs are comfortably upholstered in pig-skin, a distinctive feature being the large copper-headed nails which secure it in the seat and back. The remaining portions of the walls below the frieze moulding are treated with narrow V-section match-boards. Into this, opposite the door, may be let a family portrait, or some other picture, with, perhaps, a loose seat under, about the same width as the door. This will have the effect of balancing the two sides of the room.

The frieze is carried out in broken, transparent colours of blue, green, brown, and gold, on a very coarse canvas, and thus makes a pleasant contrast to the severity of the woodwork below, which is of oak stained a dull grey colour, obtained by using a very dark stain diluted, and then slightly polished. The ceiling is set out in squares, by means of flat battens, which are stained to match the other woodwork, the intervening spaces being distempered a dull cream colour. The floor is stained a much darker colour than the other woodwork, and has a few Oriental rugs laid about at pleasure.

The London School Board Annual Report says that during the past year nine new schools, accommodating 8,942 children, have been opened at a total cost of £240,239 for sites, buildings, and furniture; or an average cost of £26 17s. 3d. per head. At Lady Day there were sixteen schools and twelve enlargements in course of erection, and thirty-five additional sites for new schools have been or are being purchased.

Views and Reviews.

ABBEYS AROUND LONDON.

This is a cheap compilation of facts relating to the numerous abbeys that surrounded London in the Middle Ages. The information given is interesting and there are many illustrations, but the printing is bad and the cover and headpieces are still worse. If the intention was to make the latter emblematic of the particulars that follow, a little more care and taste ought to have been observed in carrying it out, as a page with nearly a third of its space taken up by crude black letters and ornament is not calculated to please the eye. In a book of this class, this fact ought especially to have been remembered, for the information supplied is not new and it ought, therefore, to be presented in a pleasing manner. To render the book still less attractive to the eye, it is enclosed in a cover of a sickly yellow colour.

"Abbeys Around London." By John A. Randolph. London: The Mercantile Press, 190, Ebury Street, S.W. 1s.

CENTRAL ELECTRICITY STATIONS.

Mr. Gay, who is the electrical engineer to the Islington Vestry, and Mr. Yeaman, the assistant engineer, have produced a book that accomplishes its aim—which is what its name implies. For the experienced engineer it is not intended, and there is little in it of any real value to him, but it should prove very helpful to the young electrical engineer, the man who is completing his time in the shops and drawing office, and who will soon be looking about him for a position in this branch of his calling. Faraday made his important discovery of electro-magnetic induction in 1831, but nearly fifty years elapsed before the dynamo began to be used on any large scale. Since then, however, great advances have been made, and at the present time it is surprising to note how electricity for lighting and power purposes is being adopted. In 1889 there were very few supply undertakings doing actual work; now more than a hundred are engaged in the business. The authors complain, rightly, of the scamped wiring work that is often done and long for a Board of Trade standard set of rules, with penalties for non-compliance. As a good arrangement it is suggested that when electricity station buildings are in hand the engineer should draw up his own plans, the architect keeping his plans as nearly as possible to those of the engineer. This is sensible. How much better it would have been in many cases if architects had combined with engineers with regard to certain structures, and *vice versâ*. Often the architect describes the engineer's creation as hideous, while the engineer retorts that the architect's building, or bridge, is deficient in construction. The difficulty in matters of this sort is to decide who is to take the first step. There are thirteen chapters to the book under review, dealing with the numerous details connected with central station work, much useful information being given in the last chapter—on running and management. As stated before, the book can be recommended to those about to enter this branch of electrical engineering.

"An Introduction to the Study of Central Station Electricity Supply." By Albert Gay, M.I.M.E., and C. H. Yeaman, A.I.E.E. London; Whittaker and Co., 2, White Hart Street, Paternoster Square, E.C. 10s. 6d.

BUILDING SOCIETY CASES.

This should prove a highly useful book to those interested in the management and working of Building Societies. These compilations of cases affecting various subjects and trades or professions are increasing in number, for their usefulness in giving a knowledge of disputed points to the layman as well as the lawyer is apparent to everybody. In the work under review the cases are not given in the best order for ready reference, but this objection is reduced by the provision of an index. An important decision reported in this book is that of Seal v. Merthyr Tydfil Urban Council. In this action the owner was summoned under the Public Health Acts to abate a nuisance arising from a defective drain under the gardens at the rear of his houses, and was ordered to abate the nuisance by the justices, who held that the drain in question (into which flowed sewage from houses of the owner, as well as from adjoining houses, before it entered the sewer) was a "private drain" within the meaning of the Public Health Act, 1890. Against this decision the owner appealed on the ground that as the drain was used for houses belonging to different persons it was a "sewer," and as such repairable by the local authority. This appeal was dismissed, on the ground that the drain was a private one—*i.e.*, a drain constructed on private grounds to which the public had no access. An excellent feature of the book is the appending of side notes in small type in the margin, giving shortly the subject of the case and the decision.

"Judicial Decisions Affecting Building Societies: Reprinted from the 'Building Societies' Gazette,' 1897-1898."—Vol. III. London: Building Societies' Association, 73, Ethelburga House, Bishopsgate Street Within, E.C. Price, 5s.

MODEL ANSWERS TO EXAMINATION QUESTIONS.

Answers to Questions set in the Intermediate Examination held by the Royal Institute of British Architects, June, 1899.

By G. A. T. MIDDLETON and R. W. CARDEN, Associates R.I.B.A.

(Continued from page 288, No. CCLIII.)

IX.—THE SEVERAL VARIETIES OF CLASSIC ORNAMENT.

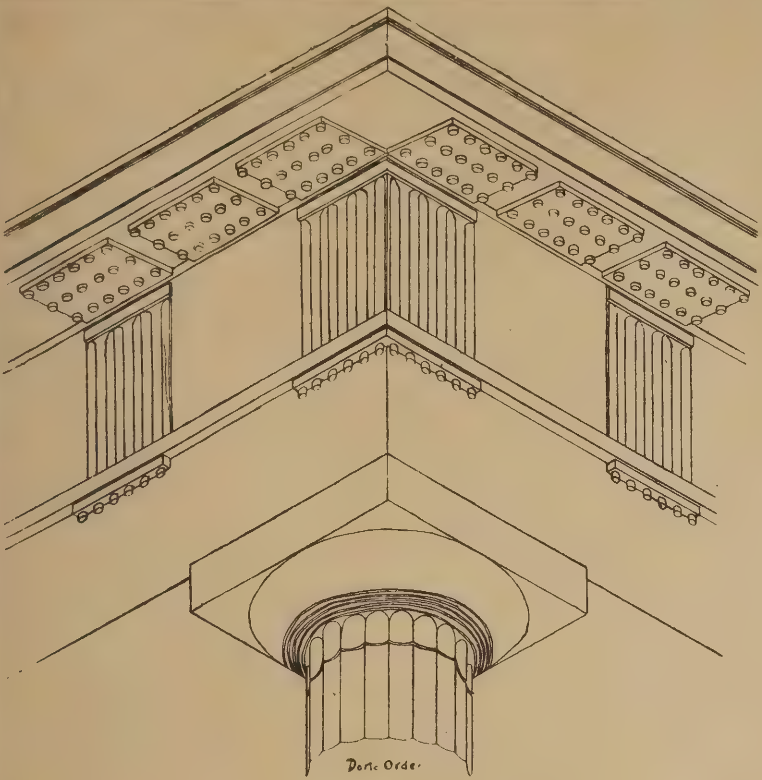
1. *Give a freehand perspective sketch (about 4in. high) of an angle of the entablature either of the Doric, Ionic, or Corinthian order, without pediment, but showing the cap of column.*

(See illustrations. Great care should be taken not to attempt to show too much detail, but all ornaments should be indicated in their proper positions.)

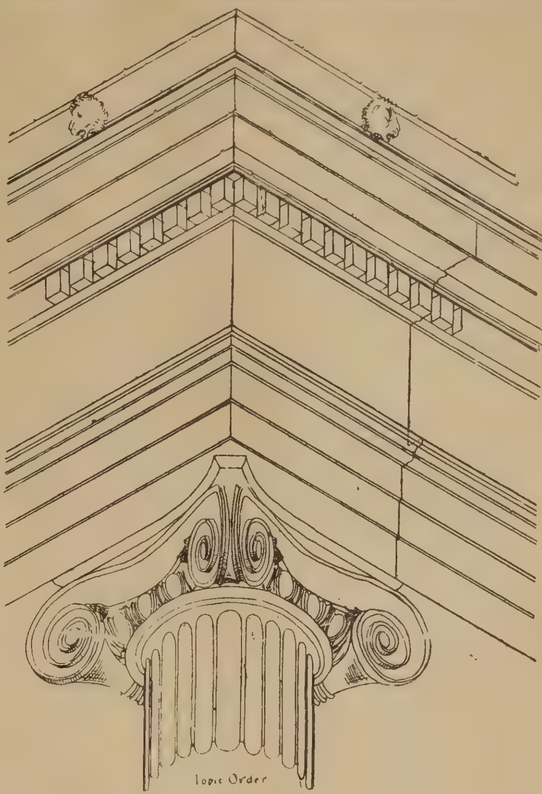
2. *Draw (to about 3in. high) one or two examples of Stele.* (See illustrations.)
3. *Give a section (about 1½in. high) of the mouldings answering to the following terms, and sketch their respective proper enrichments: Ovolo, Torus, Astragal.* (See illustrations.)

St. Marylebone Church Institute and Club at Paddington Street, N.W., was opened last Wednesday. In addition to a central hall, there is a library, and dining, reading, games, billiard, sitting, and bed rooms; access to the mission church is obtained at the rear of the institute. The total cost of the new building is about £9,000. Mr. T. Harris, F.R.I.B.A., of Bloomsbury, was the architect, and Mr. H. H. Sherwin, of Waddesdon, the contractor.

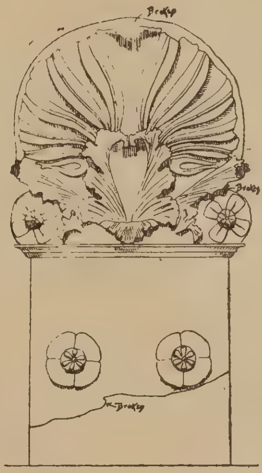
The Roman Villa at Brislington, Bristol.—We gave some particulars on page 340 of last week's issue of the discovery of a Roman villa at Brislington. Some mosaic pavement was found on land belonging to the Bristol and District Land Company, Limited, who have expressed their willingness to present the pavement to the local museum, and to allow further excavations to be made. It may be stated that during the excavations for the new road which laid bare the pavement, the workmen came upon an old road at a spot about fifty yards nearer to the main Bath road, at a depth of 4ft. or 5ft. from the surface; this was probably an old Roman road, and may lead to further discoveries.



Doric Order

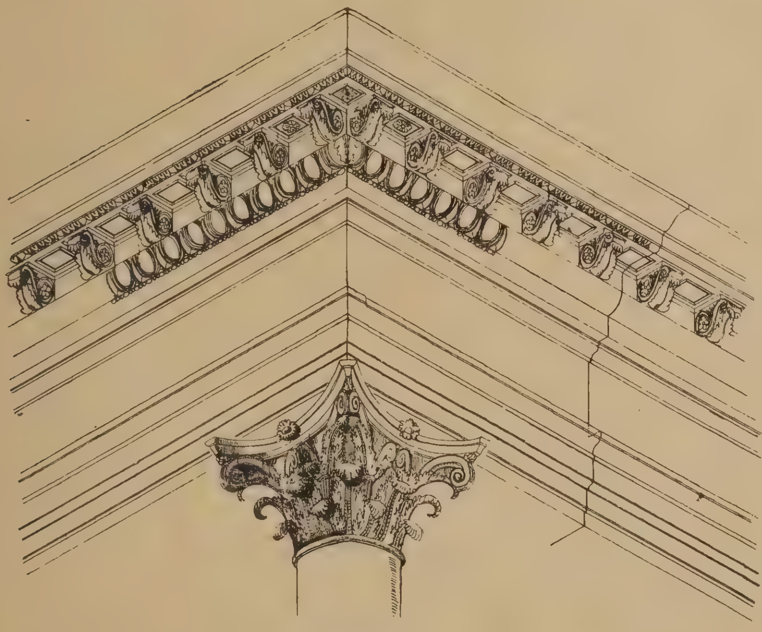


Ionic Order

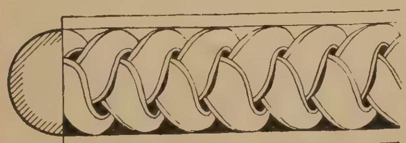


Stele from Athens.

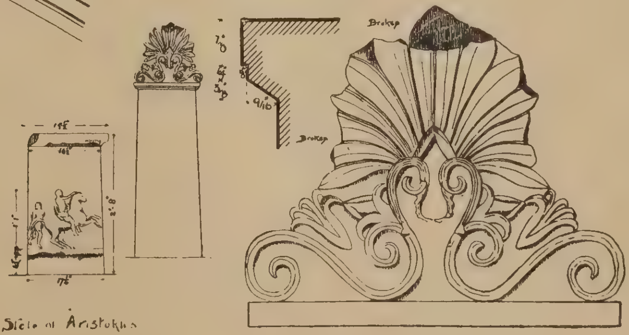
in the British Museum.



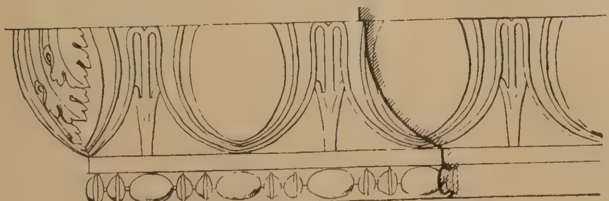
Corinthian Order



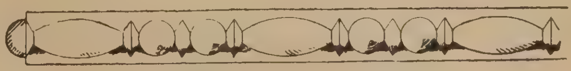
Torus, with Guilloche Ornament



Stele of Aristokles



Ovolo with Egg and Tongue Enrichment



Astragal, with Greek Bead Ornament

ANSWERS TO EXAMINATION QUESTIONS.

THE BUILDING TRADES IN 1899.

THE timber trade during 1899 has continued to prosper. Increasing profits have been made by the producing shipper and the carriers of timber. It is, however, doubtful if the importing merchant and large middleman have made profits commensurate with the strain caused by a growing impression that prices were unhealthily high, and the discontent at the screwing-up, which the increasing import-cost forced the merchant and dealer on this side to apply to the consumer. Large forward commitments were therefore a matter of difficulty and although the growing demand made the volume of "hand-to-mouth" business consistently good the adjustment of producers' and shipowners' views with those of consumers has been difficult and middle profit consequently lean. The heavy discount rates for trade bills with which the present year opens tends to further "whittle down" middle profits, but the growing reluctance to face up to heavy forward commitments causes a pleasing absence of unsound finance; and the timber trade generally stands on a sounder financial footing than has obtained for many years past. In last week's issue we gave details of the state of trade in many important centres; the following further particulars have since come to hand.

ENGLAND.

Barton.—Over fifty houses have been completed and tenanted during the past twelve months, and all of them were tenanted without disturbing the population of the older portion of the town. By far the most important branch of trade in Barton is the brick and tile manufactures, both as to the export business and the number of men employed. During the past season the weather was exceptionally favourable for making, and the demand being steady and continuous stocks were cleared out as fast as manufactured, except in the case of a few makers, who preferred to hold for a prospective rise in prices. This came at the end of the season and has continued, although probably the present weather will slightly check the demand.

Devonport.—There has been a steady improvement here in the building trade. The great civic function of the year was the opening of the new Technical Institute by the Mayor at the latter end of July, when Sir William White, director of naval construction, unveiled a coloured window. Another interesting ceremony was the laying of the memorial stone of the first block of workmen's dwellings in James Street. The building of another block in Morice Square is under consideration.

Driffield.—The building Trade has been brisk here, and the new church of St. John, in Lockwood Street, will be completed in two or three months. This is the most important of the buildings erected in 1899, and is the first episcopal church that has been constructed in the town since the thirteenth century. Improvements have been effected at the parish church by the erection of a wind porch at the west entrance, the seating of the tower basement and the filling in of a large window in the south aisle with stained glass.

Exeter.—The trade here is progressive. The most important building erected last year was the New Technical College, which has been added as a wing to the Albert Memorial Museum to commemorate the Diamond Jubilee of her Majesty the Queen. The first section of the new buildings of the West of England Eye Infirmary have been almost completed

Grimsby.—The past year witnessed the advent of a forward movement in public works, though as yet no very great strides of a practical nature have been taken. Probably the greatest have been the adoption of the electric light, with the building of a station at a cost of £43,500; the adoption of the Public Libraries Act, with the sanction of the Local Government Board to take over, alter, and convert the Mechanics' Institute into a free library; and various street improvements. A new fever hospital is just upon completed.

Torquay.—There have been no great municipal developments at Torquay itself, but at Goodrington the district council have several big schemes in hand, notably the conversion of the Marshes into a recreation ground and the provision of a water supply from Dartmoor. Much building has been done at Goodrington, and Mr. Paris Singer has been carrying out an important improvement in the construction of a marine drive in the direction of Torquay. The estate adjoining the drive is being laid out for building.

Truro.—The year has witnessed the inauguration of at least four things of the greatest importance to the city. The building of the nave of the cathedral has commenced. Delay and agitation extending over a quarter of a century have been brought to a conclusion by the adoption of sewage interception and disposal schemes, which will shortly be investigated by the Local Government Board. The third great enterprise is the Truro-Newquay Junction Railway. This new line, whose route lies by way of St. Agnes and Perranporth, will shorten by about one-half the present railway journey from Truro to Newquay, and it is certain to have a beneficial effect upon the whole district. During the year the new station at Truro has been completed and is now the finest in the county. The construction of stone bridges to take the place of the great wooden viaducts immediately to the east of the station has been commenced. Another movement pregnant with great possibilities for the welfare of the city is that which brought about the erection of the Central Technical Schools for Cornwall. The building cost over £7,000, and Mr. Passmore Edwards contributed £5,000.

IRELAND.

The progress in the building trades in Ireland will be evident from the returns of the Board of Trade, which show that £660,000, or £40,000 in excess of last year's total, was advanced on various loan services. The following are the more important channels in which this large sum has been distributed:—Improvement of farms by landlords and tenants, about £71,000; acquisition of glebes and erection of teachers' residences, £22,000; expenditure under the Acts for the improvement of labourers' houses, £110,000; improved and extended accommodation for lunatics, £240,000; housing of working classes in towns, and public health loans for water supply, roads, lighting, &c., about £118,000.

Belfast.—In a progressive city like Belfast, which is continually extending its borders, it is only natural that the building trade should be one of the most active local industries. Within recent years the number of new streets constructed and houses erected has been very large, and this class of work is still going on. The chief work, of course, has been the building of the new City Hall. The block known as the Scottish Provident Buildings at the corner of Donegal Square West and Wellington Place has been completed, and it is intended to continue this block further along Donegal Square West. At the other side of the square, at the Chichester Street corner, the Ocean Accident and Guarantee Company, Limited, intend to erect a fine block somewhat similar to that of the Scottish Provident Institution. It is probable that the two chief undertakings entered upon during 1900 will be the erection of the Royal Victoria Hospital and the Technical Institution, and as the former will cost not less than £70,000, and the latter close on £60,000, both these contracts will be very important ones. The past year has been most successful so far as local plumbing firms are concerned, chiefly to be attributed to the enforcement of the new sanitary bye-laws passed by the Council of the county borough and the erection of numerous residences in the suburban districts since the extension of the city boundary. The profits, however, have proved comparatively small, as all classes of material early in the year considerably advanced in price and wages increased in proportion to the demand for competent fitters and attendants. Owing to the demand from builders of small property having almost ceased, there was not much activity in the timber and slate trade during any portion of the year. The stagnation was useful in clearing out of the building trade many who ought never to have been in it, and legitimate builders should have a more satisfactory experience for the future. Demand from the large local contractors has been steady and that from country merchants fully up to the average. Prices abroad steadily increased from the spring time of the year, and they are now higher than they have been for many years past, and there does not seem to be any probability of lower rates being obtainable in the early future. Slates have been scarce, Bangors coming forward very slowly, while Americans have almost ceased to be used, as they were chiefly taken up by small builders, who are not now so much in the running as formerly. Laths and other goods in connection with the timber trade have steadily increased in value, and it may safely be said that prices are almost certain to remain upon the present high level for many months to come.

SCOTLAND.

Arbroath.—The building trades have fully maintained the previous year's activity, though the outlook is not considered to be quite so hopeful. A good many important street improvements have been carried out during the year. Amongst the buildings in prospect are the new shambles in Grimsby and the new epidemic hospital for the town and district. The work in connection with these should afford employment for a large number of hands. In the suburban districts large numbers of handsome villas have been erected, and there is still a demand for this class of residence. Numerous handsome blocks of working men's houses have likewise been put up during the year, and, notwithstanding the fact that many families have been obliged to migrate in consequence of the recent fires, there still appears to be a scarcity of working class houses of modern construction.

Carnoustie.—Building operations have kept pace with former years, a large number of residences of a superior class having been erected. The outlook for this year is not so hopeful, as it is expected that the increased value of money in the open market will have a tendency to retard the erection of property.

Leith.—Last year compares favourably with other years as to number of petitions presented to the Dean of Guild Court for construction of new work and alterations of existing buildings within the borough of Leith. Several large buildings have been completed, while others, which should by this time have approached completion, have been left unfinished owing to the crisis in the whisky trade. Ninety warrants were granted by the Dean of Guild Court during the year, one being refused. Owing to the high prices of all materials and labour and the high interest for draft rates at the banks there appears every prospect of the past financial prosperity of the building trade receiving a check, and quieter times may be looked for in the future.

Pitlochry.—A public hall is being erected from competitive designs submitted by Mr. Wilson, of Dundee. With the exception of this hall, the building trades have not been quite so busy as usual, and unfortunately the outlook is not altogether cheering.

The late Mr. Henry Vaughan's Will comprises a list of specific legacies to the National Gallery, the National Gallery of Ireland, the Royal Institution for Encouragement of Fine Arts in Edinburgh, the South Kensington Museum, and other public institutions that fills thirty folios. The art works bequeathed include Raphael's "Christ on the Mount," a picture by Landseer, a number of drawings and sketches by Turner and Constable, all the studies of pictures by Reynolds and G. R. Leslie, and statues of Reynolds and Flaxman.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

BOOKS ON GOTHIC VAULTING.

GLASGOW. — A. G. writes: "Kindly inform me of any good work in which vaulting (especially Gothic) is treated."

The best books our correspondent can have are the three following: Willis's paper read before the R.I.B.A., on the "Vaults of the Middle Ages," now out of print, price 7s. 6d. nett, post free; "Rational Building," a translation of the article "Construction" in the "Dictionnaire raisonné de l'architecture" of M. Viollet-le-duc, by G. M. Huss, 12s. 6d. nett, post free; "European Architecture," an historical study, by Russell Sturgis, architect, 15s. nett, post free. The foregoing may be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C.

PENCIL MARKS ON LATRINE WALLS.

ELGIN, N.B.—E. writes:—"The latrine walls of an academy here, which are plastered smooth on the masonry, are habitually defaced by pencil markings, and I am invited to suggest a remedy. To plaster with cement finished off the float would make the walls very gloomy, and to line with glass or encaustic tiling is very expensive. Can you suggest a wash or other means of combating scribblers?"

Possibly Messrs. Szerelmey and Co., Rotherhithe New Road, London, S.E., may be able to suggest one of their water glass washes, but glazed tiles form the best wall covering in a case of this sort. HENRY ADAMS.

ARCHITECTS' APPRENTICES.

BLACKPOOL. — Constant Reader writes:— "Wishing to become a competent man, what should bound apprentices do during office hours when he has no work. Lists of books, etc., will oblige?"

This question is vague because no particulars are given of the querist's present qualifications or experience or of the goal he is aiming at, other than to become "a competent man," which is an ambiguous description. Our correspondent will, however, find, by referring to recent back numbers of the BUILDERS' JOURNAL, several replies giving advice as to the best books to read. See also an article on page 268 of our issue for December 6th, 1899.

COMB-GRAINING.

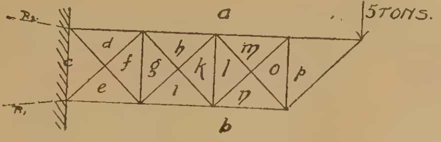
BRIXTON, S.W.—G. B. writes:—"Will you kindly inform me the meaning of the term 'comb-grain.' It was used in a specification of some work my firm recently did, of which I was the foreman, and our grainer interpreted it as meaning combing with a little figuring or graining. I had this done, and I am now told that I ought to have had the work plain combed. I see no mention in Laxton or Lockwood of comb-grain; each mentions plain combing or graining. I am told by a Manchester architect that comb-grain in the north of England is used to mean ordinary and inexpensive graining in distinction to plain combing and best graining. I see Lockwood mentions cheap graining?"

Although "plain combing" is the term in general use in the London district, the querist is entirely wrong in his interpretation of the term "comb-grain," the exact meaning of which is so self-evident—to me, at least. In cases where there is any doubt as to the precise meaning of any term, the old adage holds true: "Better ask the way than go a mile astray." H. E.

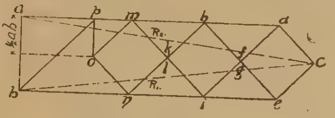
WORKING-OUT STRESSES.

TORQUAY.—A. B. C. writes:—"Will you kindly state how to ascertain the stresses in the various members of a framed wrought-iron cantilever (see accompanying illustration) by the graphic method? Middleton's "Stresses and Thrusts" only describes a simple crane or cantilever, and I do not know how to proceed beyond this."

The accompanying illustration shows the stress diagram required. The only difficulty lies in ascertaining the tension in the member between spaces *p* and *o*. The thrust in the member between *b* and *p* having been found, this must be resolved into vertical and horizontal components, when half of the vertical component will then be taken up by the bracing at bottom, and the other half transmitted by the member between *p* and *o* to the top. The other vertical members are not under stress. Or, by rule of thumb, as the spaces *o*, *l*, *k*, *g*, *f* and *c* lie half-way between the space *a* above and the space *b* below, so on diagram the points *o*, *l*, *k*, *g*, *f* and *c* will lie midway in verticality between *a* and *b*. Note, too, that the values and directions of the reactions are obtained by joining *c* to *a* and *c* to *b*. G. A. T. M.



WROUGHT-IRON CANTILEVER.



STRESS DIAGRAM.

CONCRETE WALLS FOR COUNTRY HOUSES.

EALING, W.—H. writes:—"Would you kindly tell me what are understood to be the advantages and disadvantages of these walls on a hill in a high chalky district. Will they stand wind and weather as well as brick, and is any special method of construction recommended? Are they liable to make a house cold, and will the resonance be sufficiently apparent to be inconvenient?"

In a chalky district, cement should be cheap, and cement concrete cheaper in proportion, than brickwork. If built with good foundations, concrete walls stand well and keep out the weather. The interior of the dwelling will be less liable to fluctuations of temperature than with brick walls, but a damp day after cold weather will be apt to set the inside walls streaming. Care should be taken to use the cement cool, and not to work at the face in wet or frosty weather. Ventilation must be specially attended to. The resonance is sometimes objectionable, but is less with porous material for the aggregate of the interior walls, such as pumice or coke breeze. HENRY ADAMS.

THE ERECTHEION.

MANCHESTER.—STUDENT writes: "I have read Mr. Marshall's interesting articles on Greek architecture in recent numbers of the BUILDERS' JOURNAL, and I would like to know what he considers the most correct work on the Erectheion."

Complete information respectnig the construction and details of this building is not, I believe, to be found in any single work on the subject. The most valuable contributions are the papers printed at various times in the journals of the societies established for the study of Greek archæology in Athens, England, and America. In the Athenian "Practica," the "Journal of Hellenic Studies," and the "Journal of the American School of Classical Studies," Boston, will be found material for complete drawings of the building as it now stands, with almost every joint correctly shown. These papers may well be supplemented by some diagrams in the last edition of Mr. Penrose's "Principles of Athenian Architecture," and by the more popular yet comprehensive account in Miss Harrison's "Mythology and Monuments of Ancient Athens." Stuart and Revett and Inwood are interesting and useful because they show portions of the building which have disappeared since their time; but Inwood's working details for the church of St. Pancras should have been kept out of his book, as they are apt to get mixed up with the Erectheion. For details "Student" should visit the British Museum. Some practical details will be found in Durm's "Die Baukunst der Griechen," and fragments of sculpture from the frieze are given in Schone's "Greek Reliefs." The inscriptions relating to the building will be found translated and explained in Wilkins' "Prolusiones Architectonicæ," Newton's "Greek Inscriptions in the British Museum," and also in the journals above referred to. Lastly, I may refer querist to a paper by Mr. Fergusson in the Transactions of the R.I.B.A., 1876. This by no means exhausts the bibliography of the subject, but a great deal has been written which need not be read. JOHN A. MARSHALL.

A QUESTION ABOUT DRAINS.

NORTHAMPTON. — BAYSWATER writes: "I shall be pleased if you will kindly reply to the following queries:—The drainage from house No. 1 is connected to that of house No. 2, and has been for many years. The owner of No. 2 had orders from the Vestry to put in a new drain to his house, and now the work is finished he asks me, as owner of No. 1, to pay £10 towards the cost of the drain. If I had been consulted before the work was done I could have so arranged that it would have cost much less than it has. (1) As the No. 1 drains have been passed as good, and time gives me an easement, can I be compelled to pay a portion of the cost? (2) Am I required to provide a storage cistern where there is a constant supply from the water company's main in London?"

(1) Where two or more houses belonging to different owners are connected with a public sewer by a single private drain, the local authority can, under section 19 of the Public Health Acts Amendment Act, 1890, compel the owners to contribute proportionately to the expense of repairing such single drain, the proportions to be settled by the local authorities' surveyor, or, in case of dispute, by a court of summary jurisdiction. When the necessary work has been done by one owner, the local authority will probably take no action; but it appears that the said owner has a valid claim against the other owner, provided that he himself was legally liable. In cases where the local authority has not adopted Part III. of the above-named Act, it appears, from several legal decisions, that a drain which receives the drainage of two or more houses is a "sewer" for all purposes of the Public Health Acts except the above. The Act of 1848 vested all "sewers" in the local authorities, who are liable for the expenses of repairing the same, except under the circumstances explained.

(2) It depends upon the provisions of the special Act under which the water is supplied. Under section 54 of the Waterworks Clauses Act, 1847, if by the special Act it be provided that the water need not be constantly laid on under pressure, every person supplied must, when required by the undertaking company, provide a proper cistern, with ball and stop-cock, etc. G. H. B.

BUILDING SOCIETIES AND PROPERTY BUYING.

GOLD COAST, BRITISH WEST AFRICA.—S. writes: "I shall feel much obliged if you will enlighten me on the following points:— (1) I wish to purchase land for building purposes. Would I do well to go to a building society? (2) Would it be safe to leave the title-deeds of such land in the hands of the society? (3) After once the land is bought, would there be any rent which I should have to pay, or would that land be wholly and absolutely my own? (4) Kindly oblige by giving me any other particulars you can, so that when purchasing I may feel satisfied that I am legally entitled to the lands I have bought, and that the documents transferring the land into my hands are legally correct."

(1) Whether you should go to a building society or not must depend on whether you require an advance for the purpose of your purchase or not. If you do, you will probably find it convenient to obtain it from a building society. (2) If you obtain an advance from a building society, you will have to give them a mortgage on the property, and they will be entitled to get up the title-deeds, and retain them until the mortgage debt has been paid off. The deeds will be as safe in the possession of a respectable building society as anywhere. (3) This would depend upon the nature of the estate in the land which you acquired. If you bought the fee-simple of the land, it would become yours absolutely free from the payment of any rent, but subject possibly to such outgoings as tithe rent charge. If the person from whom you bought the land held it on lease at a rent, you would take it for the term of the lease under which he held it, and subject to the rent reserved by, and the covenants contained in, the lease. Or, though the person from whom you acquired the land might be himself the owner in fee-simple, he might be unwilling to part with his entire interest, and would only agree to grant you a lease for building purposes for a term of years, at a rent. (4) It is quite impossible for us to give you the particulars you require. No one but a lawyer can possibly form an opinion on the question of title to landed property which it would be safe to act upon, and a lawyer can only do so when he has had before him the deeds and documents by which the title is deduced, and has made the necessary investigation and searches. Nothing should induce you to act as your own lawyer in so serious a matter, where you are going not merely to lay out money in the purchase of land, but to expend further sums in building upon it. If you so desire, we will, in a private letter, give you the name of a solicitor in whose hands your interests will be perfectly safe, and who will probably be able to find the class of property which will suit you. Further than this we cannot help you.

A. H.

PURIFYING WASTES.

Reigate, Surrey.—C. E. S. writes:—"Is there any simple means by which the wastes of bath and scullery may be so purified that they may be used to run into an artificial pond in the garden?

No method can be recommended which will provide a cheap and simple means of purifying the fouled waters from a bath and scullery sink, so that the effluent may be run directly into an artificial pond. For a simple and inexpensive method of bath and sink water *disposal*, a filter bed and filtration gutter, as suggested by Dr. G. V. Poore in his well-known work, "The Dwelling House," might be adopted provided the local circumstances are favourable.

T. E. C.

VALUATION OF REPAIRS.

Daventry.—Arson writes:—"Is it necessary for an architect to hold a valuer's licence to enable him to go on to premises where a fire has occurred, and to give to his client (who is a company) a written estimate of the cost of repairing the damage done to the premises by the fire? If architect's estimate is produced in court, could it be considered as a valuation?"

It is not necessary for the architect to hold a valuer's licence, because his valuation will be made for the information of one person only—the company, who are his clients—and is not obligatory as between parties. If the estimate made by the architect is produced in court, it could not be considered as a "valuation" within any enactment requiring a valuer to hold a licence. See 46 Geo. 3, c. 43 (Eng.); 5 and 6 Vic., c. 82, s. 19 (Ir.); and Stamp Act, 1891, s. 24, and Sch. 1.

A. H.

Bricks and Mortar.

Aphorism for the Week.

"*Architecture is thought behind form.*"—W. R. Lethaby.

Brahan, Perth: The Garden Front. One or two designs for this house for R. D. Pullar, Esq., were made, but that reproduced on one of our inset sheets this week shows the house as completed. The walls are built of stone, the whole being afterwards rough cast. The roofs are covered with green Westmorland slates. The hall is panelled in oak about 7ft. high, and has an oak staircase; above the panelling is a plaster frieze of roses and honeysuckle, modelled by Mr. G. P. Bankart. The dining-room is panelled in oak about 8ft. high, with panels inlaid with flowers; it has an oak-beamed ceiling and ingle nook, with copper *repoussé* panels by Mr. Edgar Simpson, of Nottingham. The library has bookcase fittings, chimney-piece, and dado of walnut inlaid and rosewood. The drawing-room has a panelled dado, chimney-piece, &c., of cedar, inlaid with mother-of-pearl, and has a plaster ceiling modelled by Mr. G. P. Bankart. The billiard-room has an oak-beamed ceiling resting on carved stone corbels, and an oak dado about 5ft. high. The ingle nook is in stone, and is carved with subjects representing Day and Night and the common flowers of the district. The interior of the nook is decorated with tilework by Messrs. C. W. Williams and Co., of Manchester. The two principal bedrooms are panelled in white painted woodwork, and the whole of the windows are in leaded lights, those of the principal staircase being by Mr. Stephen Adam, of Glasgow, and those of the drawing-room by Mr. Geo. Walton; the remainder of the ornamental glazing has been made from full-size cartoons by the architects (Messrs. Francis W. Bedford and Sidney D. Kitson, of Leeds), and carried out by Mr. W. Pape, of Leeds. The sanitary, heating, and electric-lighting arrangements have been carefully considered.

The design for the Central Library at Hull (which we also illustrate on one of the inset sheets) was submitted by Messrs. Bedford and Kitson in the recent competition. The materials intended to be used were brick and stone.

"The Gables," Reading. This house (see inset sheet), the residence of its architect, Mr. W. Ravenscroft, of 22, The Forbury, Reading, is situated on high ground in the west suburb of the town, and the site being a sloping one the house is placed on a terrace, beneath which is a tennis lawn and further down the hill a small orchard. The dining-room, as will be seen by the plan, is so arranged that it can be divided into two rooms, and the accommodation, in addition to that shown on plans, consists of two very large attics, with box rooms, &c., and ample cellarage, cycle house, &c. The materials chiefly used are old brick, brown tiles, and rough cast. Messrs. Collier and Catley were the contractors.

A Museum of Living History. Mr. Henry A. Spaulding, a well-known man in America, has evolved a scheme for building a "museum of living history," which is to become, it is hoped, the Parthenon of the United States. Plans and elevations have been prepared by Mr. George B. Post, which show a huge building in the classical style, with an immense dome. Part of the plan is to build a huge stone quay, from which a mighty stair, ornamented with statuary, will lead to the museum. It is proposed to acquire a site on the upper coast side of New York City. The material to be used is gray granite and marble, and the ground plan is that of a cross, superimposed on a circle. This circle is 800ft. in diameter, and it incloses five circular galleries—two concentric circular galleries on the main floor, having together a width of 125ft., two below these, and one above the outer gallery. The outer circular gallery thus has two stories above the ground; the inner circular gallery has one. These circular galleries are intersected diametrically on the ground floor by four wings at right angles to each other, each having a length of 800ft., a width of 200ft., and a height of 35ft. These four wings are to be known respectively as the Donors' Hall, the Hall of Literature, the Hall of Religion, and the Hall of Gifts. They will be surmounted, at their intersection, by a central and open dome, rising to a height of 404ft., and having at its base a diameter of 250ft. The interior of the building is carefully and elaborately planned to systematically and comprehensively represent every branch of art, science, and industry—every form of human endeavour. The provisional builder's estimates of the proportions of this building are for a structure to cover about nine and one-half acres of ground. The length and width of the building, 520ft.; floor surface of rotunda, 24,328 sq. ft.; four entrance halls, each 11,448 sq. ft.; four inner galleries, each 3,230 sq. ft.; four outer galleries, each 5,616 sq. ft.; one first floor, including stair halls, &c., 130,880 sq. ft.; second storey, 51,464 sq. ft.; in all, 182,344 sq. ft. Picture lines, rotunda, 496ft.; inner galleries, 944ft.; outer galleries, 1,164ft.; upper galleries, 4,056ft.; in all, 6,660ft. The cubic contents of the building are to be 17,736,355 cubic feet, of which 4,605,488 cubic feet are below the first floor.

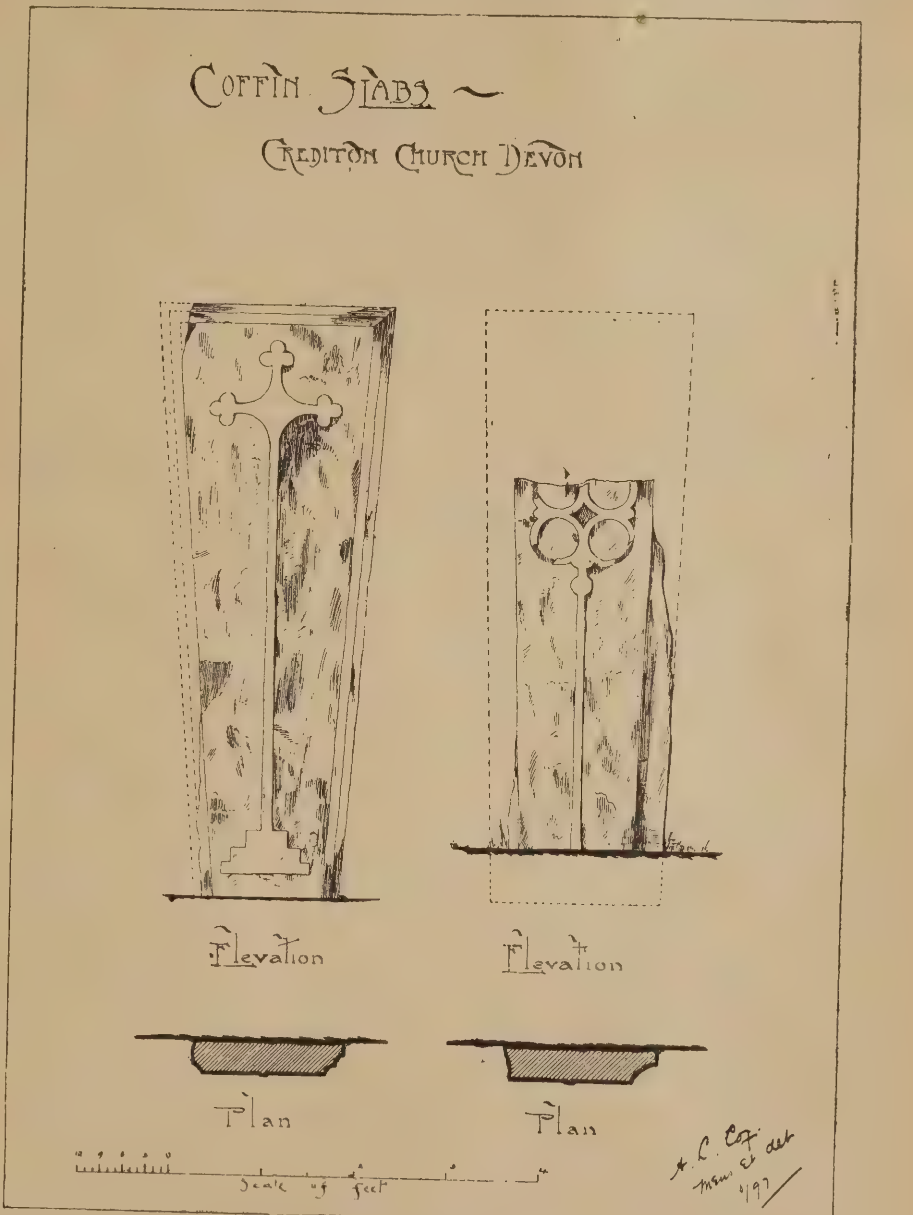
Monuments to Art and Industry. Mr. Spaulding has had a wide experience in art matters, and in explaining his plans he says:—"As man progresses and learns the steps by which he has climbed out of the past, surveying the rude ladders upon which he has mounted, a natural desire arises to mark off the heights he has gained by white monuments, carved with nicest cunning and reared not alone for his own satisfaction, but to point other more tardy climbers. Thus is born the exposition, the centennial, the world's fair of the nations. By these aggregations of art and industry the people of the whole earth come in touch with each other. Such was the first World's Exposition, the Crystal Palace of London; such was the International Exposition at Paris; such was the magnificent World's Columbian Exposition, and such must be all those to which the future is to give birth. Such a monument of progress is the South Kensington Museum, an outgrowth of the Crystal Palace. In this great school, founded by the late Prince Albert, one of the most enlightened minds of his time, with its means and adjuncts for education, we see a speaking illustration of what can be done by vital force. It is safe to say that its influence upon the minds of the British people is greater than all the inactive art collections of Great Britain put together. It is real eloquence; the rest are sermons delivered with folded arms and closed eyes. The Kensington Museum from its first foundation became at once a potent influence in the cause of art among the people of the British Isles. It has proven of inestimable value to them, and its influence is now felt in the remote corners of Her Majesty's dominions and of the world. America should have its Parthenon—a worthy abiding monument to its ever-accumulating evidences of the great part it is destined to play in the story of the nations."

English Influence on French Art. In a series of articles by Claire de Pratz on "Why we are not loved in France," now appearing in the "Westminster Gazette," it is stated that the French, seeing the effect of English training, make an earnest effort to assimulate what they judge to be the best of English life, customs, education and art. So great is this movement towards the comprehension of English methods in France that an apt word has been coined to express it—"l'Anglo-Saxonisme." In art its influence has been very important. The Pre-Raphaelite school in painting and Mr. Morris's teaching upon home decoration have had the best possible effects upon French Art. Some six or seven years ago the Sar Peladan inaugurated the Salon de la Rose-Croix, which in aim and effort rather resembled the defunct Grosvenor Gallery, allied to the better draughtsmanship and technique of the French school. The result was the discovery of such men as Armand, Point, Séon and Knopff. The works of Watts and Burne-Jones exhibited at the Paris Exhibition of 1889 also helped greatly this new art movement in France. Ruskin and Morris were read and translated, and a distinctly fresh movement took place among the decorative arts resulting in the creation of a new department devoted to decorative art exhibits in the two yearly salons. White enamelled and green ash furniture was imported from England, and became extremely fashionable in Paris. The art fabrics of Liberty became popular and were imitated by the Louvre and the Bon Marché, while such new French houses as Jeanselme's Modern Styles in the Rue Royale and Bing's Art Nouveau in the Rue de Provence cropped up everywhere.

Submerged Towns. TRADITION speaks of many submergences of populous places and history records the existence of towns which have long since been overwhelmed by the encroachment of the sea, notably Great Meols on the Cheshire coast and Dunwich the capital of East Anglia in the time of the Heptarchy. Modern necessities have led to the deliberate sinking of some hamlets. Seven years ago a village was hidden under the waters of Lake Vyrnwy, the great reservoir constructed by the Corporation of Liverpool to supply that city and its suburbs with pure water from a sequestered valley high up among the mountains of North Wales. The valley itself, which involved the creation of a most beautiful lake, and not simply taking possession of one, afforded a splendid site for a reservoir, since it was originally the bed of a lake cut out by a glazier, and filled up in after ages by accumulations of rock, washed down by the rains, until it became dry land. The conversion, however, necessitated the entire submersion of the village of Llanwddyn, with its parish church dating back to the Elizabethan period, a Wesleyan Chapel, and the Powis Arms Inn and two other public-houses, the dwellings of from forty to fifty inhabitants; also Eunant Hall, the seat of Sir Edmund Buckley, near the head of the lake, and a bridge or two over the River Vyrnwy. The Liverpool Corporation purchased 13,000 acres of land on the high ground in the neighbourhood, and there erected a new village, with parish church and chapel, for the ejected inhabitants, also reverently removing the dead to a new churchyard. A very similar undertaking is now in progress at Caban Coch, some twenty miles to the south, where a reservoir to hold 200 million gallons of water for the supply of Birmingham with pure Welsh water is being constructed. This reservoir has also necessitated the building of a new Baptist Chapel, to replace one which will be submerged higher up in the Elan Valley, and again bodies have had to be removed from an old churchyard and re-interred.

German Excavations in Greece. IMPORTANT excavations at Palatia, in Asia Minor, a village built on the site of the ancient Miletus, were commenced last October under the auspices of the Royal Museum of Berlin. Great things are expected by the German archæologists from this mission, though this ground is anything but virgin soil to the excavator; the British Museum holds a series of seated statues, of a very archaic type and of high importance in the study of early Greek art, which were discovered by the late Sir Charles Newton on the sacred way leading from the sea coast to the ancient shrine of the Didymæan Apollo, near Miletus; and the mission headed by Baron Edmond de Rothschild brought home many years ago the extensive and finely-preserved remains, now housed in the Louvre, of the later Ionic Temple of this divinity erected there, which almost rivalled in size, elaboration and splendour of decoration the second Temple of the Ephesian Artemis on the same coast—both these temples immeasurably surpassed the Doric Parthenon in extent and in profusion of decoration and sculptural adornment, though they could not compete with it in subtlety and rhythmic elegance of proportion or in sovereign beauty of style.

Coffin Slabs at Crediton Church, Devon. IN the south transept of Crediton Church, placed in an upright position against the south wall, is to be seen the large coffin slab shown in the accompanying illustration. It measures 6ft. 4½in. long and is 4½in. thick, its section being flat with a double hollow moulding at the side and ends. That on the right side is broken away. A raised simple floriated cross, standing on three steps of unequal height, occupies nearly the entire length of the slab. The other coffin slab illustrated is a fragment bearing traces of a raised floriated cross of more elaborate design and of the wide hollow moulding which enriched the edges of the complete stone. The fragment stands against the outside face of the east wall of the same transept, and is 4ft. long and 4½in. thick. The slabs removed from their original positions, by far the oldest monuments in and around the church, appear to date from the twelfth century, and doubtless marked the resting place of some distinguished ecclesiastic belonging to the early church. The dotted lines show the portions broken away. The drawings are by Mr. A. L. Cox.



MEASURED AND DRAWN BY A. L. COX.

Excavations in Rome. THE church of St. Maria Liberatrice in the Forum, which was wedged in between the roots of Caligula's palace and the temple of Castor, has been purchased for about 375,000 lire. The history and name of this church take us back to almost Pagan times, and in the mediæval days it was known as St. Maria dell' Inferno. This title originated in an early legend of a dragon whose pestilential breath killed all who came that way, but which was finally slain by St. Sylvestro. According to an ingenious and probable surmise of the late G. B. di Rossi, this dragon may merely have personified the Pagan fire-worship of the Vestals, which reluctantly succumbed to the powers of Christianity. The Vestal temple was situated within a stone's throw of the church. Whether this was the actual case or not is not provable. Nevertheless, the ancient springs of Juturna, which are situated almost beneath it, have at various periods caused pits and pools to form thereabouts by reason of subterraneous erosion of the tufo-rocks. Whether hot springs emitting vapour have made themselves temporarily aggressive on any of these occasions we are not told. One might almost venture to suggest a new idea, and question whether the pestilential breath of the dragon may not have been in reality that of the then lost-sight-of "Cloaca Maxima," which, unknown to the mediævals, was running below their feet hard by, though perhaps now and then choked with rubbish.

Correspondence.

CLERK OF WORKS EXAMINATION.

To the Editor of The Builders' Journal.

Bowes Park, N.

Sir,—In further reply to your correspondent, "King Frost" (see p. 340 of last week's issue), there is an examination for Clerks of Works, held annually in June, by the Worshipful Company of Carpenters, in which there is no age limit, but it is practically restricted to carpenters, as a day's work in that craft forms one of the items in the examination. All particulars can be obtained from the clerk to the company, Carpenters Hall, London Wall, E.C.—Yours truly,

G. ELLIS.

"QUANTITIES AND QUANTITY TAKING."

To the Editor of The Builders' Journal.

Tunbridge Wells.

Sir,—Your reviewer of this book by Mr. Davis suggests what he calls a very good plan of "taking off." I have not seen Mr. Davis' book, but may I suggest what is for many purposes an excellent method, namely, "taking off" floor by floor and clearing out every trade before going to the next floor. This may be a little longer than some methods, but it has many advantages, two of which are that the "taking off" can be done by two men (one begins at the roof the other at the basement) and that the dimensions for any particular item being *all together*, their omission, if necessary in adjusting variations, is most easy and complete.

It seems that there are a number of methods of "taking off" different parts of work that might be altered with much advantage. For instance, linings of whatever width (to doors, windows, &c.) should be measured run. This is much better than measuring super, and perhaps better than measuring bead and rebate and groove to frame, &c. This method obtains in the North and is a better one than used by many London surveyors.—Yours truly,

H. B. JOHN, P.A.S.I.

PRESIDENT KRUGER'S HOUSE.

Exeter.

Sir,—The description of the above house, given on page 341 in your issue for last week, is not strictly accurate from an architectural point of view. The lions at each side of the main entrance are not of stone but of marble, and are not at all bad copies of Landseer's well-known lions at the foot of Nelson's column in Trafalgar Square, though considerably under life-size (they are about 4ft. from out to out). They are fixed, facing each other, upon common wooden pedestals, which detract a good deal from their dignity.

The President's residence is situated on the outskirts of Pretoria, five or six minutes' walk at the outside, from the central square of the city. It stands nearly flush with the footway, which, immediately in front of the actual house, is paved with terra-cotta slabs. There is no other paving near, so that the sole approaches are either all mud or all dust, according to the season of the year.

Kruger's actual residence is a low one-storied stuccoed building painted white, covered in with the usual corrugated-iron roof, low in its central ridge, but rising and terminating with a slightly elevated gable at each end. There is a narrow and continuous varandah running the full length of the front. The garden is only a few yards wide, and is separated from the roadway by a low fencing of painted wood. It is pleasantly shaded by a row of tall eucalyptus and blue gum trees. It is under the verandah, or stœp, where the President (like all Boers) sits in his hours of leisure; and there I had coffee with him little more than a year ago. The look-out, from there, is very rough and ready; the roadway is much as nature left it. A few poor homesteads are built on either side of the Presidents' house, whilst in front all is a dreary waste, save that a particularly ugly chapel has been erected immediately in front of the presidential edifice. This chapel is of red brick with local stone dressings and is covered by an iron roof, the ridge of which is capped here and there by huge bulb-like ventilators of zinc, most ungainly and unsightly to the eye. Right in front, thrusting itself most obtrusively almost into the road, is an uncouth tower and spire of zinc. In the former is a clock with its face painted a particularly ugly blue. This clock has no hands. Telegraph and telephone wires galore run past Mr. Kruger's house attached to the iron telegraph poles (there are no wooden telegraph posts in South Africa); but I noticed his residence was not connected by either telegraph or telephone.

A few minute's walk past the President's house is the cemetery where our soldiers who died, or were killed, in the siege of Pretoria in 1880 are buried. Their memorials, like those of all our soldiers I saw in South Africa, are in a forlorn and neglected state.—Yours obediently,

HARRY HEMS.

SEWAGE PURIFICATION WITHOUT FILTRATION.

To the Editor of The Builders' Journal.

London, E.C.

Sir,—We have read with great interest the paper on the above subject in your issue of December 27th, by Mr. W. Kaye Parry, M.A., A.M.I.C.E., and with your permission should like to hear more in detail the arguments supporting the statements made by the author as to the superiority of the oxygenizing system by chemicals over that of intermittent filtration through biological beds, more particularly as regards the relative cost.

In our experience, we have found the latter system more effective and less costly, both at first and for maintenance, than any system where chemicals have been used.

For the last eight years we have been dealing with sewage purification in small installations, such as are required for country houses or villages, and have used chemical precipitants, the small amount of sludge and mineral detritus being easily separated and disposed of.

The first cost of these installations has been so heavy, owing to expensive apparatus required for raising sludge, and applying chemicals, that we have adopted the biological system on account of its lower initial cost and greater efficiency. This apparently has not been the experience of the author of the paper, who said, "that additional evidence was still needed to show which was the most economical method."

It is possible to put down a set of biological beds at about 25 per cent. less first cost than a chemical plant dealing with the same quantity of sewage; a better effluent is produced, and there are these additional advantages—the biological beds fill, stand, and empty automatically, the only attention required being the occasional removal of mineral deposit and paper from the catch-pit; there are no chemicals required; there is *no sludge*; and no perceptible fatigue has been found in the beds in four years.

As far as it is possible to judge from present experience, the beds may reasonably be expected to last for ten years; should they fail then, or even sooner, the cost of removing the material, washing and replacing it, is small when spread over the life of the beds.

As regards comparative cost, it may be taken that the land required is equal in both systems. The catch-pit for mineral deposit, the screen for removing paper, and the tanks are also necessary in both; leaving the cost of filling material in the biological system to set against sludge—pressing and removal, chemicals, and their application to the sewage.

At Sutton, the average working cost per million gallons treated by chemicals and broad irrigation, is £15 11s. 11d., as against £3 19s. 0d. by biological treatment; if interest on first cost be added to the latter, at the rate given for Manchester, namely, £1 11s. 7d., a balance of £10 1s. 4d. per million gallons still remains in favour of biological treatment.

The author states (presumably referring to the Adney system) that "the cost of purchasing and applying a suitable oxygen carrying compound would not amount to more than one-third of this sum," *i.e.*, £1 11s. 7d., divided by three, or, say, 10s. 6d. per million gallons!

If this system produces an effluent, that will be allowed to flow into the Thames or its tributaries, above the intake of the water companies. At a cost, including capital charges and maintenance, of 10s. 6d. per million gallons of sewage treated, we hope that Mr. Parry will make public in your columns some further particulars, for the benefit of those engaged in the solution of what may fairly be called the problem of the present.—Yours faithfully,

HENRY OUGH and SON,
A.M.I.C.E., A.R.I.B.A.

ALTERATION WORK.

To the Editor of The Builders' Journal.

London, W.C.

Sir,—I think the larger number of members of our profession will hardly agree with A. H.'s reply to the query of E. S. E. (Blackpool), published in your issue for December 27th, 1899. If the contractor has worked correctly to the architect's drawings, and the pilasters in execution appear comparatively insignificant, the client could in no way expect a concession in price, either from the builder or the architect, as it is quite a question of design and opinion, and as such is a matter entirely within the province of the architect to decide, more especially, as I take it, that the client has seen and approved of the drawings at or previous to the signing of the contract.—Yours faithfully,

C. ORLANDO [illegible]AW.

To the Editor of The Builders' Journal.

London, W.C.

Sir,—With reference to the above letter, the expression "comparatively insignificant" does not convey the point involved in E. S. E.'s question, which stated that the pilasters appeared insignificant, "compared with those adjoining." In our answer we replied that if the contractor worked to the drawings he was in no way responsible, and in this our correspondent agrees. We differ from him in thinking that the architect would not be responsible. The reason he gives is that it was a question of design and opinion, and entirely within the province of the architect to decide, adding, "more especially, as I take it, that the client has seen and approved of the drawings at or previous to the signing of the contract." This latter fact, if it be one, is not stated in the question, on which alone our opinion was asked and given. No doubt the matter was one of design and opinion, and entirely within the province of the architect; but if his design was so faulty that when it was carried out the result was so unsatisfactory that the work had to be done over again in a different way, does our correspondent really consider that the architect incurs no responsibility for having made so defective a design? Surely he ought to have known that the pilasters which he designed would, when executed, look insignificant compared with those adjoining. If he did not, he must either have failed when making his design to take account of the surroundings, and thus been guilty of grave neglect, or he must have been unable to foresee the effect of his design when carried out, and thus exhibited a serious want of skill. If he did know that the pilasters which he designed would, when executed, appear insignificant compared with those adjoining, does our correspondent think he ought to have so designed them? If so, we fear he has an erroneous conception of what a trader is entitled to expect from an architect whom he employs to design a new shop front. Certainly the last thing he either expects, or is entitled to expect, is that his new shop front is to look unnecessarily mean or insignificant beside his neighbour's on either side. It is the architect's business to bear this in mind, and reconcile it with the requirements of art. If he fails to do so the client has just right to complain. We do not think that even if the client saw and approved of the drawings it would make much difference. He could not be expected to foresee what the effect would be when finished. He had not the skill to translate, so to speak, the language of the design into the expression of the completed work, and while he approved of the design on paper, he was not necessarily estopped from disapproving of it when reproduced in stone or wood.

This discussion, however, is probably altogether beside the actual facts of the case. The question says:—"Contractor does not give sufficient projection in head, but *otherwise* works to drawings." It would appear, therefore, that according to the drawings the proper amount of projection was given, and that the contractor failed to give the proper amount of projection, because he neglected to work to the drawings. We have in our answer dealt with this alternative, and we adhere to our answer in this and in every other particular.

Yours faithfully, A. H.

LAST YEAR'S ART.

THE past year has shown a sudden and quite unexpected improvement in the general demand for artistic productions. At the Academy, where for some time past the record of sales had been steadily dropping until in 1898 it reached the insignificant total of £13,730, a marked advance was noted, and sales to the amount of £21,670 were announced. Other exhibitions, too, enjoyed a spell of acceptable prosperity and artists generally found the conditions of their profession distinctly more favourable. It was significant, however, that with very few exceptions the works sold were those comparatively low in price and that collectors showed no eagerness to become possessed of large and ambitious productions. At the same time, there has been no diminution in the willingness of picture buyers to pay heavily for the works of deceased masters; pictures by famous painters have sold readily, and have been keenly competed for.

The special exhibitions of the year have been numerous and important. The beginning of the year witnessed a veritable boom in Rembrandt. The collection of 208 of the master's pictures at Burlington House was closely followed by the display of his etchings at the British Museum. These were in every way two memorable events. Scarcely less so was the New Gallery Exhibition of Burne-Jones's pictures, in January. Every work of any note by the great English romanticist was included save the remarkable "Briar Rose" series, which could not conveniently be removed from the architectural setting for which it had been designed. In the spring Turner and a few of his contemporaries were adequately represented at the Guildhall; and at the Grafton Gallery a living painter who has made a reputation all over the world, M. Verestchagin, claimed attention. Abroad the most important shows were the Van Dyck Exhibition at Antwerp and the Velasquez Exhibition at Madrid.

Two events that will have in the future a marked effect upon the art progress of the country took place during the past twelvemonth. One was the final decision of the Government to proceed with the completion of the South Kensington Museum, and the laying, in May, of the foundation stone of the new buildings by the Queen. The other was the opening of the new rooms which two years before the late Sir Henry Tate had undertaken to build so as to make perfect his gift of the building at Millbank which is officially styled the National Gallery of British Art. Some years must elapse before the extension of the Victoria and Albert Museum, as the South Kensington Museum is henceforth to be called, is available, but the year 1899 will be memorable as having seen the commencement of an undertaking most necessary and yet inexcusably delayed.

Decorative art showed, to the encouragement of all concerned in its welfare, increased signs of vitality. The exhibition of American and French Applied Art at the Grafton Galleries in the summer served to introduce Mr. Louis Tiffany to his brethren on this side of the Atlantic. The Arts and Crafts Exhibition at the New Gallery, which came later, has by now passed into the company of hardy periodal shows that London brings forth. Together these exhibitions served to show the widespread renaissance in decorative design, and the mutual ties which bind the craftsmen of this country to America and to the Continent. One cannot avoid the conclusion, though it savours of insular partiality, that our designers are superior to their foreign contemporaries, and owe less to them than they give. The reflection of English ideas in Continental designs illustrates this fact. Round the St. Paul's Cathedral decorations a fierce controversy raged a few months ago. It led to a few minor alterations in the work in progress, but caused no radical change in the policy of the Decoration Committee. In all main essentials the decorative principle adopted at the outset by Sir W. B. Richmond remains unaffected, and his designs for the mosaics are being consistently carried out.

The Royal Academy has made several additions to its roll of members. Four new Associates were elected during the year: Mr. Alfred East, a landscape painter; Mr. A. S. Cope, a portrait painter; Mr. Goscombe John, a sculptor; and Mr. Aston Webb, the well known architect. An Honorary Foreign Academician was also added, M. Jules Breton. A serious loss, however, was sustained by the Academy in the death of two Associates, Sir Arthur Blomfield and Mr. Harry Bates. Several other deaths among artists have occurred, though happily the English school has suffered less than in recent years. Two men and one woman of European reputation have fallen out of the ranks of art—James Maris, Giovanni Segantini and Rosa Bonheur.

Professional Practice.

Acton.—The new Passmore Edwards library which has been erected from designs by Mr. Maurice B. Adams was opened last week by the American Ambassador (the Hon. Joseph H. Choate). The building is a rendering in red brick and stone of the English Renaissance, with large mullioned windows and pedimental projecting pavilions, emphasising the façade rising above them, with a gable having for its prominent feature a boldly-detailed circular window. All the public departments, including the book reading room, 50ft. by 30ft.; the lending library, 45ft. by 38ft., having a counter over 30ft. long, with bookstall, gallery and librarian's office; the book store; magazine room, 25ft. 9in. by 21ft.; and the reference room, about 28ft. by 24ft., are situated on the ground floor, and open out of a central hall. The first floor is utilised as the librarian's residence, comprising drawing-room, three bedrooms, kitchen and offices, with a house-yard in the basement, and cellar. The roof is covered in green slates and a wrought-iron finial rises above the canted bay of the magazine room. Sculptured figures flank the entrance and support the corbels which carry the columns above. These, and the carving on the exterior, were executed by Mr. Nathaniel Hitch. The wrought-iron fence and gates, which together form a conspicuous ornament round the library, were carried out from the architect's drawings by Messrs. Hart, Son, Peard and Co., whilst the oak fittings and furniture were made by Messrs. W. Johnson and Co., Wandsworth. Mr. Marcus Smith, Churchfield Road, Acton, supplied the gas fittings after the architect's details; the wiring for electric lighting has been carried out by Mr. George Cockburn, of Ealing, and the quarry glazing by Messrs. Aldam, Heaton and Co., of Bloomsbury. The builder is Mr. Sidney Powell, of Bedford Park. The cost has been £6,610, towards which Mr. Passmore Edwards contributed £4,000. There are at present nearly 10,000 books in the library, which, however, provides accommodation for double that number. The lending department comprises about 7,000 books, including a juvenile library of 900 volumes, and, in addition, a collection of musical works. The reference library contains about 3,000 volumes.

Burton-on-Trent.—The Burton-on-Trent Artisans' Dwellings Company, Ltd., are busy erecting houses on their estate at Horninglow, to fulfil the want of suitable dwellings for the working population of Burton-on-Trent. Sixty of these houses will shortly be ready for occupation. The accommodation consists of a living room 12ft. by 12ft., having a wooden floor and cooking range; a kitchen 11ft. by 9ft. 3in., with tile floor, copper, fireplace and sink, and a pantry leading therefrom; two bedrooms are provided, one 15ft. 6in. by 12ft., the other 11ft. by 9ft. 3in., each being properly ventilated and containing a fireplace. Complete privacy is secured for each tenant by a separate passage entrance for each pair of houses, the back yards being subdivided by brick division walls. The out-offices comprise w.c., coal-house and ashes-place. South Staffordshire water is laid on to each house, and the drainage system is well ventilated and disconnected from the main sewer. A garden 50ft. to 63ft. long is provided for each tenant. There are also in course of erection other houses having five rooms of somewhat larger proportions, the fifth room being an extra bedroom. Up to the present, estimates for 133 houses have been accepted, the contractor being Mr. Henry Edwards, of Blackpool Street. The architect for the work is Mr. Thomas Jenkins, of 35, High Street.

London.—Next to the "Palace of Henry the Eighth and Cardinal Wolsey," at the top of Fleet Street, a new bank has been built for Messrs. Barclay, Bevan and Co. The site was formerly occupied by Messrs. Gosling and Sharpe's bank premises, which were very old and covered the ground previously occupied by the Golden Dragon, the Crown, the Wheatsheaf, the Three Daggers, and Gun-in-Hand Alley. The sign which hung over the inner door of the old building is being carefully preserved in the new premises, which have been built of Portland stone in the Italian Renaissance style. Every modern convenience has been provided, and electric light has been installed throughout. The structure has been erected, at a cost of £25,000, from the designs and under the superintendence of Mr. Arthur C. Blomfield, M.A., the son of the late Sir Arthur Blomfield, A.R.A. The latter held for many years the post of architect to the Bank of England, and Mr. Blomfield has now suceeded him in that appointment.

A new block of buildings comprising four shops and nearly seventy offices has been built on the west side of Chancery Lane. It covers an area of 6,000ft. super. and is in the Tudor style, the façade being of Portland and Beer stones. Fireproof construction has been observed throughout, and much care has been bestowed on the lighting arrangements and the ventilation. The architects were Messrs. Waterman and Lewis, of 7, Cullum Street, Fenchurch Street, and the contractors were Messrs. Dolman and Co., of Poplar, E.

On January 4th the new St. George's Hall and schools which have just been built in the Old Kent Road, Southwark, by the South-East London Mission, were formally opened. The new hall, which is the outcome of about twenty-five years' missionary effort in one of the most densely-populated districts of the metropolis, has cost altogether considerably over £12,000. Of this sum about £11,000 has already been subscribed, the City Corporation having for the first time in the history of Primitive Methodism contributed 100 guineas. In order to raise the greater portion of the amount, however, the Rev. J. Flanagan, the minister in charge, has, during the past two years, travelled over 35,000 miles, conducted fifty-six special missions, and preached and lectured over 700 times. The late Professor Banister Fletcher was the architect of the building, the chapel of which seats over 800 persons, there being in addition five minor halls

Keystones.

The Central Hall of Varieties, North Shields, was destroyed by fire last week.

Pymme's Park is the latest suburban park. The Edmonton District Council acquired it for £36,000.

A new Town Hall at Tunbridge Wells is a scheme now receiving the consideration of the local authorities.

The Ancient Southern Wall of Chulmleigh Parish Church has been taken down and restored, as the foundations were found to be faulty.

Mr. G. L. Watson, D.L., J.P., of Rockingham Castle, Northamptonshire, died last week. He was an authority on Norman Architecture.

In the new Public Hall at Halifax, now approaching completion, an organ is to be erected at the expense of Miss Elizabeth Porter. The cost is £2,400.

Keighley Hospital is to have an additional pavilion for scarlet fever cases. Messrs. John Judson and Moore, the former architects, will be consulted about the work.

A Technical Institute and Public Hall at Colne is to be built in Albert Road at a cost of about £9,400. This sum is about £600 under the original estimate.

Woodcock Street Baths, Birmingham, are to be extended by the addition of a first-class swimming bath and private baths for men, at an estimated cost of £9,000.

New Market Hall, Leeds.—At their last meeting the Leeds City Council authorised the Markets Committee to proceed with this building, which is estimated to cost £80,000.

Wesleyan Church Building in London.—£100,000 has been expended during the past year on new Wesleyan churches in London, and £40,000 on mission premises. Thirty other churches are contemplated to be built.

A new Infirmary at Liskeard Workhouse has been built from the designs of Mr. Sansom, architect, by Messrs. Hobbs and Bartlett, contractors, of Linkinhorne. The cost, including furnishing, has been about £5,500.

Hexham Abbey Restoration. — Mr. Thomas Spencer, of the Newburn-on-Tyne steelworks, has promised to build the nave of the church at a cost of £15,000, and Mr. James Hall, of Dilston Castle, has promised to rebuild the old Lady Chapel at a cost of £10,000.

New Baths for Accrington.—The Baths and Library Committee of the Accrington Corporation have instructed the surveyor to prepare plans and estimate for the erection of baths, with stone front, adjoining the Salvation Army Barracks in St. James's Street, the swimming bath to be 70ft. long by about 30ft. wide.

A Tax on Hoardings.—The Works Committee of the Dundee Town Council has decided to levy charges on hoardings in public streets at the rate of from 4d. in the suburban to 1s. 6d. per superficial yard per month in the central district. It has also been agreed that no hoarding shall be used as an advertising medium except under special conditions.

Aberdeen Town Council.—At the Council meeting on January 3rd, it was resolved to obtain an additional 700 horse-power engine and dynamo for the electricity works, at an estimated cost of £6,325. The Workmen's Dwellings Committee reported that they had fixed the commission to be allowed to the architects in connection with the additional houses be erected under the Workmen's Dwellings Act at 3½ per cent. on the amount of the contracts accepted, with a further commission of 1½ per cent. being allowed for the preparation of the schedules of quantities. Plans for new workshops at the police stables, Poynernook Road, were approved, and it was remitted to the Cleansing Committee with powers to have the work carried out, at an estimated cost of £3,612.

Mr. Kidson Swales, a member of the firm of Messrs. Frederick Jackson and Co., decorators, Leeds, was buried on Friday last.

A French Poster Competition.—It is reported that the municipality of Paris is considering a proposal to offer prizes for wall posters.

Mr. Mortimer Menpes is leaving England immediately for South Africa, where he intends painting a series of pictures of incidents connected with the war.

St. Matthew's Church, Buckley, Flintshire.—For building a chancel to this church, in memory of the late Mr. Gladstone, Miss Helen Gladstone and Mrs. Drew have intimated their intention to give £1,000.

Gifts to Assuan Church.—The Queen has signified her intention to present a font to the new church at Assuan, Upper Egypt, which is to be consecrated on January 28th. A marble floor for the chancel and a lectern have also been promised.

Mr. Thomas Collins, J.P., who was five times mayor of Tewkesbury, died last week. He was widely known on account of his connection with the restoration of Tewkesbury Abbey, which was greatly improved by his generosity. The deceased, who was in his eighty-second year, was head of the firm of Collins and Godfrey, builders, Tewkesbury and Cheltenham.

The Art School at Bushey, which is carried on under the active supervision of Professor Hubert Herkomer, R.A., has recently amended its constitution, with the view of establishing itself on a more permanent basis, and has obtained powers to largely increase the number of its members. These amendments came into force on January 1st, when the new term commenced.

Cartwright Memorial Hall, Bradford.—We understand that tenders for the erection of the Cartwright Memorial Hall in Lister Park, Bradford, are about to be invited. Since the plans were accepted they have been in the hands of the quantity surveyors, who have now completed their part of the work. It is not likely that any further delays will occur to prevent the actual starting of building operations in the early part of the Spring.

New London Park.—On Wednesday last the Ilford District Council decided to spend £11,000 for laying out a new park at the Green Lane end of the district. This makes the fourth park the Council have decided on during the past year, but inasmuch as the growth of the district has been enormous, the Council think they are justified in their action. During the last ten years the assessable value of Ilford property has increased from £60,000 to £200,000.

Art Gallery for Bristol.—Sir William Henry Wills has offered to double the offer he made last summer of £10,000 towards the establishment of a municipal art gallery for Bristol, provided that the Corporation supplies the balance of £10,000 to make up the total expenditure—£30,000. A committee has been appointed to consider the best means for carrying out the proposal. The site of the Gallery would be that at present occupied by the Salisbury Club buildings.

Municipal Fire Insurance.—The committee of the Glasgow Corporation appointed to report on a system of municipal fire insurance propose that a fire fund shall be established as provided for by the Act, and into it shall be paid all premiums received from departments for the property covered, and out of it shall be paid all losses arising from fire and damages resulting therefrom, fire brigade charges, expenses of management, and all other expenses incidental to the department. Also, that a reserve fund shall be established to the amount of £30,000. On the occurrence of a fire the loss and damage shall be fixed and determined by a valuer to be appointed by the Corporation. A table of the suggested departmental contributions to the reserve fund shows the amounts covered by companies to be £1,453,116, the premiums paid £2,771, departmental contributions to reserve fund £30,000, and reserve fund on hand £7,433.

The new Church of St. David, Exeter, is now completed.

A Yiddish Theatre is proposed to be erected in the East End of London.

Ornamental Shelters at Leeds are proposed to be erected, at a cost of £253 each, on the Bramley, Stanningley, Rodley, and Wortley recreation grounds.

The new Underground Reservoir on Park Hill, Pontefract, has been tested and found to be watertight. The work will be completed very shortly.

Hull Town Hall Scheme.—At the monthly meeting of the Hull City Council held on Wednesday last, the report of the Property Committee recommending the extension of the town hall at an estimated cost of £120,000 was adopted. Some particulars of this scheme were given on page 334 of last week's issue.

R.I.B.A.—At a business meeting of the Royal Institute of British Architects held on Monday evening last the following gentlemen were elected Fellows:—Mr. Herbert Baker, Cape Town; Mr. Frank Gatley Briggs, of Blackburn and Liverpool; Mr. John Murray, of London; and Mr. Harry Vernon Wolstenholme, of Blackburn and Liverpool.

Explosions due to Heated Electric Cables. — A somewhat strange explosion occurred in Manchester on Friday last near the Royal Exchange due to a breakdown of an electricity main owing to a crowbar being driven into another main near. This created gases from the heated rubber which exploded. The city officials have lately been removing old underground rubber-covered cables, which are liable under some conditions to overheating, and it is expected that the new cables now being laid will be entirely free from danger.

Art Bequests to Liverpool.—The will of the late Mr. H. F. Hornby, of Liverpool, has been proved at nearly £159,320. He directed that his executors should in due time offer to the city authorities his art library and collection of engravings, autographs, etc., on condition that they shall be kept as a separate collection for the use and benefit of the art-loving public of Liverpool. In the event of the Corporation agreeing to this, he further bequeathed to the city a sum of £10,000 towards the cost of a building in which the collection could be housed.

Furness Abbey: A Discovery. — On Friday last the excavations in progress at Furness Abbey disclosed some important and interesting facts regarding the early settlement of Cistercian monks in Furness. Below the present sacristy, on the east side of the north transept, there were found the walls of an early Norman apsidal chapel, the first building erected by the Cistercian monks in Furness. Adjoining and east of the foundation was a solid mass of human bones 3ft. thick. The bones have lain in the present site for over 400 years, but are well preserved.

A Remarkable Discovery has been made by Dr. Peters, who has recently been excavatting at Nippur, an ancient city of Babylonia. While the workmen were clearing away the *débris* from the walls of the temple of Bel, they discovered in a hole which had been closed up with sun-dried bricks a large goose egg on a mat of reeds. Why the egg was placed there is a mystery, as it has no connection with any known Babylonian custom. The temple was built at a very remote time, probably in the reign of Akur-gal (B.C. 2,200) or even earlier, so that the egg is over 4,000 years old.

A Lesson to Jerry-Builders.—Exemplary punishment for jerry-building has been meted out by one of the parish correctional courts at Paris. A house in the Rue des Appenines collapsed some time ago during construction, killing eight workmen and injuring nine others. An inquiry showed that the disaster was due to the erection of the premises being faulty, and that inferior materials were used. The architect and masonry contractor have each been sentenced to eight months' imprisonment, and two ironworks contractors to two months' imprisonment each, and all four have, in addition, been ordered to pay damages to the relatives of the men who were killed.

A Wagner Theatre for Berlin is proposed to be built.

The Restoration of York Minster is to be proceeded with.

New Board Schools at Neath have been built at a cost of £10,700 from designs by Mr. J. Cook Rees. Mr. David Jenkins, of Swansea, was the contractor.

Manchester Housing.—At their meeting on Wednesday last, the Manchester City Council decided to purchase 237 acres of land at Blackley on which to erect workmen's cottages.

Bridge over the Tugela.—The Patent Shaft and Axletree Company have succeeded, after keen competition with American firms, in securing a Government order to send out immediately a new bridge to cross the Tugela at Colenso, evidently to replace the old one, which has now been finally destroyed by the naval guns. Seven spans are required, and, needless to say, the work has to be carried out with the utmost despatch.

New Patents.

These patents are open to opposition until February 13th.

1898.—Driving Gear.—26,600. J. SMITH and G. SCRUTON; both of London. In endless block tackle, pulleys are employed which have a half-round groove in the centre of their edge, in which are half-sunk holes at suitable intervals. The chain consists of a wire rope on which metal balls are fixed at corresponding distances apart. The balls may be fixed on by placing the rope in a chilled bullet mould and pouring in the metal.

Wood-working Machines.—27,049. T. SHURMER, Bolton. At the bottom of a vertical spindle driven by a belt is a rotary cutter; the vertical movement of the spindle can be controlled by means of a weighted lever. Below the cutter is a double table. The bottom portion may be fixed by a clamp or may be rotated by hand or power, and the upper part slides across the face. To this upper table the work is secured, and it will be understood that considerable range is obtainable by this arrangement. Different cutters are attached for different kinds of work. The machine can also be used for shaping metal.

1899.—Examining Tram Rails, &c. 2,714. F. J. EDGE and W. MANGNALL; both of Manchester. This is an apparatus for testing tram rails or other surfaces to see how they are wearing. It consists of a rectangular frame supported by feet which may be swivelled out of position when not required. This frame is filled with thin slides, which extend in a row from one side to the other, run in grooves, and are prevented from falling out by wires. The instrument is placed on the rail (the feet supporting the frame clear) and the slides naturally fall and indicate by their upper ends the shape of what is below. They can now be clamped in this position and a tracing taken from the contour which they present.

Electric Floats: Footlights.—2,742. E. W. BOWLES, London. Immediately behind the facia of the stage are secured angle irons which have, at their inner ends, hinged cover pieces. The reflector consists of bent sections secured to the angle pieces by thumb-screws, and being pierced with holes for the electric lamps or gas jets. The lampholders and connections are below. When the lights are on, the hinged cover pieces (which may be white enamelled on the underside) are lifted back and lie flat on the stage. When the lights are out, the covers are put back. By these means it is claimed that the reflector can be easily removed for cleaning, dust is kept out, the lamps are protected, and no light is lost in the socket.

Varnish Manufacture.—2,848. A. J. SMITH, London, S.E. A mixture of purified linseed or similar oil and gum, such as cowrie or copal, is heated to about 300deg. Fahr. in a closed vessel provided with a safety valve and pressure gauge. The heat and pressure are maintained for several hours, and the contents are then allowed to cool, the necessary quantity of turpentine and driers being added in due course. As the vessel is closed, there is no escape of vapour, causing loss or nuisance.

Sink, Bath, and other Discharge Valves.—3,066. J. SHANKS, Barrhead, N.B. The plug is disc-shaped, has a rubber rim, and is connected by a chain with the hinged, perforated cover of the overflow. This latter extends down the back of the sink or bath and empties into the outlet just below the plug. The overflow is integral with the body. A modification is included in the invention.

Plugs or Wedges for securing Flashings.—3,210. Mr. J. CURTIN, Victoria, Australia. The wedge consists of a piece of metal bent up to form an incomplete tapering tube, provided with a point at one end and a rounded head to receive the blows by which it is driven in between the joints. The wedge holds the flashing tightly beneath it, and may be filled in afterwards with cement or mortar.

Locks and Latches.—3,350. F. W. LOCKLEY, King's Norton, Worcs. In an upright lock a spring bears against the latch bolt, and below this is a guide (which slides up and down) carrying the follower, a spring being provided at the bottom. As the door is closed the latch is pushed back and slides on the top of the follower. When it is closed, however, the follower slips into a notch or recess in the latch bolt, and is held there by the bottom spring and guide until the lock handle is operated. Above the latch is a lock. The advantage claimed is, that the arrangement allows very narrow locks to be made, suitable for doors having narrow stiles.

Fireplaces.—19,658. R. W. BOYD, London, W. A hot closet or oven of iron or other metal is provided above the fuel, at the top of the fireplace, and is heated by the fire, or, when there is no fire, by a spirit lamp supported on a movable bracket. Plates, food, &c., can be kept in this oven.

Fire Extinguishing Appliances.—20,099. F. B. POWERS, Chicopee Falls, U.S.A. The hose is wound on a reel that works on a spiral stem of the water valve extension. On one side it has projecting lugs. When required, the hose is taken hold of and dragged to the fire outbreak, and, as it is unwound, the reel turns and travels on the screw towards the water valve until its lugs come in contact with the projections on a wheel, which opens the valve and lets in the water. There is thus no waste of time in obtaining a water supply. The whole apparatus is connected up and is supported on the wall.

The following specifications were published on Saturday last, and are open to opposition until February 20th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—26,558, MONTGOMERY-MOORE and PRESTON, apparatus for closing and opening bulkhead and other doors. 26,628, GOODWIN, acetylene generating apparatus. 26,713, WATSON, DURELL and MILLER, water-closet valves. 26,902, PARYCZKO and LITYNSKI, device for heating the contents of baths.

1899.—630, EDWARDS, pumps. 754, JACKSON and WITHINGTON, door fastenings. 982, GORRINGE, stoppering varnish, oil, paint cans and the like. 1,184, HITCHCOX, dust cover and shoot suitable for a cart or waggon to avoid dissemination in the removal of house and other refuse. 2,139, SQUIRE and SQUIRE, swing joint or movement for mirrors, windows, ventilators, &c. 2,411, BINNY, water distiller, feed water purifier, and make-up apparatus for hot water and steam supply and warming installations. 2,413, BINNY, swing radiators. 2,434, J. DUCKETT and SON, LTD, and DUCKETT, gulleys or traps for downspouts. 2,757, RESTALL, apparatus for jointing and repairing drain and other pipes. 2,930, MAY, means for consuming smoke. 3,096, CROMPTON and CHAMBERS, collapsible core bars for use in casting metal pipes, columns, cylinders, &c. 3,099, FISHER, heads of Venetian blinds. 3,219, SUCCIE, blind fixtures. 3,333, TATTERSALL, ventilating fans. 3,337, PURDY and HINDLEY and Co., LTD., road paving. 3,460, MORRIS, apparatus for cutting tiles and the like. 3,522, FREEMAN and OLD, attachment of sash and analogous lines to window and other frames. 3,903, PILKINGTON, machinery for rolling sheets of glass. 3,970, DETSINYI, method of heating and process of manufacturing a suitable preparation therefore. 4,054 BOULT (*de Lasserve*), acetylene gas generators. 5,408 GREEN, chimney tops for preventing down draught. 13,674, DE SCHODT, apparatus for use in incandescent gas lighting and heating. 13,911, STEVENSEN, combination latch and alarm lock. 14,816, BAYLEY, acetylene lamps. 14,948 SHAW, gas lamps and lanterns. 17,457, STURGIS, window blinds. 17,830, FAIRBAIRN, green-houses. 18,241, CERVENKA, incandescent gas lamps and burners. 18,262, FÖRSTER, method of and apparatus for the casting of tubes, pipes, and other articles of regular form and of considerable length. 18,381, MILLS (*A. B. Dick Company*), duplicating apparatus. 18,787, OWEN, manufacture of artificial stone. 18,945, GRUENDLER, tiled boards or blocks for floors, ceilings, frames and the like. 19,769, VON DE WEHL, fastening device. 20,255, GRISMER stage appliances. 20,423, MURINICK, incandescence gas burner. 20,930, DE BRUYN, artificial building stone. 21,401, SCHMIDT, joiners' clamps. 21,963, FINK, building blocks applicable for cavity walls. 22,415, STERKEL, brushes. 22,467, COHEN, manufacture and decoration of mouldings for picture frames 22,514, MURPHY, means for locking nuts. 22,626 EVANS (*Hopkins*), breakwaters, river bank facings, or protections, &c. 22,671, ADAMS, seat action closets. 22,678, STARK, nut locks. 22,722, KESSEL, gas stoves. 22,884, KEMNITZ, construction of ceilings and walls for buildings and other structures. 22,890, BARTH, collapsible or folding ladders.

New Companies.

Halton's Wood Brick Company, Limited.

This company was registered on December 22nd by Ashwell and Co., 79, Queen Street, E.C., with a capital of £5,000 in £1 shares, to acquire certain land forming part of Trafford Park, Davyhulme, near Manchester, and to carry on the business of brick, tile, pipe, pottery, earthenware, terra-cotta and ceramic ware manufacturers, &c. Registered without articles of association.

Forthgain Quarries, Limited.

This company was registered on December 23rd, by Drake, Driver and Leaver, Limited, Rosebery Avenue, E.C., with a capital of £25,000 in £1 shares, to search for quarry, work, make marketable and deal in stone, lime, cement, &c. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers. Qualification, £200. Remuneration as fixed by the company.

Church Stretton Building Co., Ltd.

This company was registered on December 30th by Goddard and Aldridge, 6, Old Serjeants' Inn, E.C., with a capital of £20,000 in 1,960 £10 ordinary shares and 400 £1 deferred shares, to acquire houses and property in Salop, and to carry on the business of builders, timber merchants, sawyers, woodworkers, &c. The first directors (to number not less than three nor more than seven) are G. H. Dorrell (chairman), Hon. G. E. Hill-Trevor, T. F. Kynnersley and Robert H. Pitcairn. Qualification, £100 ordinary and £5 deferred shares. Remuneration, one guinea each per board meeting attended (12 guineas for the chairman). Registered office: 18, Adam Street, Adelphi.

The death is announced of Mr. Alfred J. Baker, of the firm of Baker and Sons, auctioneers, of 11, Queen Victoria Street, E.C. He was one of the pioneers of the system of building-plot sales.

COMING EVENTS.

Wednesday, January 10.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Paper by representative of Glasgow Architectural Association. 8 p.m.

SANITARY INSTITUTE.—Council Meeting at 5 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION. — Council Meeting at 7 p.m., and Students' Evening.

Thursday, January 11.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Arthur Thomson, M.A., M.B., on "The Anatomy of the Human Form: The Upper Limb."

SOCIETY OF ANTIQUARIES OF LONDON.—Ballot for election of fellows. 8.30 p.m.

Friday, January 12.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. E. Guy Dawber, A.R.I.B.A., on "The Cotswold Country." 6.45 p.m.

INSTITUTION OF CIVIL ENGINEERS. (Students' Meeting).—Professor T. Claxton Fidler, M.I.C.E , on "The Theory of Structures and Strength of Materials." 8 p.m.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. H. F. Bladen on "Structural Work in Theatre Auditoriums." 8 p.m.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Lewis F. Day on "Ornamental Design.—II." 11.30 a.m.

ARCHITECTURAL ASSOCIATION.—Mr. Arthur Bolton on "The Dome as the Basis of an Architectural System." 7.30 p.m.

Saturday, January 13.

DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE AND ART.—Visit to Perth. 12.45 p.m.

Monday, January 15.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

Tuesday, January 16.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Annual Exhibition of Drawings at Alpine Club, Savile Row. Open till January 27th.

Wednesday, January 17.

SURVEYORS' INSTITUTION.—Students' Preliminary Examination—First Day.

BIRMINGHAM AND DISTRICT CLERK OF WORKS AND BUILDERS' FOREMAN'S ASSOCIATION. — Mr. H. Price, A.R.I.B.A., on "House Drainage." 8 p.m.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.—Annual Meeting of the members at 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. Algernon Barker, B.A., on "Legal Topics of Interest to Architects and Surveyors." 7.30 p.m.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Meeting at 8 p.m.

Thursday, January 18.

SURVEYORS' INSTITUTION.—Students' Preliminary Examination—Final Day.

SOCIETY OF ARTS.—Meeting of Indian Section.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Arthur Thomson. M.A., M.B., on "The Anatomy of the Human Form : The Upper Limb."

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Visit to the Hydraulic Installations as Somers Town Goods Depôt, and Kentish Town Locomotive Sheds, of the Midland Railway, where a new American Goods-Engine will be inspected. 2 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABINGDON.—For the erection of a hospital for the Joint Hospital Board. Mr. J. G. T. West, architect, Abingdon:—

Kingerlee and Son ...	£6,887	Walden and Cox	£5,821
Musselwhite and Son	6,298	Brasher and Sons ...	5,755
J. Grant	5,987	J. Buckle, Abingdon*	5,150

* Accepted.

BRIGHTLINGSEA (Essex).—For the supply and laying about 3,430 yards of water mains, for the Urban District Council. Mr. H. Goodyear, engineer, Colchester:—

W. Griffiths ...	£1,950 0 0	Lewellen and Co.	£1,540 19 11
Chandler and Sons	1,860 12 5	Manders, Leyton*	1,423 1 11

THE "TRANSBORDEUR" BRIDGE AT ROUEN.

CROSS-RIVER COMMUNICATION.

AN INGENIOUS SYSTEM.

On the eastern bank of the river Usk at Newport, Mon., there is a large tract of land which is about to be greatly developed by being divided by roads, provided with railways, and covered with buildings, and, in connection with the last, it may be stated that Messrs. John Lysaght, Ltd., the well-known firm of iron founders and engineers, have large works at present in course of construction on a portion of the area. In a comparatively few years, therefore, the east bank will have a large population. At present there is only one public means of crossing the Usk at Newport—the bridge near the Castle; but as this is a considerable distance from that part of the town which fringes the docks, it has become imperative to provide other means of crossing the river nearer its mouth.

With this object in view many schemes have been promulgated during the past thirty years—one was to erect a travelling carrier something like that at Brighton and Rottingdean; another was to have a steel arch carrying moving platforms on its haunches, the platforms being hauled over the arch by mechanical power; others were for a high level bridge (to be approached by a spiral roadway at each end), a bascule bridge like the Tower Bridge, a swing bridge, and a drawbridge with a central opening 200ft. wide. Finally, two schemes were left for consideration, a vehicular subway and a "transbordeur" bridge. When the cost of the former was ascertained (it worked out at £770,000) the proposal was hastily shelved, and the result is that the remaining one has been at last decided upon, and in the coming session of Parliament powers will be sought to enable the bridge to be erected—its cost is estimated at £65,000.

The "transbordeur" is the invention of a Frenchman named M. Arnodin, of Chateauneuf-sur-Loire, and possesses several peculiar features. Bridges of this description have been built at Bilbao, Rouen, and Bizerta (Tunis), and are in contemplation at Bordeaux, Nantes, Antwerp and Havre. At the present time there is no bridge of this kind in the United Kingdom. A general view of the Rouen bridge and an underview of the one at Bilbao are given as illustrations to this article.

The essential parts of this system are:—(*a*) A horizontal railway supported by a bridge spanning the channel or river to be crossed at such a height as will allow the tallest-masted vessels to pass underneath; (*b*) A car or frame mounted on rollers or wheels running on the railway previously mentioned, and so arranged that it may move freely in a longitudinal direction quite close to the bridge platform; (*c*) A carrier or platform of suitable dimensions suspended from the car or frame by steel rods or ropes, and hung at the level of the quays or banks, but above high-water mark. It will thus be seen that the bridge is nothing less than a gigantic travelling-crane.

The car or frame is arranged to run freely over the rails in both directions at pleasure, and, as the carrier or platform is suspended from it, the carrier can be hauled or drawn from end to end of the bridge or from side to side of the channel at the will of the person controlling its movement. The suspension rods carrying the platform are crossed or arranged in triangles so as to form an elementary kind of trussing, in order to prevent any swinging motion which might result from the pressure of the wind or from the longitudinal movement of the car or platform. The motive power may be obtained from cables driven by gas, steam or electricity. In the latter case it is preferable to place the motors on the movable car or frame. Whatever kind of power is employed it is essential that it should be under complete control, and capable of instantaneously reversing the motion of the car and working it in a backward or forward direction at will.

The use of electricity as a motive power dispenses with the necessity of employing men to drive a steam engine, and the working expenses are thus reduced to a minimum, as the conductor or attendant in charge of the suspended carrier can control its motion by means of suitable switch gear fixed on the platform itself. At Newport it is proposed to obtain the necessary electrical energy from the central supply.

The proposed structure consists of two steel towers on the eastern and western sides of the river, that on the west side being situate on portions of the Brithdir and Waterloo Wharves, a suspended girder spanning the river between the towers, and two anchorages. The towers are carried to a height of 250ft. above the river banks, and the suspended girder to a height of 170ft. above high-water mark, ordinary spring tides. The clear span between the centres of the saddles on the towers is 635ft. The suspension cables are carried a distance of 450ft. inshore to anchorages consisting of massive blocks of masonry, each about 40ft. square. The foundations of the towers are carried down to the marl underlying the alluvial deposit in the bed of the river by cylinders 20ft. in diameter filled with cement concrete, there being four cylinders to each tower or pier. A platform or deck 90ft. by 45ft. is formed at the base of each of the towers on the level of the river banks. The tower or pier on the west side projects 55ft. from the river bank. The wharves project 65ft. from the river bank. The tower or pier on the east side projects 70ft. into the river. The car will not project into the river, a special bay being provided in the bases of each tower to receive it while being loaded.

The carrier or travelling platform is 32$\frac{3}{4}$ft. long by 39$\frac{1}{8}$ft. wide, of which width two spaces of about 6$\frac{1}{2}$ft. on each side would be set apart for passengers, the remaining portion being available for vehicles. The weight of the car and its appliances would be about 39$\frac{1}{4}$ tons, and it would be capable of carrying as a constant load about 35 tons, or about 500 people of average weight. The test load would be about 19$\frac{1}{2}$ tons in addition, making a total rolling load of 94 tons. Under the influence of this load, coupled with the stress due to a wind pressure of 25lbs. to the superficial foot on all the exposed surfaces of the structure, and 12$\frac{1}{2}$lbs. on the portions at the back of those directly exposed, the stress set up in any part would not exceed one-fourth the ultimate resistance or breaking strain of the metal employed. This is within the limit allowed by the Board of Trade, 6$\frac{1}{2}$ tons per square inch for mild steel of good quality, though the wind pressure is less than that provided in the Board of Trade regulations for railway bridges. The allowances for wind pressure may, however, be modified in the final design for the "transbordeur."

The time occupied in crossing the river would be one minute.

The Rouen Bridge has a span of 467ft.

the height of the girder is 164ft., and of the towers 221ft., while there are twelve suspension cables. The car is 42ft. 6in. long and 36ft. wide, is suspended from thirty cables, and is driven by two 25-h.p. electric motors. It weighs 45 tons, and the load is 15 tons; but experimental loads of 100 tons have been carried across in safety. The car can be stopped and reversed in two seconds. The current is conveyed by an under-running trolley, not unlike that used on an electric car, and is carried through an insulated cable to a series parallel controller fixed in the pilot house on the car, and thence to the motors. The suspension cables and the bridge itself form the return circuit. The bases of the towers are electrically connected to the tram rails by copper cables, so as to form an efficient return. The bridge at Rouen was used to carry electric tram cars across the river, so that tramway passengers might cross from one side of the city to the other without changing their seats; but this practice has now been discontinued.

Besides the advantage of being able to convey vehicles across the river, a bridge erected on this principle affords a ready means of carrying workmen across at a quick rate; at Newport it is estimated that whereas they could be taken across in one minute on the "transbordeur," it would take them five or six minutes to walk through a subway. It might be mentioned that the River Usk at Newport varies from 400 yards to 150 yards. The width at the point of crossing is 240 yards.

In conclusion we must acknowledge our indebtedness to Mr. Robert H. Haynes, the borough engineer of Newport, through whose courtesy and kindness we have been able to give the above particulars and to publish the accompanying illustrations.

Workmen's Compensation in 1899.

DURING the past year the section in the Workmen's Compensation Act that applies to employment on, in, or about any building which exceeds 30ft. in height, &c., has given the Court of Appeal some trouble. The following points have been decided:—Where there is a roof, the height of the building is to be measured to the top of the roof, not to the top of the upright walls (*Hoddinot* v. *Newton*). The Act does not apply in the case of a building intended to exceed 30ft. in height that has not, at the time of the accident, reached that height (*Billings* v. *Holloway*). But the limitation as to 30ft. in height is to be read with the words which follow it in the section—"and is either being constructed or repaired by means of a scaffolding, or being demolished;" and consequently the Act applies to employment about a building on which machinery is being used for the purpose of construction, though the building is not 30ft. in height (*Miller* v. *Tompkinson*). The provision in the Act by which the accident to the workman must arise out of, and in the course of, his employment has been the subject of many decisions.

In *Holness* v. *Mackay* it was held by a majority of the Court of Appeal that where a workman engaged by a contractor to do work on a railway was killed on that railway in going to his work, the accident did not arise out of and in the course of his employment. But the case would be different where the accident happened on premises over which the employer had control. Compensation cannot be obtained for an injury attributable to "the serious and wilful misconduct of the workman." In order to estimate the average earnings of a workman for the purpose of assessing compensation payable to him, or, in case of his death, to his dependents, the period of employment must be continuous. If there is a break, the average earnings are to be calculated on the period subsequent to it (*Jones* v. *Ocean Canal Company*), and short absences do not always constitute a break (*Price* v. *Marsden*). In the case of a workman's death, only his dependents wholly or partly dependent on his earnings at the time of death, are entitled to compensation (*Simmons* v. *White*).

LONDON HOUSING PROBLEM.

MR. FRED KNEE, general secretary of the Workmen's Housing Council, recently wrote to the Marquis of Salisbury, Mr. Balfour, and Mr. Ritchie, in reference to the housing problem in the metropolis, pointing out that the London County Council was only too anxious to minimise the existing difficulty by providing cheap, sanitary, and suitable dwellings for the working classes, but that they found that any rebuilding scheme within its administrative area was foredoomed to failure on account of the gigantic expense involved, and that they had consequently turned their attention to the possibility of erecting suitable blocks of buildings on some of the open spaces which surround the county of London, with the result that they had been brought face to face with the grave question whether they possessed powers to acquire land outside the area under their control.

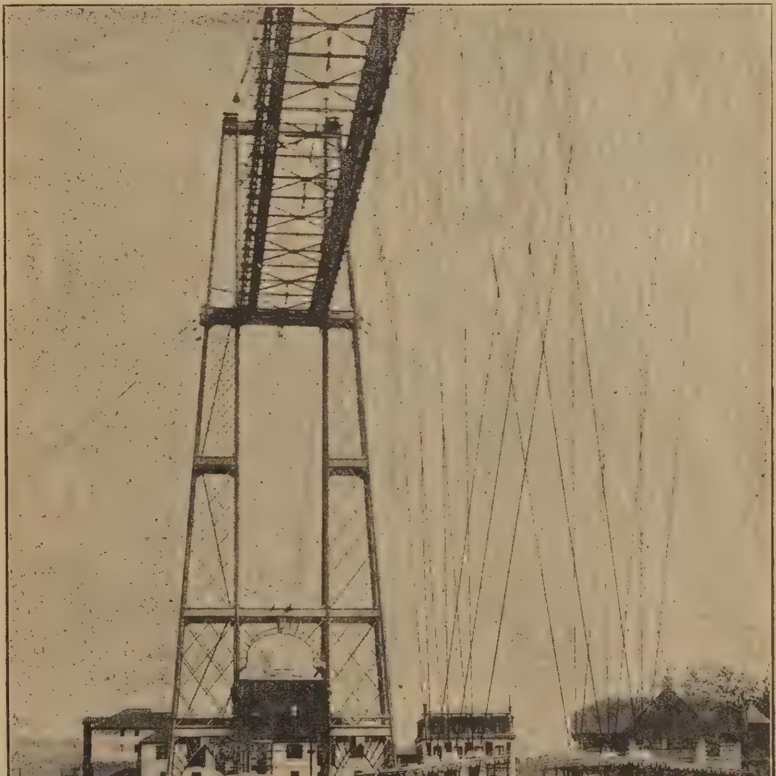
Lord Salisbury says he fully appreciates the grave importance of providing cheaper and better houses, and in far greater numbers than has hitherto been done, to meet the still rapidly growing demand of working men in London for suitable dwellings within a reasonable distance of the localities in which they are obliged to work. At the same time he has not yet satisfied himself as to the best means by which this provision can be made. He promises to give the matter his earnest attention, and should a feasible scheme present itself he sees no reason why it should not be carried out, to the great advantage of the community in general, and the working classes in particular.

Mr. Balfour says he is fully aware of the need for increased and improved housing accommodation for the working classes in our great towns. He has not yet, however, seen any scheme that would satisfactorily meet the requirements of the case. He is watching the present agitation on the question with great interest, and can promise to give any proposals that are made his personal attention.

Mr. Ritchie regrets that the various local governing authorities of the country have so far made little use of the powers conferred on them by Parliament by the Act passed in 1890. He is of opinion that, had such bodies utilised the powers then given to them to the best advantage, much more might have been done to obviate the present congestion of our great cities. At the same time he is prepared to watch the development of present proposals, and should any scheme arise which seems to promise an amelioration of the present evils he will support it.

The Workmen's Housing Council, while fully appreciating the advantage of ministerial co-operation in its campaign, has decided that, if necessary, an amendment calling attention to the housing problem shall be moved when the Address in Reply to the Queen's Speech at the opening of the next session of Parliament is under discussion. Several members of Parliament have already promised to take this step should it be necessary.

Purifying the River Avon.—A poll of the city of Bristol is proposed to be taken with regard to the scheme for taking the sewage out of the river Avon.



"TRANSBORDEUR" BRIDGE AT BILBAO, SHOWING CAR.

Builders' Notes.

A Bridge over the dangerous ford at Broom, near Alcester, is to be built at a total cost of £3,100. Towards this sum £1,250 has been voted by the Warwickshire County Council, while £700 has been promised by the Alcester Rural District Council.

Work Abroad.—In a circular which we have received from the Emigrant's Information Office, 31, Broadway, Westminster, S.W., it is stated that there is a demand for men engaged in the building trades in Western Australia, Tasmania, and New Zealand.

Workmen's Compensation: A Painting Case.—Some time ago David Bradley, a painter, was standing on a scaffold painting some steel bars, at a height of about 50ft., when he fell and sustained such injuries that he died. On December 27th Sheriff Spens, in the Glasgow Sheriff Court, found compensation for the widow for £235. The defendants were the deceased's employers, Messrs. Hobbs and Samuels, of Glasgow.—His Lordship, in a note, said that the question was whether painting fell under the employments covered by the Act—a question of fact, not of law. The work in which deceased was engaged was constructive, and in no sense decorative work. The paint deceased was putting on the steel bars was to prevent the moisture of the atmosphere from affecting them, and it was more necessary in the case of steel than in the case of iron. The defendants, in his opinion, were "undertakers" in the sense of the Act, being persons engaged in undertaking construction repairs or demolition, and he therefore decerned as above.

A Street Case under the London Building Act.—In the case of Armstrong v. London County Council (a special case stated by the magistrates and heard before the Lord Chief Justice and Justices Bigham and Darling) the appellant appealed against the decision of the magistrates convicting him for having commenced to form and lay out a street for carriage traffic without having first obtained the sanction of the Council, pursuant to Section 7 of the London Building Act, 1894. The question was whether the carriage-way proposed to be formed by the appellant would, when formed, be a street within the meaning of Section 7, and the magistrates found that it would. The facts are as follows:—The appellant owns some land adjoining a public carriage-way called the Grove, which communicates by a carriage-way 15ft. wide with the Highgate Road. Appellant intended that the street should run from the Grove through the site to, and to communicate with a footway upon, Parliament Hill; but the respondents refused their sanction because the proposed street would not afford direct communication between two streets formed and laid out for carriage traffic. The appellant then proceeded with the work (which included the pulling down of some old houses and the erection of twenty new ones, approached by a carriage-way from the Grove) without seeking the sanction of the respondents. Drainage plans for the buildings were submitted to the vestry of St. Pancras. It was for the occupants of the buildings only and for tradesmen and others visiting them that the carriage-way was to be used. The question in this case turned upon the true construction of Section 7. Would the way which the appellant had commenced to lay out and form be, when formed, a "street" within the meaning of that section? The justices thought that it would, and the fact that, after proceeding straight for a certain distance, it continued inside or around the proposed square, did not make it any the less a street. It seemed clear that it was not less a street because it was intended to be used as a private way, for the interpretation section (5) in no way so limited "street." They were clearly of opinion that the appellant had commenced to form and lay out a street within the meaning of Section 7, and as he did so without having obtained the sanction of the respondents he committed the offence of which he has been convicted. The appeal would, therefore, be dismissed with costs.

British Institute of Certified Carpenters.—In the report for session 1899, it is stated that it has been decided to print an annual journal giving items of interest relating to the Institute and papers read at its meetings. There is at present a balance in hand of £27 12s. 5d. The present president is Professor T. Roger Smith, F.R.I.B.A., who succeeds the late Professor Banister Fletcher. The Institute was founded in 1890, and its address is, Carpenters' Hall, London Wall, E.C.

Messrs. Julius Sax and Co., Ltd., electrical engineers, of 119, Coldharbour Lane, Camberwell, S.E., send us a copy of their new calendar, which represents an electric bell. Messrs. Sax claim to be the oldest and best manufacturers of the English variety of these instruments. They have lately been reorganising their business, and are now adding further machinery to cope with the increasing amount of Government work which they have been fortunate enough to obtain. They inform us that they will be glad to send a copy of their calendar to any of our readers who will communicate with them.

Masters and Men.

The Plasterers of Bradford, it has been agreed, shall receive 9½d. per hour. They had asked for 10d. per hour, and the masters offered 9d., a compromise being ultimately agreed to.

Grave Building Crisis at Edinburgh.—A very grave crisis has arisen in the building trade at Edinburgh, and two firms have had to suspend payment. One of these is probably the largest firm of speculative builders in the city, and liabilities are understood to be of very large amount.

Wages in Switzerland, Italy, and Austria.—In Switzerland the rates of wages vary greatly. In the iron, steel, and other metal trades, wages vary from 2s. 4½d. to 4s. 9½d.; a few reach 5s. 7d.; the major portion vary from 3s. 2d. to 4s. per day. Woodworkers, 2s. 4d. to 4s.; building operatives, 2s. 4d. to 4s.; a few 4s. 9d. per day. In Italy wages are low—building operatives, 2s. 6d. to 3s.; engineers, all under 3s. In Austria, ironworkers, from 1s. 5d. to 4s. 1¾d., according to the district. Engineers of various branches range from 2d. per hour to 1s., inclusive of overtime, but only 44 reach that limit, 37 reach 8d. per hour, and 127 only 7d. per hour; all others are under 6d. per hour.

Parliamentary Labour Representation.—A conference of representatives of the Trade Union Congress, the Social Democratic Federation, the Independent Labour party, the Fabian Society and co-operative societies will take place at the Memorial Hall, London, next month to consider how the cause of labour representation in the House of Commons may be most effectually promoted. The first resolution to be submitted will be in the nature of a preamble, declaring the desirability of working-class opinion being represented in the House of Commons by men sympathetic with the aims and demands of the labour movement. To this end it is proposed to organise the different agencies which have hitherto pursued the same object on independent lines. A resolution will be moved that an executive committee be appointed, consisting of ten or twelve representatives from trade unions, four from the co-operative societies, two from the Fabian Society, two from the Independent Labour party and two from the Social Democratic Federation. The units of this body are to be elected by their respective organizations. The functions of this committee, so far as they have been outlined, will be to keep in touch with trade unions and other organisations, local and national, which are running labour candidates, so that there may be no overlapping, and that united effort may be concentrated to the best advantage. The administration of funds will also fall to the responsibility of this executive. It is intended that the representatives on the committee should hold themselves responsible to the Trade Union Congress and other bodies by whom they are nominated.

A Leeds Building Dispute.—At the meeting of the Leeds City Council last week on the presentation of the minutes of the Lighting Committee the question of a dispute between the building labourers and a firm to whom it was proposed to let a contract arose. The question was dealt with at the December meeting of the Council, when it was referred back to the Committee; since this meeting the Committee has had an interview with the Labourers' Union, but had not been able to quite understand the bearings of the question as between the men and the masters. They therefore again asked that the minutes recommending the acceptance of the tender of the firm to whom objection had been made should be confirmed. They had invited the Masters' Association to meet them, in order to try and clear up the point that had arisen.—Mr. Connellan, in renewing his amendment of a month ago, that the matter should be referred back, said that the firm in question claimed to pay one section of the labourers below the standard rate of wages for excavating work, and he was of opinion that by the settlement of 1896 no distinction could be drawn between one class of work and another. The rate of payment was 6½d. per hour, and there was an endeavour to use the Corporation as a lever to lower the rate of wages.—Mr. Wilson could not agree with Mr. Connellan's definition; there were two classes of labourers in this particular trade—the bricklayer's labourer and the navvy.—The amendment was eventually withdrawn on it being pointed out that the Committee were pledged to inquire into the matter and would see there was no shirking of the fair contract clause.

Trade and Craft.

BRUSHES.

That articles of the best quality are the cheapest in the end is a truism that has proved its value to many who would otherwise desire to employ second-quality goods. This will be found especially the case with brushes, for it is false economy to buy cheap brushes, meaning of course by the word "cheap," brushes that are not of the best quality. Messrs. G. B. Kent and Sons, of 75, Farringdon Road, London, E.C., have a reputation as manufacturers of good brushes for all kinds of painting and similar work. In the preface to their new catalogue they state that every pattern has been very carefully calculated, and, considering the standard quality of their brushes, they feel confident that no better value is obtainable. The prices given are this time subject to alteration without notice, as there is reason to fear that the top prices for bristles have not been reached. It is hardly necessary to say that Messrs. Kent make brushes for all kinds of work, both large and small. In the red sable hair varieties prices have dropped materially owing to an alteration in the fashion for furs, and this is a good example of the relation that exists, sometimes most subtly, between fashion and trade. In addition to brushes, Messrs. Kent supply blow lamps, knives, and all painters' requisites. It is a fitting compliment (showing in what estimation it is held) that they have reprinted from that excellent publication "Specification," at the front of their catalogue, a number of hints on the selection, care, and treatment of brushes for painting and decorative work.

Chatham Town Hall will be opened by Lord Rosebery on January 23rd. The building has just been completed at a cost of £30,000.

Surveying and Sanitary Notes.

Two Lady Sanitary Inspectors for West Ham are to be appointed.

High Street, Kensington, is proposed to be widened to about 60ft. to the east of Church Street.

The Chicago Drainage Canal, which was described in our issue for December 27th, has now been opened.

Duns Lane, Leicester, is to be widened to 50ft. for a considerable distance (though it will still be 43ft. in one portion) at an estimated total cost of about £11,000.

A Manchester Improvement.—The Local Government Board have sanctioned the borrowing of £26,000 for the purchase of land in Whitworth Street and Sackville Street, near the Manchester Technical School, for an open space.

Leeds Street Improvements.—It has been decided to purchase property at a cost of about £15,000 to enable the following streets to be widened and improved:—Meadow Road, Jack Lane, Nile Street, Millshaw, Beeston, South Accommodation Road, Cross Lane, Farnley, and Town Street, Beeston.

New Streets at Coventry.—A new street is to be made to relieve High Street and Hertford Street. Little Park Street will be pierced just above the Mayor's house, the road will be crossed to a new thoroughfare to be made through the park, and exit will be in Eaton Road, near the railway station. A new street is also to be made from Gosforth Street, through Whitefriars, and to finish also in Eaton Road.

New Sewage Works at Keith are now completed, so far as the contractor, Mr. Roderick Mackay, of Aberdeen, is concerned, and will shortly be opened. Messrs. Jenkins and Marr were called in about three years ago, and formulated a scheme; the outfall disposal of the sewage has presented many difficulties. The sewer is carried along the banks of the Isla, and at several places, the ground being of a very soft nature, has had to be supported by concrete walls and piping.

Sanitary Inspectors' Association.—In the course of his New Year's address on Saturday last, Sir Hugh Gilzean Reid, the president, condemned the arrangement by which there was a Board of Examination for Sanitary Inspectors which did not include one of their order. They were prudently promoting a Bill in Parliament to define the technical qualifications and to fix definitely the tenure of office of sanitary inspectors, objects which he held were vital to their professional position.

Sanitary Inspectors.—The following have been elected as the Executive Council of the South Wales and Monmouthshire Sanitary Inspectors' Association for the ensuing year:—Messrs. Llewellyn Davies, Swansea; W. Fraser, Llandaff and Dinas Powis; W. J. Hopkins, Barry (Port); W. J. Hughes, Rhondda; J. Preece James, Tenby; David Jenkins, Cardiff (Port); James Jones, Gelligaer and Rhigos; Spencer E. Jones, Newport; W. Lloyd Marks, Rhymney; John T. Owen, Merthyr; J. Towy Thomas, Rhondda; David Vaughan, Cardiff; T. W. Warren, Cardiff; and W. Williams, Rhondda.

Open Spaces.—At the monthly meeting of the Metropolitan Public Gardens Association held last week, Lord Teynham in the chair, it was stated that the City Corporation were introducing a Bill next session to enable Finsbury Circus Garden to be opened to the public. Progress was reported with regard to schemes for securing the churchyards of Christ Church, Blackfriars, and of St. Giles's, Camberwell, Marion Square, Bethnal Green, Albert Square, Commercial Road, and vacant sites at Shadwell and at Sumner Road, Camberwell. It was reported that the committee for securing an addition of forty-two acres to Brockwell Park upon which the association was represented, had now secured promises of £15,000 from the Lambeth Vestry, £6,000 from the Camberwell Vestry, and £1,500 from the Newington Vestry; the total sum required is £72,000.

The Public Health during 1899.—The following table shows the death rate during the past year for the thirty-three great towns:—

Birkenhead	19·2	Liverpoo	26·4
Birmingham	20·8	London	19·8
Blackburn	18·9	Manchester	24·6
Bolton	19·9	Newcastle	20·6
Bradford	18·4	Norwich	17·3
Brighton	19·0	Nottingham	20·2
Bristol	18·2	Oldham	20·5
Burnley	19·6	Plymouth	21·7
Cardiff	15·5	Portsmouth	19·7
Croydon	15·0	Preston	22·8
Derby	16·9	Salford	23·8
Gateshead	18·8	Sheffield	22·2
Halifax	18·3	Sunderland	21·5
Huddersfield	16·3	Swansea	18·2
Hull	19·3	West Ham	16·7
Leeds	19·2	Wolverhampton	21·9
Leicester	17·8	All	20·2

The Northwich Sewerage Scheme.—At the last meeting of the Northwich Urban Council a letter was read from the Local Government Board stating that, subject to the conditions that the pipe sewers would be surrounded with concrete where they were laid at a greater depth than 15ft., the Board would consent to the borrowing by the Urban Council of £25,000 for purposes of sewerage and sewage disposal in the Castle Ward. They, however, referred to the evidence given at the inquiry as to the urgent necessity for a proper system of sewerage and sewage disposal in the remaining portions of the urban district, and they urged the Council to take into immediate consideration, in consultation with their engineer, the question of dealing with these areas. The letter was referred to a committee.

The new London Improvement Bill, which the Council will promote in Parliament next session, includes the following expenditures:—The Thames Embankment extension and improvements at Westminster, £1,319,000; Mare Street, Hackney, widening, £660,750; Goswell Road widening, £227,800; St. John Street (Clerkenwell) widening, £92,400; Blackstock Road (Islington) widening, £5,200; Archway Road (Islington) widening, £6,000; Kentish Town Road widening, £10,450; Nine Elms Lane widening, £171,300; Camberwell New Road widening, £53,000; Harleyford Street (Lambeth) widening, £16,900; Streatham High Road widening, £194,200; widenings at Battersea Rise, Wandsworth Common, and Westhill, Wandsworth, £60,800; widenings at Blackheath Road, Blackheath Hill, Shooter's Hill Road, and New Road, £41,200; widenings at Lewisham High Road, Loampit Hill, Loampit Vale, Lee High Road, and Eltham Road, £86,500; High Street and Gardener's Lane, Putney, widening, £45,030; Maclise Road (extension to Hammersmith Road), £4,560; total, £2,995,090.

The Repair of Canal Bridges.—At the Stafford County Court last week Messrs. John Joule and Sons, Ltd., brewers, Stone, brought an action against the Staffordshire and Worcestershire Canal Company to recover £19 12s. as damages in consequence of the bad condition of a road, for the repair of which, it was alleged, the defendants were responsible. On August 5th a man in the employ of the plaintiffs was driving a brake down the slope from the canal bridge at Tixall, when the horse fell and was injured. The fall was due to the roadway giving way owing to the burrowing of rabbits. It was admitted that the accident occurred within 57ft. from the centre of the bridge; therefore the question for the judge was whether the Act of Parliament passed during the reign of George the Third made the canal company liable to repair the roadway on each side of the bridge from the points where the diversion had originally been made from the original road, the defendants disclaiming all liability except as to the repair of the structure of the bridge.—His Honour (Judge Mulholland) decided in favour of the plaintiffs' contention that the canal company were bound to repair the approaches to the bridge. Defendants' counsel then took the objection that an action for special damages would not lie against the canal company, and that they could only be proceeded against by indictment for the non-repair of the road. Plaintiffs' counsel while admitting that an action could not be brought against a highway authority for the non-repair of a road, contended that there was a distinction between a public body and a company which was established for the profit of the shareholders.—His Honour upheld the objection, and dismissed the action, but as the company had neglected to repair the road he did not give costs.

Engineering Notes.

Mr. Thomas Trewhitt, of Hutton House, West Hartlepool, died on Wednesday last at the age of seventy. He was the secretary of the Hartlepool Gas and Water Company.

Panama Canal.—It is reported than an American company has been formed, with a capital of thirty million dollars, to take over the Panama Canal works and complete them.

Mr. Richard Boyse Osborne, one of the most eminent civil engineers in America, died last week. He designed and built the first Howe truss-roof and bridges ever erected in Great Britain.

Proposed Damming of Niagara River.—A dam across the Niagara river to regulate the levels of the Great Lakes and their connecting waterways is provided for in a Bill which will be introduced in Congress.

Three Millions for Light Railways in Middlesex.—Sir F. Dixon-Hartland, M.P., chairman of the Finance Committee of the Middlesex County Council, estimates the cost of the Council's schemes for the construction of light railways within the county at £3,000,000.

Bolton Electric Tramways.—The electric tramway system at Bolton was inaugurated last week, cars running for the first time on seven of the ten routes constituting the system. There are about thirty-one miles of track, covering twenty-eight miles of street, and the system is one of the largest of its kind in England.

The Lighting of New York.—The Consolidated Gas Light Company announced last week that it had absorbed the New York Electric Lighting and Heating Company. This will make the Consolidated the most powerful illuminating company in New York, and will put it in a position to make a strenuous attempt to unite all the gas and electric light companies in the city.

Electric Lighting at Leigh.—Leigh is the latest municipality to adopt electric lighting. The installation has cost over £10,000, and is on the three-wire system, at a pressure of 440 volts. The charges are 7d. per unit for the first hour, and 2½d. per unit afterwards. A committee of Town Councillors have also under consideration the question of electric traction.

Successful Municipal Trading.—At the meeting of the Dover Corporation last week, it was stated that the municipal waterworks had yielded a profit of £3,500 on the year. This, together with a profit of over £2,000 on the municipal electric trams, is equal to a reduction of 1s. in the pound on the town's rates. The water is supplied at the rate of 10s. per annum per house of £20 rateable value, and so on in proportion. This is said to be the lowest water rate in the kingdom.

Electric Expresses between Manchester and Liverpool.—The Manchester and Liverpool Electric Express Railway Company seek powers, in a Parliamentary Bill, to construct a railway about 34½ miles long, commencing on the west side of Deansgate, Manchester, passing thence via Salford, Pendleton, Eccles, Widnes, Halewood, Garston, and Toxteth Park to its termination in Liverpool, near the entrance gate of the Bluecoat Hospital in School Lane. The capital required for the construction of this railway is £2,000,000, and electrical power is to be taken from a generating station in the parish of Great Sankey; the line will be constructed on the monorail system.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
	BUILDING—		
Jan. 12	Aberavon—Chapel	Primitive Methodist Trustees	F. B. Smith, Architect, Port Talbot.
,, 13	Kilkeel, Ireland—Masonic Hall	....	R. B. Wray, Kilmorey Arms Hotel, Kilkeel.
,, 13	Bawtry, Yorks.—Church Restoration	....	Boreham and Morton, 24, John-street, Sunderland.
,, 13	Guildford—Schools	School Board	A. J. Sturgess, 25, High-street, Guildford
,, 13	Huddersfield—Homes	Guardians	J. W. Cocking, Cloth Hall-street, Huddersfield.
,, 13	Llanrhaiadr-yn-Mochnant, Wales—Hall	Parish Council	D. Evans, Clerk, Oswestry.
,, 15	Grimsby—Workhouse Extension	Guardians	H. C. Scaping, Court Chambers, Great Grimsby.
,, 15	Drumshemuck (Ireland)—Farm Outoffices	....	R. Scott, 15, Willoughby-place, Enniskillen.
,, 15	Tunbridge Wells—Enlargement	Corporation	W. C. Cripps, Town Hall, Tunbridge Wells.

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

HAMMERSMITH-ROAD, W.—Important Building Site.—Preliminary Notice of Sale by Auction.—
Messrs.

CHESTERTON and SONS are instructed to SELL by AUCTION at the Mart, E.C., on THURSDAY, JANUARY 25th, 1900, at TWO o'clock, the valuable FREEHOLD PROPERTIES, Nos. 92, 98, 100, 102, 104, 106, 108, Hammersmith-road, together with Forty-seven Cottages and the Black Horse Beerhouse, in Brook Green-place at the rear, the whole forming an excellent building site of over 1½ acres. Also the valuable FREEHOLD INVESTMENT, No. 46, Brook-green.

Particulars of Solicitors, Messrs. MILLER, SMITH, and BELL, 3, Salter's Hall-court, Cannon-street, E.C.; Messrs. HASTIES, 65, Lincoln's Inn-fields, W.C; H. P. SMALLPIECE, Esq., Guildford; Messrs. SHORE and KING, Birmingham; E. F. DAY, Esq., Nos. 5 and 6, Clement's-inn, W.C.; and Messrs. CROWDERS and VIZARD, 55, Lincoln's Inn-fields, W.C. Auctioneers' Offices, 51, Cheapside, E.C., and 140, Kensington High-street, W.

SEASIDE LAND. — A FEW PLOTS remain on Seaside Estate to be LET on perpetual lease for erection of semi-detached houses. All hitherto erected have sold prior to completion. Finances arranged for Builders, if desired.—Address H. E. MOORE, Esq., Surveyor, 41, Bedford-row, London, W.C.

SOUTHALL, MIDDLESEX.—A very desirable Freehold Building Estate, comprising about 8¼ acres of land, now ready for development for the erecting of working men's residences, which are in great demand in the locality; this estate is only a short distance from the station, and frequent trains are run by the G. W. Railway Company to London at practically nominal rates to workmen, which has created a great demand for workmen's residences, for which this land is admirably suited.

MESSRS. GLASIER and SONS will SELL by AUCTION the above valuable FREEHOLD BUILDING ESTATE, at the Mart, Tokenhouse-yard, E.C., early in February, 1900, in One Lot.

Particulars and plan may shortly be had of Messrs. BURTON, YEATES, and HART, Solicitors, 23, Surrey-street, London, W.C.; and of the AUCTIONEERS, 7, St. James'-street, London, S.W.

To Land Companies, Builders, Speculators and others.

RAMSGATE.—Valuable Freehold Building Estate (a large portion of which has been already developed), extending from the High-road to Margate to the main road to Broadstairs, and having considerable frontages to numerous roads which are made, some kerbed, channelled, and taken over by the town, and comprise in all about thirty-one acres.

MESSRS. GLASIER and SONS will SELL by Auction, at the Mart, City, on Thursday, Feb. 1, 1900, at Two o'clock, in One or more Lots, the above very valuable FREEHOLD PROPERTY, known as the Dane Park Estate.

Particulars and conditions of sale, with plan, may be had of Messrs. KING and M'MILLIN, Solicitors, 39, Bloomsbury-square, W.C.; at the Mart, and of the AUCTIONEERS, 7, St. James'-street, S.W.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses. — For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum

Important to Architects.

It often happens that in addition to preparing plans for the erection of a public building or private house, an architect is called upon to carry out a scheme of interior decoration and furnishing.

In order that this may be done satisfactorily it is necessary to take into consideration the style to be adopted in relation to the architecture of the building treated, and also the schemes of colour and materials to be used in the decoration of surfaces.

Formerly the difficulty has been to find an authoritative publication which would be a reliable guide to those engaged in this branch of the profession, and one which would introduce new ideas for interior decoration in addition to keeping a record of all the novelties introduced by the manufacturers of furniture and fittings.

The proprietors of the "Builders' Journal" have therefore pleasure in directing the attention of the profession to their new monthly publication **THE FURNISHER,** *which deals exhaustively with all branches of the furnishing trades. This publication is divided into sections dealing with "Furniture and Upholstery," "Decoration," "Metal Work," "Lighting and Heating," "Pottery, China and Glass," and "Silver and Electro-plate." Each issue contains original designs and suggestions by well-known modern designers, and plates are given from time to time, with examples of the best work of some of the older schools. The journal is printed on superior paper, and illustrated in first-class style, and is worthy of the attention of all who have in any way to deal with the furnishing and decorating of public buildings or private dwellings.*

PUBLISHED ON THE 15th OF EACH MONTH.

THE BUILDING TRADES GIFT AND OURSELVES.

WE START A "B. J." FUND WITH 1000 SHILLINGS.

A SCHEME has been set on foot, and is already being prosecuted with vigour, for the erection at Bisley of a Home of Rest for discharged soldiers as a gift to the nation from the building trades. From the details of the scheme, which are set forth on page 364, it will be seen that contributions in kind are invited, and that many offers of building materials of one kind and another have already been received.

Obviously, however, there are many thousands connected with the building trades whose gifts could not possibly take that form, and it has been suggested to us by the promoters of the scheme that the starting of **a Shilling Fund**, in connection with this journal, would probably provide an opportunity for sharing in the national gift to many who are not in a position to offer building materials or to send a substantial cheque.

We gladly fall in with this suggestion and invite subscriptions ranging from 1s. upwards, which will be acknowledged in our columns, and forwarded in due course to the Treasurer of the general fund.

By this means all who are in any way connected with the building trades—architects, architects' assistants, draughtsmen, students, builders, clerks of works, foremen, workmen and apprentices—will be afforded an opportunity of taking their share in the national gift. The Proprietors of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD will start the list with a donation of **One Thousand Shillings** (£50).

Many of our readers have no doubt already contributed to one or other of the funds that have been organised for the benefit of our soldiers or their families, but we venture to hope that, if only by sending us a shilling postal order, they will take some share in this special and distinctive gift, and thus help to make it thoroughly representative of the building industries of this country.

Contributions for our Shilling Fund should be addressed to

SOLDIERS' HOMES FUND,
BUILDERS' JOURNAL,
Effingham House,
Arundel Street,
London, W.C.

Further details will be announced next week; meanwhile we invite correspondence on the subject from our readers.

Art in the Painters' Guilds.

SINCE in point of date they come earlier, the Flemish paintings at the New Gallery should be seen before the Van Dycks at Burlington House. To many they will be more interesting, and it would be a pity indeed if a collection made and arranged with such care should be overlooked. The South Room containing some rare and unique examples of English art at its best must be left for others to notice, while we talk of what painting there was in Belgium when painters, without exception, were guildsmen. A compact and scholarly paper by Mr. J. H. Weale on "Early Art in the Netherlands," introduces the subject and makes the catalogue itself of some value.

If the paintings, the critic must see, were reckoned in miles, there would then be some thousands on record; if in numbers, as many millions; and the consequence is that he feels every day less inclined to elaborate a description of any particular painting. If anyone were to give me such a thing as a little panel (No. 2 in this gallery) so that I could be alone with it during some part of each day, that would indeed be a different matter, but here with hundreds of paintings to talk of, and as many more to be seen, I can only say briefly and generally what attracts me to the arts of this period. It may seem that much of the work is mechanical, *naïf* to the point of absurdity, too assiduously laboured, and too realistic to approximate to one's ideal; all this may be said, and some more, while yet it remains most wonderful. A little knowledge of the conditions under which such things were produced, although nothing to boast of, is in fact indispensable, and thanks in this case are due to Sir Martin Conway for the chapter on the "Guild system" in his book on these artists. "The provinces of Flanders and Brabant were famous for their wealth throughout Europe." In the fifteenth century buyers and sellers from every land reverted to Bruges for their trade. "The representatives of twenty foreign princes dwelt within the walls of this capital of the rulers of Burgundy, at the cross-roads of the highways of the earth. Ghent, Louvain, Mechlin, Ypres, and other neighbouring towns were vast manufac-

DETAIL OF CHURCH OF ST. TROPHIME, ARLES. (*See p. 365.*)

turing centres. Louvain could muster 150,000 men, and at Ghent the weavers' guild alone numbered 40,000 men." The mind is prepared by such pictures of opulent cities for what remains to be said of the institutions they fostered, and amongst them the painters' guilds. One joins such a body to learn what its traditions are, what standard of work is maintained, and how much of oneself is *de trop*. The note of this guild-craft is thoroughness as to the work, and conformity with current ideas of fitness in the manner of treating the subject. It is known, though possibly not by all, that there were rules for the guidance of painters which, as early, at least, as the twelfth century, were embodied in a work called "Hermenia," consisting of two parts, the first merely technical, a digest of recipes; the second of regulations regarding the manner in which a story should be represented. [*E.g.*, one of some hundreds, *Elijah raises the widow's son.* "A high house. On the top a bed in which the child is laid. The prophet holds the child by its hand, and breathes into its mouth, the mother standing behind."] Given any such story, it may be taken for granted that the manner of treating it was settled at a comparatively early date, or a book such as this embodying the rules of the church in such matters would not have appeared when it did. [The latter part of this work is contained in Didron's "Christian Iconography," which, translated by Margaret Stokes and published in 1886, should be known to the English reader.]

So much for the subject. Then as to the manner of painting, there was but one way—the best. A great deal of the earlier art of the Miniaturists can be discerned in the smaller works, the panel presenting a somewhat parchment-like surface. With the substitution of canvas for wood a new epoch commences. The term of apprenticeship to this craft of picture-making was hardly less than twelve years as a rule, so if at the end of that time the master and pupil seemed somewhat like parts of one whole, it is only what might be expected to result from such a close partnership. From generation to generation these traditions of craft descended, and remembering that all the art of the age was sacred, at least in its main characteristics, the fact that so many pictures are so much alike no longer seems hard to explain.

The craftsman's *Alma Mater*, the Guild, has been overwhelmed, it is true, but has only gone under, perhaps, and may turn up lower down. (By what signs shall we know it, and what name shall we give it then?) There are, at any rate, many who hope to see something like it again, and since the capitalists have revived the idea it seems to me that we shall. That the guild, like its modern successor the "Union," was a frightfully exclusive body, and that the independent worker lived in fear of his life, is not so well known as it should be. Although nothing from this point of view but an ordinary trade protection society, and particularly savage at that, it concerns us to know that it protected the craftsman so as to leave him free of his soul, and created conditions under which the best possible work could be done. If such was the "Guild," what, then, is the "Trust," the latest device of the capitalists, but an invention whereby the assumption of stability in a competitive system of trade is shown to be baseless.

"Combine" is the word on all sides; in this particular case Capitalists *versus* Consumers. It remains to be seen whether a capitalistic, *i.e.*, guild system will be as popular, and whether, like that, it will be abolished by statute. It may be remarked in conclusion, without intentional reference to the financial affairs of South Africa, that the Chartered Guilds were the richest, and, as a matter of course, the most tempting.

ERNEST RADFORD.

On Reflection.

The Building Trades and the War.

Amidst all the disagreements and discussions to which the South African war has given rise, there is happily one point upon which Englishmen of all parties are in complete accord, namely, the duty that rests upon us all of ministering to the needs of our wounded soldiers and of the families of those who have fallen in battle. There has hitherto, however, been a little danger lest the money generously and willingly provided may be expended in relief which affords a merely temporary benefit. The pitiful case of the permanently disabled soldier discharged from the army with a pension inadequate to supply even the barest necessaries of life has been overlooked. Yet there will be many such cases before the war is ended. We are glad to announce that to the Building Trades of England is to belong the honour of repairing this serious omission. A strong committee, with Mr. Edwin O. Sachs, the well-known architect, as chairman, has been formed to secure the erection of Homes of Rest for discharged soldiers on a freehold site at Bisley generously given by Lord Pirbright. An interesting feature of the scheme is that contributions in kind are specially asked for; those of our readers, therefore, who are in a position to offer gifts of building materials, finished joinery, fittings and appliances likely to be suitable for the purpose will, we hope, lose no time in making their intentions known to the organisers of the scheme.

Details of the Scheme.

It is proposed that the gift shall take the form of the erection and equipment of six cottage homes, comprising in all one hundred beds, together with the necessary offices and a large recreation room and workshop. These six homes will be known as the Building Trades Gift to the Nation. Much of the work in connection with the buildings will be carried out gratuitously, so that donors may be assured that their gifts will be devoted with the smallest possible deductions to the object for which they are intended. The management and maintenance of the homes will be in the hands of a special sub-committee of the Sailors' and Soldiers' Help Society — an excellent institution of which H.M. the Queen is patron. The administrative work, together with the construction of the homes, will be in the hands of a small executive, comprising the originator of the gift, Mr. Edwin O. Sachs, acting as chairman, Mr. Fred. R. Farrow, F.R.I.B.A., Mr. F. Hammond, F.R.I.B.A., and Mr. Ellis Marsland (District Surveyor), with Sir John Taylor, K.C.B. (H.M. Office of Works), Mr. Thos. Blashill, F.R.I.B.A. (late Architect of the L.C.C.), and Mr. Arthur Cates, vice-president R.I.B.A. (late Crown Surveyor), as advisers. An influential body of stewards representing the donors includes such well-known names as Mr. J. Randall, President, Institute of Builders, Mr. J. Howard Colls, Mr. George Jennings, and Mr. Sam. Waring. The correspondence in connection with the gift will be dealt with by the executive at the offices of the British Fire Prevention Committee, who have lent their reading-room for this purpose, and all offers of contributions, &c., should be addressed to "The Executive of the Building Trades' Gift, 1, Waterloo Place, Pall Mall." As we announce on the previous page, we have started a shilling fund in connection with this scheme, and are prepared to receive and to acknowedge in these columns money contributions from one shilling upwards. One interesting feature which will specially appeal to the building trades is the fact that when a selection has to be made for a place in the homes, preference will be given to men who have been engaged in the building trades prior to service with the colours, or who have been connected with these trades while in the reserve forces. We feel sure that no words are needed to commend the object of the scheme to all our readers, but it often happens that schemes admirable in their objects are marred in the carrying out. In the present instance we have no such fears; the names of those who are lending their assistance to the scheme, and the common sense, business-like principles on which its details have been devised are sufficient assurance that if the members of the building trades respond, as we feel sure they will, with alacrity and generosity, we shall soon have a valuable permanent addition to the benevolent institutions of this country, and a noble memorial of the greatest of British industries.

"The National Trust."

We have frequently had occasion to refer to the good work that is being done by "The National Trust for Places of Historic Interest or Natural Beauty." There have been times in our history when many buildings of architectural beauty or historic interest have been destroyed or spoiled by the accidents of war or the deliberate assaults of ruthless iconoclasts. But it may be doubted whether any period—even the most stormy—has witnessed so great a destruction as has been going on in these last fifty years of peace and progress. And if within the last two or three years there has grown up a new regard for historic buildings and scenes of natural beauty, and a juster sense of their value to the nation, it is largely due to the educative work that has been carried on by the National Trust. For a clear account of the origin of the Trust, the objects for which it exists, and the means by which it seeks to carry out those objects, we refer our readers to an admirably written article by Mr. Hugh Blakiston in the January number of the "Home Counties Magazine." Our forgetfulness or indifference in the past has sadly marred many of our cities and villages, and—as Mr. Blakiston suggests in a striking passage—it has left its mark upon the citizens themselves. "We see the lava stream of bricks and mortar obliterating the pleasant woods and fields; we see the smoke-laden fog replace the white morning mist, and dull the quick colours of life to the dismal hues of death. The gin-palace swallows up the ancient hostelry, plate-glass windows and facia signs take the room of latticed casements and over-hanging eaves; monstrosities in terra-cotta flaunt their meritricious charms in exchange for the dignity and repose of manor house and castle. And we ourselves grow daily into the likeness of the work of our hands, until a stroll through the suburbs of a great town becomes a night-mare of meaningless design and purposeless faces, complementary the one to the other." To restore the waste places and bring back the vanished sweetness and beauty may be impossible, but to preserve the beauty that yet remains is the worthy task in which the National Trust is engaged, and it is one which must command the sympathy of all but the most hopelessly mercenary spirits.

The Study of the Human Form and its Influence on Architecture.—II.

BY A. R. JEMMETT.

(Continued from page 334, No. CCLVI.)

ALTHOUGH great importance has been attached to drawing as a method of study, it is not the intention to assume that nothing can be learnt from the human form by other means. To be conscious of the presence of a beautiful object affects the taste. To let the beauty of nature sink into our hearts purifies the emotions and idealises the mind. Inspiration may be derived from a sunset, although the precise forms and values of the colours are not noticed; so, too, from the human form. But this unconscious, unthinking enjoyment is not sufficient for the artist. If he wishes to produce creations that will awaken like emotions, he must do more—he must observe accurately. By recording on paper the results of his observations, he is able to compare them with the original, and to correct them till he gets them accurate.

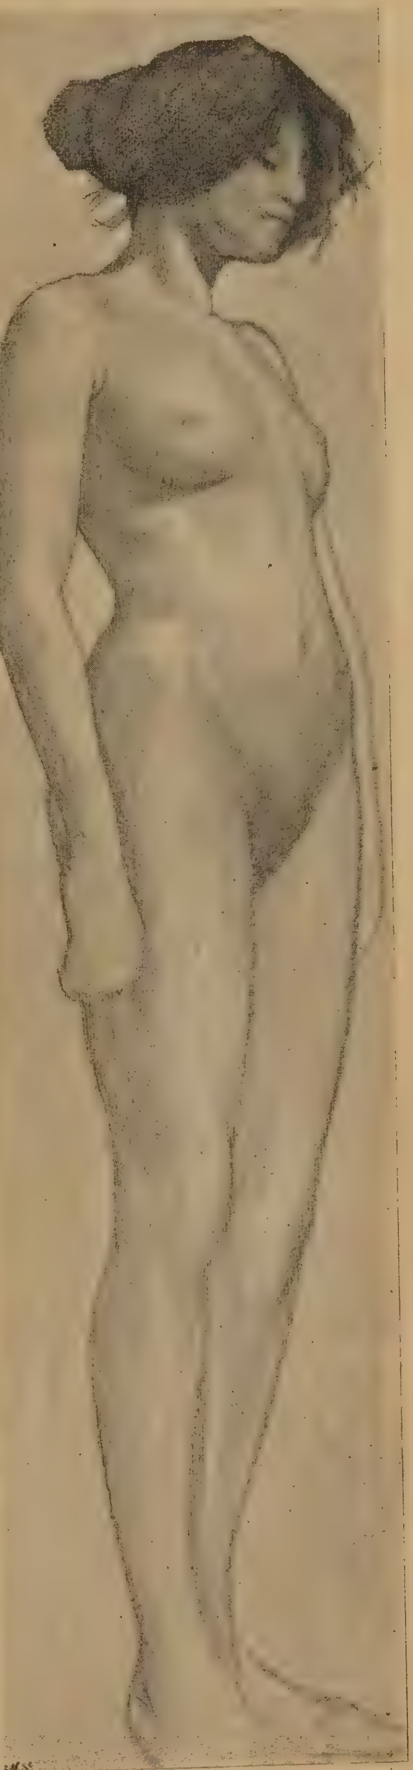
A THREE HOURS IMPRESSION OF THE GENERAL EFFECT. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

We often hear figure drawing spoken of as a special sort of drawing, a separate art in itself, which the architect cannot be expected to practise. It seems to be assumed that he draws well enough in his own way, but he does not happen to draw the figure; like a man who plays the piano, but does not happen to play the violin. This is hardly the right way to look at it. There is only one process of drawing, whatever subject it may be applied to—simply the process of putting things in their right places, whatever they may be. The differences in drawing different objects are really differences of method in recording our observations, differences of technique, of manual dexterity, which may vary according to the materials employed and the object to be drawn; but the real mental process is the same for all.

Again, it is often said that the man who can draw the figure can draw anything, *i.e.*, everything. If we state this proposition inversely we express the wider truth, that the man who can draw anything can draw the figure. This does not seem to be so generally realised. If figure painters are, as a rule, better draughtsmen than other artists, it is because a higher standard is required for practical success; there is a higher standard of popular criticism. To draw a head to pass muster requires a greater power of draughtsmanship than to do the same for a tree. The width of a line makes all the difference in a face, but it is not so noticeable in a piece of drapery. Few people have any enthusiasm for drawing for its own sake—as an intellectual exercise. Most of us are content to draw as badly as public opinion will allow, as well as is necessary for practical success, and no better; so that unless a man has a practical necessity to draw figures, the chances are he will never take the trouble to learn to draw well enough. So that it might be said that the man who cannot draw the figure shows thereby that he cannot draw anything else of equal difficulty, and there are things of equal or possibly greater difficulty.

Take as an example certain architectural details of the finest Greek period. A group of horses from the frieze of the Parthenon, a Doric or an Ionic capital of the same period, these are probably as difficult to draw as any figure, if we would give them style. The man who traced the capital of the Parthenon was a consummate draughtsman, as great as he who drew the Madonna di San Sisto, or he who painted Philip IV. We are led therefore to this conclusion that, if we can draw architecture as it has been drawn, and as it should be drawn, we can draw well enough to draw the figure; conversely, if we cannot draw the figure, we cannot draw well enough to draw architecture as it has been and as it should be drawn. Until we can draw as well as the designers of such buildings as the Parthenon, we shall never be in a position to produce works of equal merit.

The movement that has grown up of late years for a more direct return to nature, questions the value of the study of the antique. This attitude has its dangers for the architect, if not for the realistic painter. The architect is not simply concerned with the types and individual characteristics of the men and women he sees around him, careless whether they be good or bad. It is not his ultimate business to represent them. He has in his mind, as well, the perfect form as nature intended it, and as it is sometimes possible to obtain it when the conditions of life are favourable. The conditions of modern town life are not favourable, but the life of ancient Greece was, in its Golden Age, and the sculptors of that time observed it with incomparable intelligence, and rendered it with incomparable art. Therefore the study of their works widens our view and helps us to realise what Nature intended by a man, not merely what civilization has made of him.



A THREE HOURS STUDY. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

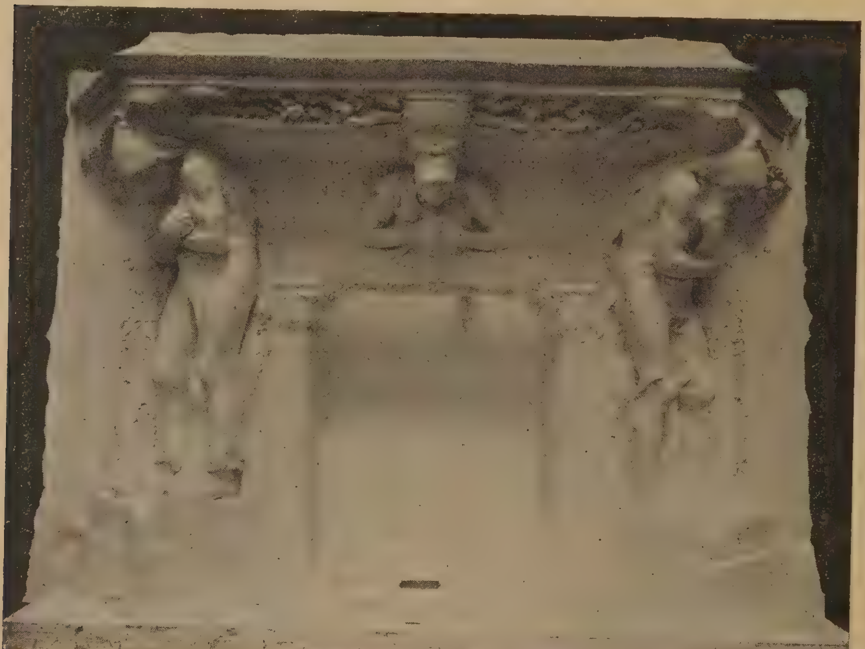
SILHOUETTE OF NOTRE DAME, PARIS. FROM A WASH DRAWING.

And, besides this, the Greeks evolved a type, a magnificent type. They, in a way, perfected nature; so that there is, for the architect, a special value in studying the ideals of so marvellously gifted a nation of artists.

For purposes of drawing, the antique presents many facilities to the beginner. A statue stands still, and for as long as may be desired, and so is of great assistance in overcoming the elementary difficulties of drawing and in acquiring a rudimentary knowledge of proportion and construction. The antique should, then, be studied first, so that we can go to the life with some knowledge and a greater power of draughtsmanship. For a living man is a different thing to a statue. He presents a different and far more difficult problem. Theoretically his form is always changing, either ripening or decaying. He varies from day to day, and hour to hour, influenced by health, fatigue, and temperature. He cannot remain absolutely still; he must breathe. Few are the poses in which his movement is unnoticeable, into which he can return again when once he has moved, or keep for more than an hour at a time. It is necessary, then, to be able to set up the complete figure correctly before it changes; to seize the leading lines that characterise the pose, that give the equilibrium, the action, and proportions. This power is more easily and quickly acquired from the antique, and, until it has been acquired, it is, perhaps, a waste of time, as far as drawing is concerned, to work from the life. For every single pose of the figure is a complete design in itself, of which no part can be altered without affecting the whole. If, then, it is not seen as a whole, and the essential points grasped and recorded at once, the drawing will never possess organic structure or coherence, and will never seem to live. It must be remembered, also, that no individual figure is perfect, and that it is very rare to find one equally and harmoniously developed. For this reason it is not good to draw too often from the same figure, or from the same type of figure; on the contrary, it is well to draw from as many different figures as possible, and to be always comparing and generalising. To be possessed by one type of face and figure, as some painters seem to be, suggests a limited outlook and imperfect sympathy.

For the same reason it is well to draw figures of both sexes and all ages, men, women, and children, to try and understand humanity as a whole. The male form in its perfection is, perhaps, the finest study, the grandest in construction. But, though "the noblest study of mankind is man," the most fascinating study is woman.

Every individual living figure has a distinct character and sentiment of its own—that is what we want to feel and express; for if we can feel the natural and individual sentiment of every figure, we shall more easily give the natural sentiment to every building. It is necessary, once and for all, to avoid false and affected sentiment. It is fatal. It is no use to try and draw the model with any particular sentiment that we may chance to admire. We do not want to try and draw like Raphael or Rossetti, or anyone else; we simply want to draw the model as it is, and to give it its true and characteristic sentiment. The architect has two things to do, first to study nature, and then to re-create on the same principles. When we are drawing from the life, we are studying nature, not designing; we have therefore express nature, not ourselves; when we design is the time to do that. There is so much more in every figure than any of us is ever likely fully to grasp and express, that if we consciously draw in any affected manner, other than that naturally suggested by the figure, we prevent ourselves from seeing so much we might otherwise have noticed. The more we express ourselves, the less we express nature.



BAFFIER-CHEMINÉE.

SILHOUETTE OF NOTRE DAME, PARIS. FROM A WASH DRAWING.

Conscious efforts to draw artistically defeat themselves. It is better to think more of the beauty of nature than the cleverness of our own drawings. If we really do feel the individual character, the natural poetry of the figure before us, and set ourselves with absolute sincerity and self forgetfulness to draw it as in itself it really is, the style will grow out of the subject in hand, and its natural sentiment will unconsciously appear in our drawings. All other sentiment in a life study is false, and therefore inartistic. The important thing for us is not what we think we feel or see in the figure, but what the figure really is; for we cannot reason from fancies, we can only reason from facts. If we do not see a figure as it really is, we do not see it right; we must train our eyes and brains till we do. For though colour may be a matter of feeling, form is a matter of fact.

It cannot be too often repeated that an architect studies Nature, not only to be unconsciously influenced, but also to understand it, to see into it as far as he can, to try and discover its principles. The drawings he makes for this purpose are simply records of his observations, and beyond that have no permanent value. They may, incidentally, betray artistic feeling and insight, but that is not the purpose for which they are made.

If, then, the architect's ultimate aim is not to paint like Velasquez, nor model like Donatello, neither is it to draw decoratively, with an exalted sentiment, like Raphael.

Within the scope of these articles it is not possible to more than indicate why, in one's own opinion, this subject is worthy of the architect's special attention, and in what spirit, what attitude of mind, he should approach it. It is impossible to discuss with any fullness many points in the human form of particular interest to the architect, and from which he can draw important inferences. The construction of the figure, its equilibrium, its silhouette—of peculiar interest in our misty climate—the various methods of study, such as modelling and painting, the application of descriptive geometry, and the scientific projection of shadows; true elevations of the figure, as distinct from the ordinary life study, which is a perspective view; the value of the Röntgen rays, as showing us the living skeleton; the question of drapery and its proper use and application, from an architect's point of view. Such subjects as these would require an article to themselves; here they can be no more than referred to in a general way.

Neither is it easy to say how far this study should be carried. It is a question for every man to settle for himself. So long as he feels that he is widening his sympathies and his ideas, so long may he pursue it with advantage. An architect can never know too much, provided he has the strength to carry his knowledge; neither can he ever draw too well; and as far as the subject is concerned, he need have no fear that he will ever exhaust its possibilities or interest.

But however far each man may elect to follow it, for the sake of its influence over his mind and taste, there is, for practical purposes, a great value in acquiring the power to set up broadly a possible figure from knowledge, in any required position. For, when figures are introduced into a building, they become as much a part of the general composition as any other detail, and their scale and arrangement require to be studied in relation to every other part, by the designer of the whole conception. As a consequence, all other details have to be studied in their due relation to the figures, which is not possible unless the figures can be put on the drawings precisely in the same way and with the same ease as any other feature. It does not seem conducive to harmony of effect to design part of a composition, leaving blanks here and there to be filled in by another man, who probably does not enter into the spirit of the thing; neither is it easy to leave spaces of the right shape and size unless we know how they are going to be filled; nor does it seem possible to foresee and realise the precise effect of the whole conception to make sure that the ultimate result will be harmonious; and where there is no harmony there is no art.

Owing to the fact that there is no one living school of thought in the plastic arts, but rather a thousand different cliques of sentiment, we do not find architects and sculptors educated together, holding the same ideas and breathing a common atmosphere. It is therefore most difficult to find a sculptor who can appreciate an architect's point of view, and who has been educated to understand the relative value of a figure in an architectural composition, or who is willing to sink his own personality to contribute to the general effect. This puts the architect in a difficult position. Either he must model the figures himself, which is not practicable—for if he can do this he must have neglected other things of greater importance—or he must be content with sculpture that does not exactly express his feeling and ideals, which, therefore, is out of character with the rest of the work—which does—or else he must do without it altogether, and this is, perhaps, the wisest course in the present unsatisfactory state of affairs, however much it may be regretted.

A TWO HOURS STUDY. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

In some other countries things are different. In France the architects study the figure as a matter of course. In the Beaux Arts the painters and sculptors have to know something of architecture, and the architects have to draw the figure and make designs into which the figure is introduced. This system has a tendency to foster a complete understanding between the architects, sculptors, and decorative painters. A notable example of this mutual sympathy is to be seen in the well-known group by Carpeaux in front of the Opera House. In this the sculptor has caught, in so happy a manner, the sentiment of the design, so entered into the spirit of the thing, that it is as if the same hand had drawn the architecture and modelled the figures.

But though the sculpture on this building varies greatly in quality, as is inevitable where so many different sculptors of different degrees of strength have been employed, the point to notice here is, that it is all of the same school, all more or less imbued with the same sentiment, and that the general result is harmonious. One shudders to think what would be the result of a similar undertaking in this country on so large a scale.

The study of this building, and of such works as the charming chimney-piece by M. Baffier, and the detail from St. Trophime, Arles, here illustrated, suggests how difficult it is to say where the architect's work ends and the sculptor's begins.

We shape the stone to whatever form we will, consistent with its nature; there comes a time when, from the intricacy or special character of the features desired, it becomes difficult to express ourselves by a drawing, easier to do so by a model; both methods are only means of expression; why should the architect be limited to either one? Again, there comes a time when features change from forms which are more easily developed geometrically, to those which are more easily developed by eye and hand; when plane surfaces and mouldings melt into foliage, and foliage into figure; when the figure becomes a part of the construction, and grows out of the foliage or purely conventional forms, in such a way as to render it impossible to say where one begins and the other ends. How is it possible to conceive such features without a knowledge of the figure, or to realise them unless the architect can draw or model? And why should it be considered advisable to draw such features as foliated capitals and other ornament, and out of the question to draw figures?

Although it is impossible, perhaps, for the architect in these exacting days to design and execute his own figure sculpture, yet it does seem necessary that he should at least possess sufficient knowledge to make him actually, as well as formally, the creator and director of the whole design; and sufficient facility of expression, to enable him so completely to convey his ideas to the sculptor, that the two men may work together as one.

(To be concluded.)

New Buildings in Leeds.—A large café is proposed to be built immediately above Wood Street, Briggate, from designs by Mr. Frank Matcham, London. The building is surmounted by a lantern tower, and the dining room is about 66ft. by 69ft. Two new Board schools are about to be built, one in Wintoun Street, the other in Lovell Road, plans of which have already been submitted to the Corporation. On the site of the old East Parade Chapel a block of buildings is to be erected for the North British and Mercantile Assurance Company.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"An architect must recollect that those who are to be moved by his buildings are not Greeks, Romans, Mediævals, nor Italians of bygone ages, but the people of his own time."—PROF. G. AITCHISON.

Our Inset Sheets. THE tower screen at Llantwit Major Parish Church, Glamorgan, is designed to separate the eastern (formerly the conventual church, now used for Divine worship) from the western church, which was formerly the parochial church, and is now in course of reparation. Llantwit Major with its surroundings is well-known throughout the archæological world, and the church is certainly one of the most interesting buildings in South Wales. The screen was designed by Mr. George E. Halliday, F.R.I.B.A., under whose care the work of reparation is being carried out. Mr. Halliday is also the architect of the church of St. George, Cwm Park, Rhondda Valley, South Wales, which was recently built by Mrs. Llewellyn, of Baglan Hall, at a cost of about £4,000, and will form the parish church of a new ecclesiastical district. The church contains a baptistry for total immersion, and seats 400 worshippers. The walls are built of blue pennant stone, with hard Doulting stone dressings, and the building is lighted by electricity. There is a handsome pink alabaster reredos, also the gift of Mrs. Llewellyn. "Ceannacroc," Glenmoristen, Inverness-shire, has been erected on Ceannacroc Forest for Mr. C. L. Orr Ewing, M.P. It is situated at the confluence of two rivers, at the head of a beautiful strath, and commands fine views. The house has been built of local stone, quarried on the spot, and finished with cream-coloured harling, with a few red sandstone dressings very sparingly used. The roofs are covered with red tiles and the half-timber work is painted dark green. Besides the erection of the lodge itself there has been a great deal of work in connection with stables and other offices, which have been carried out on a large scale. The house and all the offices are lighted by electricity. There is an ample water supply, and fire hydrants are provided without and within the lodge. The difficulties met with in carrying out the work were principally due to the distance of the lodge from the nearest steamboat pier—sixteen miles over a road not too good at the best. All the materials, except the rubble stone and sand, had to be carted this distance. The architect was Mr. J. K. Hunter, of 51, Sandgate, Ayr, and the contractors were as follows:—Mason and joiner work, Messrs. J. and G. Findlay, Glasgow; roofing tiles, Messrs. Woolliscroft and Son, Ltd., Hanley (sub-contractor, Mr. John Reid, Inverness); plumber work, Mr. W. Anderson, Glasgow; plaster work, Messrs. A. Calder and Sons, Glasgow; harling, Mr. C. Highet, Ayr; electric lighting, Messrs. Reid and Co., Ayr (sub-contractor, Mr. John Gordon, Glasgow); painter work, Messrs. J. B. Bennett and Sons, Ayr; grates and tiles, Mr. Thomas Main, Glasgow. Mr. James Watson acted as clerk of works for the greater part of the time. The architects for the new banking premises of the Yorkshire Banking Company, Ltd., in Thirsk, were Messrs. Francis W. Bedford and Sidney D. Kitson, of Greek Street Chambers, Leeds. The materials used are Farndale stone for the front, with red tiles for the roof. There are offices on the first floor and caretaker's rooms over. The fittings are of walnut. The contractors are: Messrs. Nicholson and Sons, of Leeds, masons and bricklayers; Mr. R. D. Ruecroft, Thirsk, joiner; Mr. J. Lindley, Leeds, plumber: Mr. T. Moore, plasterer; Messrs. Watson and Worsnop, Leeds, tilers; and Mr. A. E. Lister, Bradford, painter.

St. James's Theatre. ABOUT the end of this month, Mr. George Alexander hopes to open the "new" St. James's Theatre, for the interior has been entirely remodelled, and many features have been introduced to add to the comfort and convenience of the audience. By lowering the stage and the stall flooring some 3ft. it has been possible to provide both with a "rake" sufficient to give a good view of the stage from every part. There are now only two boxes, the Royal box and its companion on the other side of the proscenium. The gallery has been greatly increased by the addition of about a dozen rows of seats, providing additional accommodation for 400 persons, and a similar improvement has been made in the other parts of the theatre. For the convenience of the artists eighteen capital dressing rooms have been furnished, and the stage has now a depth of 60ft. The roof has been raised to a height of 74ft., the distance from stage to gridiron being 52ft., so that the scenery can be easily and expeditiously manipulated. Another feature of the front of the house is that separate cloakroom and bar accommodation is provided for every part of the theatre. The system of heating and ventilation is complete, fresh air being driven into the building and the vitiated air extracted by fans worked by electric motors. Along the entire frontage of the house a new glass awning has been erected for the protection of those waiting outside in wet weather The general scheme of the decorations, designed by Mr. Percy Macquoid, is based upon that of the transitional period between the reigns of Louis XII. and François I. of France. Red, green, and gold are the colours chiefly in evidence, and particularly prominent on the proscenium, upon the arch of which figure, in striking relief, the coats of arms respectively of Shakespeare and Arden on the right, and St. James and Dante on the left. A new act drop has been painted by Mr. William Telbin. The work of alteration and reconstruction has been carried out under the direction of Mr. Arthur Blomfield Jackson, successor to the well-known architect, the late Mr. C. J. Phipps.

Vandalism in Cyprus. THE following letter has been addressed to the Secretary of State for the Colonies on behalf of the Royal Institute of British Architects:—"Sir,—The President and Council of the Royal Institute of British Architects have had their attention drawn to two letters in 'The Times,' dated December 16th and 26th, 1899, and respectively headed 'Ruined Cities in Cyprus' and 'Vandalism in Cyprus.'" They are also informed that plans have been accepted by Her Majesty's Government for certain harbour works at Famagusta in connection with a tramway to Nicosia, in which the destruction of portions of the curtain wall of the fortified city is contemplated. The president and council respectfully beg that in the carrying out of any such works the fortifications and surroundings of this remarkable and almost unique example of an old walled city should remain intact. They venture to urge the great value of the place to the historian, the artist, and the antiquarian, as a picturesque monument associated with some of the most stirring events of the Middle Ages. In requesting Her Majesty's Government to reconsider their decision, the president and council would most respectfully suggest that the Custom sheds and railway works, to make room for which it is intended to destroy the portions of the curtain wall facing the old port, might be placed in the large tract of almost vacant land, nearly a mile in width, lying to the south of the town."

Polytechnic Successes. THE annual conversazione and distribution of prizes and certificates to students of the architectural and mechanical engineering classes took place at the Regent Street Polytechnic on Friday evening last. The past session has been a very successful one. In the building construction examination, South Kensington, out of 9136 students the first and second places with bronze medals in the Honours Stage, part 2, were gained by Polytechnic students. In the Honours, part 1, twenty-nine students obtained certificates in the Advanced Stage; one of the students was awarded the Queen's prize. In architectural design two excellents and two first class certificates, and in architecture six first class certificates were obtained by Polytechnic students. The architectural work is receiving additional attention each year. In carpentry and joinery the first Honours National Silver Medal, offered by the City and Guilds' Institute, and six out of the thirteen medals offered in the June and December examinations of the Carpenters' Company were awarded to students at the Polytechnic; as were also the first Honours National Silver Medal, the second Ordinary Bronze Medal, and the third prize, with Bronze Medal, in brickwork, and the third prizes and bronze medals in ordinary stages for the plumbing and plasterer's work classes. The School of Engineering has also been very successful. After the prizes had been distributed by his daughter, Colonel Robert W. Edis, J.P., F.S.A., congratulated the school on the success it had achieved. He emphasised the importance of planning in the construction of buildings, and mentioned that, though it was perfectly possible to fit the elevation to the plan, the reverse was very difficult and undesirable. An architect should always maintain his self-respect, and stand up for that which he felt was right, but he ought also to cultivate common sense and tact, and, while opposing faddists or those who had little knowledge of the subject they were speaking of, he should not forget that it was his duty to comply with his client's wishes, and not to build according to his own views. The great curse of the moment he felt was trade-unionism; he could remember the days when the architect and the builder, and the builder and his men, worked together harmoniously, and he knew the work was better done then than at the present time. Let those who were taking up architecture remember that they were writing a history; let it be well done. It may be mentioned that the annual subscription to the Polytechnic Architectural and Engineering Society (in connection with which meetings and visits are arranged) is half-a-crown.

An Old Well. A CORRESPONDENT writes to the "Standard" as follows:—"I saw it stated recently in one of the daily papers that in digging the foundations the Central London Railway in front of the for Bank of England, the workmen had discovered a disused well. This must surely be the same well that was curiously enough discovered exactly one hundred years ago. I have in my possession a small engraving by Rawle, taken from the 'European Magazine,' published by J. Sewell, Cornhill, June 1, 1800, of 'The Pump in Cornhill,' on the front of which is the following inscription:—"On this spot a well was first made and a House of Correction built theron by Henry Wallis, Mayor of London, in the year 1282.' Hughson, in his History of London, says:—'Near the entrance of the Exchange there is a cast iron pump of excellent spring water, erected by the patriotic contributions of the the Bank of England, the East India Company, the neighbouring fire offices, together with the bankers and traders of the Ward of Cornhill. The well over which it stands was accidentally discovered in 1799.' History repeats itself."

Explorations at Caerwent. SOME time ago we referred to the formation of the Caerwent Exploration Fund. The Executive Committee have just issued a statement of the work done during last summer. The excavations began on August 17th on a plot of three acres of meadow land in the south-west corner of the city. On the west side of this plot the city wall is continuous, but on the south side the wall is much decayed. This has, however, been traced by trenches. The rounded angle between the west and south walls was found to be comparatively well preserved, and the excavations here were extremely interesting. Trenches driven from the west wall revealed at least three buildings, one consisting of two rooms and, some 70ft. away, a large house consisting of a centre area or court surrounded by rooms on all four sides. Here two columns and a capital with good early mouldings of the Roman Doric order were found. The third house, having a hypocaust and a room with an apsidal end, was discovered to the north of the first-mentioned house. While these excavations were going on, Mr. Morgan, the village wheelwright and smith, and his two sons excavated the interior of the north gate, and revealed the two piers of the gate, the tops of which were only a few inches below the surface. The gateway itself had been blocked up later by regular courses of masonry resting on massive blocks of stone, one of which was a very fine capital. All the excavations have been fruitful in finds of the usual character, which are now arranged in a temporary museum in the village. Work will be resumed this spring, when the central area of the large house and the house on the north wall will be thoroughly explored. More funds are required, and donations should be sent to Mr. A. E. Hudd, 94, Pembroke-road, Clifton, Bristol.

RIGHTS OF LIGHT AND AIR.*

BY T. WALTER L. EMDEN.

(President of the Society of Architects.)

FOR some time I have endeavoured to bring about some amendment in the law dealing with questions of light and air, and the subject has been seriously taken in hand by the Society of which I am President. It is my desire, in the course of this paper, to show how great the necessity for alteration in the law is; and I trust also to show the remedy, and that it would not affect the rights of property.

It is the desire of my society to prevent or to do away with the opportunity of bringing freely (as can be done at the present moment) blackmail and improper actions, and also to prevent building owners running up buildings injurious to owners of adjoining property, without notice of any kind.

There has been considerable attention drawn at the present time to the want of High Court Judges to dispose of the actions brought during the current sittings, so that there shall not be arrears left over to the next. I am of opinion that not only could technical cases, such as cases of light and air, &c., be settled more speedily and equitably but with a small portion of the present expense by a Technical Court; and if the High Courts were relieved of this class of case (of which there are considerable numbers every sitting), the necessity for strengthening the Bench would probably be done away with.

One of the first difficulties is the question of the rights of property. A right to light and air or any other easement under English law is acquired by having had an uninterrupted use for a certain number of years, and becomes a right of the property. Now, in Scotland, and on the Continent where Roman law prevails, these questions cannot be made the means of blackmailing as they are in England. Now, I do not intend to propose any interference with the acquisition of rights such as are obtained under English law. No right would be lost by the remedy I have suggested. In many, and in fact a very large number of cases, it would be much better to describe many of these acquired rights as a theft of that which rightfully did not belong to the property which acquires it.

The present state of the law assumes that everybody knows it, and understands that if a gutter is overhung on to the adjoining premises, if a floor is supported on a wall belonging to an adjoining owner (even though he may never have seen or known that the floor was so supported) for a certain number of years, a right will have been acquired which will have to be reckoned with, often enough to the tune of very serious amounts when an owner wishes to deal with or rebuild his property. I have known cases where, through a party wall, and in more than one case through a wall belonging entirely to an adjoining owner, windows have been cut through above the roof, not only entirely unknown to the freeholder, who had let the property for a long period of years, but without the consent as also without the knowledge of the occupier or leaseholder. A law which allows all this to be done necessarily cannot be very perfect, and it hardly seems to me like a protection of the rights of property; but it is the law, hence its power for evil must be curtailed as far as the law has to be reckoned with.

To follow one of my illustrations a little further—A person who I will call "A" owned a house at the corner of the esplanade and a side street in a large seaside town. Some period after, a person whom I will call "B" erected a house in a side street adjoining "A's" property. It was desired many years after by the owner of the corner property to re-erect his premises, carrying them a floor or more higher than they originally were. Provision was made for the light and air of the adjoining owners of the esplanade, but as there was an independent wall belonging to "A" between "A" and "B's" premises, and the lights in the side street look out only to the back and front, no provision was deemed necessary. On pulling down the property it was discovered that a window had been cut through and put in by "B" between the two hips of "A," the building owner's roof; that is, through the independent wall of "A." When "A" proceeded to pull the independent wall down, it was found further, that although "B" had erected a wall from basement to ceiling of the ground floor, that above that height the wall was omitted, and support taken off the existing independent wall of "A." There was no record of any right having been given for either window or support, and so far as an examination of those who owned the property formerly was concerned, no information could be obtained of any notice having been given. The solicitors, in whose hands the property had been for a great number of years, had no information either that any right or permission had ever been asked or given, or notice received. Yet I take it that the side street owner, "B," was within his right to claim and to prevent the corner owner, "A," raising his building, and he did so, and also claimed and obtained the right to use the independent wall more or less as a party wall.

Now I would ask any common-sense man upon which side, taking these facts as correct, should the right of property lie? Upon which side had the rights of property been protected?

This is not a single case; there are scores of similar cases. I think while this case goes to illustrate my point, their numbers will prove the waste there must be by expensive actions, while the delays there must be when owners attempt to build are almost unlimited. There is hardly a building commenced in which some difficulty as to light and air does not crop up.

I do not in the remedy suggest alteration in the manner in which such rights are built up under the law. I hope that the remedy by preventing wasteful expenditure in lawsuits, if once brought about, would go a long way to prevent not only many of these infringements being sought after, but their being made a source of blackmail where they exist, and also preventing serious delays to the building owner (which delay is after all, the main reason why large sums were paid); to be stayed by an action for injunction is in many cases not only serious but often ruinous. I do not by my argument or this illustration, put it forward that there are no legitimate claims of light and air, because there are many; and equally on this side, the interference with rights of owners would be prevented and no one would be prevented from protecting their rights by the fear that the building owner (who possibly a wealthy man), will put them to all the expense he can, and at least to the expense of a heavy action.

The fact that notice must be given before building is commenced and that the case would be brought at once before the Technical Court, would in my opinion, and I think in the opinion of most people go a long way to prevent illegitimate claims on both sides of the question.

I will give you an instance with which I have become acquainted, and which will still further show the trivial nature of some claims set up, and also the delay and expense which they can cause.

In this case considerable improvement had been made to the surrounding property by the building owners, and a claim was made by the owner of a small property, which a year or two before the improvements would have sold for about £1,000 freehold. The claim of the plaintiff was no doubt right to the extent that his building would be affected as to light, and had he in the first instance put forward his claim he would have enabled the building owners to arrange the buildings in conformity with any line which had been settled. But the course taken was to allow the building owners to commit themselves thoroughly to the building operation and to wait until the full height at which any claim for light must be made was attained. Then the claim was made, and all the work done above the height, even before the injunction was obtained was eventually decided by the judge to be pulled down. I suppose the costs and expences were not less than £2,500 and the time occupied by the action eighteen months; but in this case the buildings were pulled down rather than buy the claimant's premises at an exorbitant price, which I am of opinion was the real object in view. That the building owners were allowed to proceed in front of the windows of the plaintiff with their work until the last moment and to do so in such a manner as showed conclusively the intention was to erect a high building, without a complaint which if made would have stayed the building owners, seems to leave but one obvious conclusion to be drawn. When building owners are thoroughly committed to a building such as this was, it is of course highly probable they will pay and pay high rather than be stayed in their work; but in this case if such was the object it failed, but as I have stated with a waste of £2,500 and eighteen months of time. This case is not singular, there are undoubtedly hundreds of them, and the waste and delay and uncertainty would total up to an enormous sum of money every year.

There being no means such as I have suggested there should be means under a Technical Court, by which notice can be given to all adjoining owners, as it is usual for these claims to be made only when building operations are observed to be proceeding, at all events where it has not been brought to the knowledge of the adjoining owners by a party wall notice or some other means required under the Acts dealing with building operations.

When notice is received from the claimant it is possible it is followed up by some little time being spent in negotiations, then if these fail, by an application for an injunction, all this probably occurring after the building owner is committed to his contract. Necessarily, in claims such as these, complicated by many drawings and technical questions, the judges cannot give a decision on the application for an interim injunction, and the case goes for trial, sometimes with and sometimes without the grant of the interim injunction; and from the date at which notice was first given for an injunction the trial will probably not be less than twelve months, and may not infrequently extend to eighteen months or two years.

Building owners and professional men will understand what such a delay means in the midst of a building operation, the difficulty with the contract and contractor, and the loss of rentals and of business, and will be able to estimate pretty accurately what pressure such delay bring to bear on the building owner to come to a settlement even upon terms which may be absolutely outrageous. Another and strong incentive to acquiescence in heavy claims, to avoid actions at law, is, that in order to try these cases it is necessary to bring a considerable amount of evidence before the judge and jury, all of which is expensive, and all of which must be met on the other side by experts and witnesses equally expensive, and both may fall on one of the litigants. I have known cases in which for the proof of one angle of light (which was only considered a minor portion of the case) something like eight or ten drawings had to be prepared with all the necessary copies, and what is even still more expensive, models of the building in question prepared also. In cases, the decisions of which are so uncertain as these decisions are, it is absolutely necessary to put in evidence of the most minute character, so that it shall be most thoroughly brought home to the jury as well the judge (the jury too, composed of men who have no technical knowledge) the exact value of each claim made. Now, on the other hand, this evidence, of course, would be entirely unnecessary in the event of the case coming before the Technical Court, where the true nature of the claims would be easily and speedily ascertained and dealt with.

---

* Summary of a paper read at a meeting of the Sheffield Society of Architects on January 9th, 1900.

I think what I have said goes a long way to prove what the expense, difficulty, delays and uncertainties are in dealing with cases of light and air, and I think also sufficiently prove the necessity there is for some radical alteration in the law, while the advantage to be gained by determining these cases expeditiously and economically, are, I think, evident to all.

It is not a question of taking away any rights of property, but of protecting those who have rights from having them taken away, and those who desire to build from paying blackmail. The suggestion which is made for a remedy, is the constitution of a Technical Court, under the London County Council, in London, and under the Corporation in provincial towns and cities.

[Mr. Emden then gave the same details of the scheme as he gave before a meeting of the Society of Architects, reported in our issue for August 9th, 1899.]

THE DISCUSSION.

Mr. Holmes, in proposing a vote of thanks to Mr. Emden, said that they all agreed with the serious condition of affairs that arose in consequence of the delay that the law entailed. Sometimes, in endeavouring to protect the lights of surrounding property by writing to adjoining owners, they invited frivolous actions. He was in favour of such questions being brought before a local tribunal; but he was rather jealous about giving more power to municipal Corporations. He thought the difficulty might be got over by the establishment of a court consisting of legal and professional men.

Mr. E. M. Gibbs, in seconding the motion, was also of opinion that it would be a mistake to put the matter in the hands of the Corporation, who had probably quite as much as they could undertake.

Mr. Arthur Wightman said he would adopt a more drastic method of dealing with the question. Never, in the whole of his experience, had he known a case where a right to light and air had not been stolen or secured without the knowledge of the owner. He had never seen a grant of light and air by deed. His idea was that the law should be altered so that every man should have the right to build as high as he chose on his own land, subject, of course, to the usual municipal regulations.

Mr. Joseph Binney remarked that he would not have much confidence in the tribunal suggested by Mr. Emden. They would not get the collective wisdom of the Corporation, but the matter would be delegated to a committee or sub-committee.

The Chairman, Mr. J. Smith, did not see why they should not have a technical court, constituted of representative architects, surveyors and solicitors, having the right to call upon the Corporation for the use of the plans deposited for municipal purposes.

The vote of thanks was then carried, and

Mr. Emden, in reply, said his suggestion was that the Corporation should appoint the officers to deal with questions as they arose. They might have a solicitor or barrister, a surveyor and an architect to form a tribunal, the three being local men. They would work independently of the Corporation. He referred to the work of the Dean of Guild in settling building disputes in Scotland. He said those courts had worked well there, and he hoped to see such courts as he had referred to established in this country.

Correspondence.

PRICE OF BRICKS.

To the Editor of THE BUILDERS' JOURNAL.

BALHAM, S.W.

SIR,—Your expert "R. W. C.," on p. 340 of your issue for January 3rd, gives the price of stock bricks in London at per M of 1,200. I should like to know who has ever bought or sold bricks in that way. Also, what does prices "in London" mean. Is it (1) at merchants, wharves, (2) on the job, or (3) alongside in barges in London? Had his annual averages been those of the last mentioned, his list would have been intelligible and useful, and the more constant charges for wharfage, cartage, &c., could be easily added; as it is, the information given is not very valuable, and if your expert proposes to explain that he has averaged the above-mentioned three, the list will be of even less service.—Yours faithfully,

J. D.

CLEANING & PAINTING WINDOWS.

To the Editor of THE BUILDERS' JOURNAL.

BEDFORD PARK, W.

SIR,—I have read with much interest and pleasure the proposals of the London County Council in respect to the recommendations of the Local Government and Taxation Committee to make a series of regulations for the better protection of persons (especially female domestics) employed in cleaning and painting windows.

This is a subject which has attracted my attention for many years past, and being very much interested in the proposals above mentioned, venture to draw your attention to a detail in connection with the recommendations which, in my opinion, should be amended if the working of the regulation is to prove effective. The detail in question refers to the height from the level of the ground at which it shall be an offence to permit a person to stand on the window sill for the purpose of cleaning or painting the window. An examination of the newspaper reports of window cleaning accidents shows beyond all question that about three-fourths are due to persons overbalancing themselves whilst in a sitting posture, and with great respect, therefore, I suggest that the regulation should be amended as necessary in order to prohibit any person standing or sitting on the sill of any window for the purpose of cleaning or painting such window or otherwise for such purpose exposing themselves to unnecessary risk. I would further suggest, in order to avoid any misunderstanding of the meaning of the words in the proposed regulation "without sufficient support," that no support should be deemed by the authorities "satisfactory" unless the use of the means of such support be formally authorised by the London County Council by the issue of a special certificate to makers of special appliances.

I see it has been stated in the Press that regulations of a somewhat similar kind to those proposed by the London County Council have been in force for some time both at Glasgow and Edinburgh. Permit me, though, to state that although it is true that such regulations have been made in these cities they have never been enforced, and I fear that unless special measures are taken by the London County Council to rigidly enforce any regulations of the kind for London that, as in Glasgow and Edinburgh, the regulation will prove a "dead-letter."—Yours faithfully,

A. E. GODDARD.

SEWAGE PURIFICATION.

To the Editor of THE BUILDERS' JOURNAL.

DUBLIN.

SIR,—My attention has been drawn to a letter in your issue for January 10th from Messrs. Henry Ough and Sons, criticising statements made in a paper which I wrote for the Congress of the Sanitary Institute at Southampton last September, entitled "Sewage Purification without Filtration," which was published in your issue for December 27th.

The subject is such a wide one that it would be impossible to deal adequately with the observations of Messrs. Ough and Sons within the limits of a letter. If they would refer to an address which I delivered at the opening meeting of the Dublin University Engineering Students' Society, which was published in "The Surveyor" for December 15th last, I think they will see the way in which some of my figures have been made up.

Evidently the experience of your correspondents has been principally confined to country houses and villages, whereas my observations were primarily addressed to the purification of the sewage of large centres of population.

As regards country houses and villages, it is true that the cost of suitable installations involving precipitation and sludge removal is often heavy, but in this connection it must not be forgotten that, when the sewage is of a purely domestic character, biological treatment by filtration does not present the same difficulties as it does with town sewage.

I have had a great deal of experience in dealing with the sewage of country houses and institutions, and in these cases I think perhaps a simple system of surface or subsoil irrigation after preliminary straining is one of the best methods of disposal where the circumstances are favourable. In other cases, I have no doubt that biological filters would give good results, but my views on the subject of sludge have been fully expressed elsewhere.

I have had also a considerable amount of experience in dealing with the sewage of towns, more especially in the north of England, and it is in this connection that my calculations have been made. In all these cases the sewage is of a very mixed character, containing trade liquids of all descriptions. This class of sewage is far less amenable to biological treatment by filtration owing to the large percentage of inorganic suspended matter.

Messrs. Ough and Sons appear to think that a sum of 10s. 6d. per million gallons is a ridiculous figure to give for the cost of a chemical to take the place of a bacterial filter, but it must not be overlooked that this figure is given in comparison with the cost of filtering sewage which has been previously clarified by precipitation, as compared with the cost of purification of the same liquid by the addition of an oxygen carrying compound, such as nitrate of soda.

At Halifax, when we were dealing with 100,000 gallons a day for a period of four or five months as a demonstration, the actual quantity of nitrate of soda which we added to the liquid was half a grain to the gallon, and, at the rate at which we were purchasing the nitrate of soda, the actual cost was only at the rate of 6s. per million gallons treated.

At Northallerton, in Yorkshire, where we are dealing with the whole of the sewage of the town, amounting to over 150,000 gallons a day, the quantity of nitrate of soda required is greater, because the sewage is more domestic, and contains more organic matter. But even at Northallerton the necessary quantity does not usually exceed one grain to the gallon treated, which is equal to 12s. per million gallons. Taking an average of these two figures, you get about 9s. or 10s. as the cost of the nitrate of soda.

As regards the cost at Sutton, the figures given for the cost of precipitation and land irrigation, namely, £15 11s. 11d. per million gallons, is obviously inflated in some way, and cannot, I believe, represent the real cost. If the purification did cost any such sum, there must have been some great extravagance. Every civil engineer who has had experience of sewage purification ought to know that such figures as these are not fair ones to use for comparative purposes.

In making my calculations I have based my figures upon the estimates and reports of such distinguished engineers as Mr. James Mansergh, M.I.C.E., Mr. Santo Crimp, M.I.C.E., Mr. Baldwin Latham, M.I.C.E., Mr. Thomas de Courcey Meade, M.I.C.E., and Mr. Edward Escott, M.I.C.E.

At the request of the Editor of "SPECIFICATION," I have in preparation an article which will, I expect, appear in the next volume of that valuable publication, and in which I hope to give some further information on this subject.—Yours faithfully,

ARCHITECTURAL ASSOCIATION.

THE DOME AS THE BASIS OF AN ARCHITECTURAL SYSTEM.

By ARTHUR BOLTON, A.R.I.B.A.

A MEETING of the Architectural Association was held last Friday at No. 9, Great Conduit Street, Regent Street, W., the president, Mr. G. H. Fellowes Prynne, F.R.I.B.A., in the chair. The minutes of the previous meeting having been read and confirmed, Messrs. L. W. Ensor, N. A. Leech and F. E. Lloyd-Downes were elected members of the Association. Mr. Bolton then read his paper on "The Dome as the basis of an Architectural System." The paper, which was illustrated with a large number of measured drawings and photographs, was as follows:

The object of this paper is to show that the Dome is not only the grandest of architectural features, but may be regarded also, equally with the vault, as the basis of an architectural system.

A tendency exists to regard the Dome more as an isolated feature, centralising in character, than as the expression of a principle of covering, capable, like the vault proved to be in the hands of the Gothic architects, of pervading the whole structure of the building to which it is applied—such a proposition might, I think, be deduced from a survey of the application of the dome in the buildings of more than one epoch, and from examples developed on very varying lines of plan. The requisite clearness of idea, however, can best be maintained by restricting our survey to one epoch, the Renaissance in Italy, and by further selecting two types, which I think may be traced in the churches of that period.

The considerations brought out, however, by the study of the examples taken are by no means intended to be confined solely to buildings of that epoch and character. If the idea of a definite principle in the use of the dome be granted, the further value of these examples will consist, not in the particular details characteristic of that period, but in the light thrown on the general problem of the structure, in an artistic sense, of such domical interiors.

Similarly, the restriction of the examples to churches only is an accident rather than an essential, a great development of such buildings having taken place in Italy simultaneously with a revival of interest in the dome as an architectural feature.

The modern dome is an Italian creation, and the numberless examples to be found in that country present the series of changes and experiments that mark the introduction of a fresh element in architecture.

With the spread of the Renaissance such studies were carried abroad, and two examples I have taken from Spain as witness of the wide interest to the problem of the application of the dome at that epoch. There is an unfortunate paucity of examples in this country, but the work of Sir Christopher Wren shows the influence of the movement, and though his work exhibits a preference for vaultings and flat ceilings, still singularly interesting results were achieved by him in the application of the dome at St. Paul's, St. Stephen's (Walbrook), St. Mary-at-Hill, St. Mildred, and at two other destroyed churches of a later type.

The duration and wide extent of the Renaissance movement, its composite character and divergent tendencies, render selection imperatively necessary, and difficult as is the task of suggesting lines of development, still the attempt is worth making, because of the interest and value that may thus be found in what would otherwise seem to be merely isolated experiments.

There is, moreover, no reason to suppose that the movement has exhausted itself, or that as the basis of modern European architecture, in a wide sense, it will yet be displaced for a long period. What has happened is that the special interest that was attached to the Order system, derived or associated with Roman architecture, has lapsed, and that consequently lessons may be drawn from a study of the buildings of the Renaissance independently of the customary architectural features and details of that period. In the fuller knowledge and interest of the present day in works of earlier epochs, it would be a mistake to regard Renaissance methods of treatment in matters of detail as the only ones suitable and expressive for modern, and particularly church, architecture on a domical basis. Nor, on the other hand, is it wise to refuse any merit or worth to any examples, either of an early or late date, owing to a comprehensive prejudice regarding their details.

What "building in a good Roman manner" meant to the Renaissance men is becoming mythical to us who have lost touch with a sentiment due, on the one hand, to a restricted knowledge of old classical architecture, and on the other, to the historical and literary associations connected with ancient Rome; while as regards the quarrel between the orthodox and the rebel Rococo School we are no longer concerned to take sides, but rather to appreciate whatever signs of progress we can detect even beneath a mask of detail that may seem oftentimes sufficiently inappropriate.

Working, therefore, on such lines as those traced out above, we can proceed to select for study two types, to be roughly distinguished as—*I. The Domical Church*, and *II. The Five-Dome plan.*

The first of these types is the result of the application of the dome as the system of covering to a settled form of church plan that had been handed down from the Middle Ages. That the common type of church plan, which is the result, mainly, of the Gothic system of vaulting, modifying previous structures popularly described as basilicas, should be equally affected by a new phase, such as the introduction of the dome, is only logical. It is a fact that may be briefly illustrated by one point only—a matter of primary setting out—such, for instance, as that the basis of the Gothic plan having been a nave of oblong bays and an aisle of squares, with the dome a square compartment, became desirable throughout. Though the nave of St. Paul's shows us that some degree of compromise on this point is possible, still this condition is one of radical importance.

If the test of style in a Gothic cathedral be, as has been suggested, that every part should be vaulted, so also in a domical building, the dome should be the chief covering agent. The first type, therefore, "The Domical Church," is one of peculiar interest as the study of the effect of the introduction of a new principle of covering to a settled type of plan, largely the outcome of a preceding system.

The second type, "the Five-Dome plan," exhibits the dome in its most characteristic development from the original simple sphere, covering a single apartment. In this form the chief dome is presented in a relation of contrast and proportion to its four satellites, while the originating idea of the cupola as expressive of space is preserved, according as the scale of the surroundings has been successfully calculated to enhance the main effect.

We shall find that the two types we have chosen to treat are often overlapping, for, obviously, a plan like that of St. Salvatore, Venice, is formed by repeating the five-dome plan, in order to obtain the length of a church of the common type, while S. Alessandro may be described as a compromise, being a five-dome plan with an eastward in place of the more usual westward extension. For the purpose of our classification, however, there is a sufficient distinction between the two types, as the five-dome plan is a geometrical form complete in itself, while the domical church is the outcome of the use of the dome as the covering principal for plans of the traditional type.

The subject of the leading domed churches of Europe has been so often and so well treated that familiarity can be assumed with the plans and treatment of the Pantheon, St. Sophia, St. Mark's, St. Peter's, St. Paul's, &c.; all the more, because in reality they are examples of another type, being mainly built as domes, in the sense in which the Pantheon at Rome is a dome; namely, a circular apartment whose effect is due to its spherical ceiling. While my object is to show the changes that result from the application of the dome, when used to produce a domed interior of a complex character, one in which the annexes contribute to, but are not sacrificed by, the special effect of a great dome.

In order, therefore, to deal with the subject in sufficient detail, I have set aside in addition to these great dome churches, the octagonal type also, which starting from Roman forms and the early baptisteries, passes through such phases as St. Vitale at Ravenna and Santa Maria Angeli at Florence, &c., to the developed form of Santa Maria Salute at Venice, examples resulting in the main from the addition of aisles outside the primary octagon.

Another type passed over is that of the simple Greek Cross, as Santa Maria Carceri at Prato (by Guiliano Sangallo, built in 1485-91), of which form numerous examples exist in Italy, as until the plan is enlarged to a square, by the angles being filled in and treated with minor domes, a line of development can hardly be said to have been started. In reality, the two forms, the Greek Cross and Five-Dome plans, are distinct types, with probably a separate, if related, origin.

The problems of vaulting left unsolved by the Romans found an outlet in that phase which we call the Gothic style, the essence of which as a vaulting system lay—firstly, in the device for roofing oblong bays by means of pointed arches, thus superseding the clumsy Roman methods of groins of elliptic and double curvature; and, secondly, in a special and continuous development of the rib as the feature of the vaulted covering. By Gothic analogy, therefore, that which seems to be necessary for the progress of a style is a certain emphasis of leading points, which will then pass imperceptibly through various phases, often returning in the end to the point of departure. Thus we see the rib running through a series of changes until, in the fan vault, it has sunk to a surface decoration, one of the points, in fact, from which it may be said to have started. Similarly, in a Domical System, we might expect that the problem of expanding the simple domed apartment of the Pantheon, on the lines of the complex type of church plan worked out during the Middle Ages, would lead to changes, both in the main characteristics of the dome itself, and also in the plan to which it was applied. Nave and aisles are crushed by the space of the dome pure and simple, and the problem took two shapes, one in which a great dome was the essential, and the surrounding parts were merely related to it, and served to enhance its value, and the other in which the dome is modified to the existing plan, and then becomes, as it were, only a new system of covering, possessing, as compared with the preceding, the effect of surfaces instead of lines, and of space instead of height and length. In such a process the loss might be great, the simple effect of a great sphere tending to disappear in the multiplication of parts; but the gain should be in the unity resulting from the universal use of the dome in all parts of the plan, and in a step taken towards the development of a complete system, as possible basis for a new style.

That the results of the first efforts were not a complete success does not mean that the problem was an impossible one, but only that the originators could not clear themselves at a bound from those Gothic traditions that explain the structural compromises of St. Peter's and St. Paul's. Half the interest of an enquiry into domical principles, and indeed into the architecture of the Renaissance as a whole, lies in the unsolved problems presented. Look at the internal treatment of St. Paul's. What a series of difficulties it admittedly reveals; but how little confidence do we feel that our age could have better solved the problem of its architecture.

Before proceeding to concentrate, therefore, our attention on the two types thus marked out—namely, "the Domical Church" and "the Five-Dome" plan—we must proceed to consider in a general way the special qualities of the dome.

The essence of the dome internally considered in spaciousness, and the majesty and harmony of covering a plan with its own section is most fully realised in the Pantheon at Rome. This effect, however, is accompanied by a lowness of proportion which, after the great height of the mediæval work, could hardly appear other than trivial. Moreover, the bondage of the circle is felt, and an enlargement of the diameter produces little extra grandeur compared with the actual increase of size. The first efforts, therefore, in the use of the dome are marked by a great height, which, though lower than the previous Gothic proportion, was soon felt to be intolerable, and the progress of domical building, as it may be traced in Renaissance examples, is a record, with some exceptions, of a continued reduction in height of the interior.

In working on such lines the Italian architects were often not hampered by external considerations, elevations being the exception, as their churches are often situated in the centre of blocks of buildings. Moreover, even when isolated, the practice of the Roman, and also, we may add, of the Italian Gothic, architects had accustomed them to a considerable indifference in the matter of external effect. It happens with us, possibly owing to the majestic grandeur of St. Paul's, that the dome has come to be thought of as a great means of obtaining external effect; but a people familiar with the Pantheon as their master-work might well feel the influence of the dome in a different way.

Hence, in this essay we can, for this and other reasons, discard external considerations, and treat the subject from the interior, as a matter of plan or section producing an internal effect, which, however, in any genuine architecture, would never be out of relation to its external appearance. Such considerations may be left as belonging to the future possibilities of domical architecture. From the point of view, therefore, of the interior we shall agree that height, a leading feature in the mediæval vaulted interior, is destructive of the effect of space, the special character of the ideal dome, and that the constant reduction in that proportion is directed towards satisfying a desire for spacious effect. The problem thus became that of ousting the Gothic influence as a step towards the formation of a new system, whose principle might be that all coverings are domical and not cross vaulted.

This tendency to absorb the dome as a roofing principle led to fundamental changes in its nature. Being brought into relation with the whole plan, it is transformed in size and character. Harmony of dome and nave is obtained by reducing both to one key, from which a complex plan arises, as the minor parts must be also covered on a domical system, if consistency of structure is to be obtained.

In a domical church the problem of adjusting nave and dome is complicated by the necessity of avoiding too great a contrast of height. For while in a dome pure and simple the whole of the surroundings are merely subordinated to a grand effect of space and height, the domical church by its length upsets the balance and destroys that special effect.

Given a long nave with one or two domes in its length, the resulting vista down the church presents serious gaps, due to their height, and to remedy this defect a complete change of character was brought about. The drum of the dome is first given up, then its section is lowered to a saucer shape, and finally it is amalgamated with its enclosing arches. This last process is based on the principle that every plane section of a sphere is circular, consequently the dome is no longer bounded by the enclosing square on plan, but these four arches are really sections through a dome of much greater diameter. We might say that the dome springs with the enclosing arches, and that the pendentives are abolished, being now, in fact, portions of the sphere itself. This particular process of domical treatment I propose to identify throughout as "the surface vault," being a term expressing something of its special effect. By this method a great reduction in height is secured, while the domical principle remains, and the effect is perhaps more characteristic than if, pendentives proper being retained, a segmental saucer be sprung from the crowns of the enclosing arches, which is the only other way of securing a similar result.

This absorbing of the dome as a system of covering may be usefully connected in idea with that characteristic of Roman plans, wherein walls of immense thickness seem to have had dug out of them the minor features of their exedras and recesses. I shall return to this point later on when dealing with St. Andrea at Mantua; here I wish only to draw attention to the analogous way in which the timid openings in the square piers of a Byzantine church, such as St. Mark's at Venice, are transformed into the minor compartments of the five-dome plan. In this there was a principle capable of expansion, for the dome is then carried on open piers related in covering to itself, like parts of a completely domical structure; as under the Gothic system, the cross-vaulted bay of the aisle responds to wider and loftier compartment of the nave. This may be said to be a departure of greater promise than that shown in the early form of dome church, as St. Andrea at Mantua, whose plan is that of one dome supported on the barrel vaults of nave and transept, and whose length is simply destructive of the main feature to which they are intended to belong. It was an advance in one way to place the Pantheon on to a vaulted hall of equal scale, but it was also spoiling both. It is a greater step to bring both into harmony, and this it was the main effort of the Renaissance architects to accomplish.

The problem, then, of the domical church is this relation of space and length, and it has been partially solved by a reduction in height. This was a gradual process owing to Gothic influences, and to a desire now and again predominating to obtain a commanding external effect. As regards the interior even, it may be conceded that the dome reduced to a surface vault, drumless and pendentiveless, loses something of its character, but the gain lies in the binding together of the parts, so that the great arches are of the dome, and the dome of the whole church, while by the introduction of minor domed compartments scale is obtained and the general system begins to approach the harmony of the Gothic scheme. It is not pretended that the forms described were new, as they may be found in Roman and Byzantine buildings; but that does not detract from the value of the work of the Renaissance architects, who were attempting to fuse them into a new system.

Moreover, Renaissance art, being essentially individual, examples cannot be followed out in that sequence we may find in mediæval architecture; but though some type may appear in advance, or be carried out with a knowledge and certainty beyond that of a work of almost the same date, still a general tendency can be traced with sufficient clearness, and may be followed up with advantage.

Many of the forms and features described may be traced, often crudely, in the studies of the first architects of St. Peter's, as given in Baron Geymuller's book on that subject. Thus Antonio Sangallo's "Study for a Nave" shows a treatment of domes on the surface vault plan which is highly interesting. One may, however, suggest a caution not to look at such sketches too much in the light of subsequent knowledge, or we may be attributing to their authors a more advanced skill than their work would have displayed had it been executed.

Type I.—The Domical Church.

We enter then upon the consideration of our first type, that of churches more or less completely designed on a domical system, after having cleared the ground by the foregoing preliminary consideration of some of the elements of domical architecture.

The church of St. Andrea, at Mantua, begun by Alberti in 1472, is remarkable in the history of art as the first modern church with a dome. The reason, however, for including it in this place is, that its system of enormous walls, within which chapels are, as it were, dug out, brings it into relation with the plan of carrying domes on pierced square masses, which has been already discussed. In St. Andrea the side chapels are arched over below the entablature, which carries a continuous barrel vault, and the pierced square, having only small doors of access, form no part of the internal effect. They are thus waste space in fact, while preventing any circulation outside the nave. These compartments, moreover, must be as high as the chapels themselves between, unless a minor gallery were arranged over them, somewhat as in the Jesuit church at Rome.

It is not too much to assert of this example that the plan is eminently one awaiting expansion, and that it possesses a high value as an originating work. St. Andrea is a church, moreover, which must be seen for its effect to be fully realised, otherwise it is hard to understand why it is one of the noblest of all the Renaissance churches, possessing some magic of simplicity and proportion, which affect the spectator with a dignity and grandeur that might not be appreciated from a mere inspection of the design on paper. In its enormous solidity of construction it is a direct outcome of the revived interest in the grandiose ruins of Rome.

The Carmine Church at Florence is an instance of a similar but reduced treatment of thick walls and a single nave. The supports in this case are smaller, and the chapels are made perhaps more useful in the general effect by their half-dome heads carrying up the eye to the main vault.

The æsthetic difficulty of the single span church is the tendency of the walls to lean outwards in appearance, and the partiality of the Gothic builders for arcades has been ascribed to a perception on their part of the correcting influence of curving lines. Consequently the treatment in this instance is a good example of what may be done in such cases, while the alternation of solid and void in good proportion is the probable explanation of the appearance of great size which the nave of the Carmine Church possesses.

St. Giovanni Battista, Pesaro (by G. and B. Genga, built in 1540) shows the other type of internal buttressing. The well-known church of the Redentore, Venice (1576, Palladio) has practically this plan, but masked by the use of the revived orders, the side chapels becoming the deep arches of a Roman arcade, from the Coliseum.

This digression on the simpler problem of the one-span church has its use in that our first type, "the domical church," is a derivative of the large hall, without however reaching a stage of greater development until, by the formation of aisles, the problem becomes complex. It is the call to adapt the dome and the traditional church plan that is responsible for the more interesting attempts that followed. There are in Italy and elsewhere a number of Renaissance interiors of the normal Latin cross plan without aisles, which most often are replaced by side chapel recesses. Such examples, though possessing a dome at the crossing, are not domical churches proper, but from them there is a development, perhaps best illustrated in Rome, in which these side chapels are enlarged to squares, and carried up for separate domical treatment, as in the Church of the St. Apostoli (by Fontana, built in 1702-24). Remarkable effects of lighting can be obtained, where these compartments are top-lit, but the general unity of the interior is broken up by such semi-isolated features. The great height of the bays of the side aisles of the nave of St. Peter's (1606-12, Carlo Maderna) shows an approach to this idea.

The plan of St. Carlo in the Corso (1612, Onorio and Martino Lunghi, architects) is as though such a series of chapels were thrown together to form a wide aisle in front of the usual chapel recesses, the passage way being carried right round the semi-circle of the apse. Each domed compartment is separated by bays, the width of the arcade piers, and in working round the apse the cupolas become oval in plan, while the separating bays are slightly radiating. As is well known, the application of the dome solves in the easiest way some of the problems of chevet vaulting.

It is worth while to mention this example when considering the subject of domical churches, because the wide aisle has been a subject of experiment in modern work, on account of certain advantages in seating accommodation, and it is conceivable that the domical idea could be well utilised in such a type of interior. The aisle question will be found to exclude large batches of domical examples of more than one period and style.

St. Salvatore, at Venice, commenced on a scheme by G. Sparento, approved in 1506, was carried on and completed by Pietro and Tullio Lombardo in 1534. It is the largest and most important of a series of studies in the application of the dome, the outcome of the influence of St. Mark's, and probably of other smaller churches in Venice of that period and character. The centre of St. Mark's was seen to constitute a complete conception in itself, and the expansion and development of the Byzantine model was followed out by the Renaissance architects in Venice—the square pier masses which in St. Mark's and other examples of the style carry the domes, are cut away to mere legs, leaving a good aisle on either side of the nave, but the treatment in detail is such as to retain their character as supporting piers. Internally they are domed either with surface vaults, as in St. Giovanni Grisostomo (built in 1497-1504 by Moro Lombardo), or have cupolas sprung from a string over the arches, as in St. Salvatore. These piers are the key to the whole interior, as a definite relation should exist between them and the main dome, both in scale of plan and in height of section. This is a consideration further dealt with in the second part dealing with the five-dome plan. St. Salvatore, though a small church, is remarkable for structural harmony and elegance, due, probably, to the almost exclusive use of the dome as a covering agent.

This church is supposed to have exerted considerable influence on St. Giustina at Padua, the model for which, by St. Alessandro Leopardi, was accepted in 1521.[*] On his death in the latter half of 1522 or beginning of '23 the work was continued, but it seems likely that changes, at any rate in the detail, were made. Andrea Morone, engineer, who was appointed in 1532, is responsible for the upper parts. There is a heavy and clumsy character about the work which it is difficult to associate with the architect of the Colleoni pedestal, and the mast standards of the Piazza at Venice, also works by Leopardi. It would seem as if the scheme of St. Giustina had been biassed by the designs for St. Peter's, founded in 1506; as though it were a compromise between the development proceeding in Venice, and the more grandiose ideas current in Rome. The defect of the Paduan church is that its length is obtained by the crude device of repeating the main dome three times down the nave, of the same diameter, but very much lower in height. The nave domes are divided from each other only by a single pier with narrow arch band. This pier is buttressed by an arcade across the aisle, and has the effect of a mere partition wall, while the central dome, though of equal span, has a compound pier and ample width of barrel vault to rest upon. This is an inadmissible distribution of the supports from an artistic point of view, the nave appearing too light in effect, while the crossing seems clumsy. There is, in fact, a want of unity in the plan, which may be broken into two portions.

The five-dome treatment of the crossing resembles that of St. Maria Campagna in that the four minor domes are shown outside, the resulting height producing internally a most well-like effect. This church is notable in that it possesses some degree of external effect. The west façade is still in the rough, but the nave outside is treated in what may have been the style of the Roman Thermæ, and being in simple brickwork is not ineffective, presenting perhaps an idea of what those great Roman buildings may have looked like, supposing that they were left unplastered.

The church of the Benedictines St. Nichola at Catania, is on very similar lines to St. Giustina, but is better worked out in detail. The division between the two domed bays of the nave is here much strengthened, while the single instead of double setting out of the side chapel is more in harmony with the scheme of the plan. This church is on a great scale, about 350ft. by 210ft., producing a striking internal effect with some perspective capabilities. Built 1558 to 1578 by P. Valeriano, of Catania, it was restored on the old lines a century later by Gian Battista Contini after an earthquake.

The Duomo, at Ferrara, is an old building modernised to the design of F. Mazzarelli in 1637 and carried on from 1711-28. It displays several features which illustrate the study upon which we are engaged. At once more complex and interesting than the other examples, built on an oblong site, lit almost exclusively from a clearstory, this building affords an instance of what may be done with a town church on an ordinary plot. There are three internal transepts, each marked by a dome, the intervening blocks being treated on the Gothic plan of oblong bays in the nave and squares in the aisles. There is, however, a minor difference in the setting out, for a kind of lateral perspective has been obtained in the plan of the piers, such as may be seen in Bramante's architectural background to Raphael's fresco of the School at Athens,[*] but which has not, so far as I am aware, been realised elsewhere. It is an effect especially suitable in a Renaissance church, on account of the stability that it suggests, preventing too many cross views, as well as that slender pillar effect which distinguishes a Gothic interior.

That this last point is a danger to be avoided in Renaissance churches is seen in the earliest examples, as St. Agostino at Rome, the cathedral at Pienza, &c. In such early instances the Gothic plan is merely clothed in classic detail, as in the piers which become four pilasters back to back, of inordinate proportion, in spite of the use of pedestals, owing to the attempt to reach up to the cross-vaulting at the usual level of a mediæval interior. Such an effort is not aided by the small rise of the round arch, as compared with that of the pointed form.

Returning to the consideration of the plan of the Duomo at Ferrara, an explanation may be due to those who are at home in vaulting problems, and who may be wondering how the oblong nave bays are ceiled. The groins are not ellipses, nor do they twist, but the covering is circular barrel vaulting, with intersections for the windows, the wall arches being run on to the main vault at the crown level, or nearly so; the half groins, however, are not in one plane, as the halves of a diagonal rib would be, the junction being concealed by the decoration. These wall arches, moreover, are sprung high up off the vault itself. Undoubtedly this is rather a trick, but, when one remembers the difficulties of roofing such oblongs with round arch vaulting, one can only be amused at the ingenuity displayed. The aisles are domed with surface vaults, adding much to the sense of apparent stability in this church. The lighting of the building is remarkable, proceeding almost entirely from the intervening blocks on their three sides, through a clearstory over the aisle, the domes being windowless, with a very good effect as regards the light and shade of the interior.

Unlike many examples, this of Ferrara has the advantage of conforming to the *doctrinaire* rule that the dome marks a resting-place, for here each distinguishes a transept, and is also a point from which seven altars are visible at once, being an effect sometimes arrived at in modern Roman Catholic churches, as in the crypt of the Sacré Cœur at Montmartre. This result is obtained by an attention to cross views not common in Renaissance interiors.

The question, however, of the impolicy of using domes at other than points of rest is really one of vista, it being assumed to be unpleasing to look down a series of domes; that is to say, it is the structural question of the dome section, for while domes of the pendentive and drum types are apt, by rising high above the enclosing arches, to make awkward gaps in the line of the covering; saucer domes and surface vaults are not so open to objection, being lower in section and more in harmony with the arches that contain them.

Undoubtedly, however, the question of vista is of the greatest importance. For instance, in this very example, on looking down the length of the nave, the three domes, or rather the two beyond us, occurring after the cross vaulting between, tend to leave the end arches of each block without apparent support. This effect occurs also in Gothic cathedrals whose crossing carries a lantern. In the latter case a remedy has sometimes been found in vaulting the crossing level with choir and nave, which, of course, at once extinguishes the problem. In this instance the use of saucer domes, or surface vaults, for these transept domes would have removed the effect of the gaps to a large degree.

Considerations of vista are also a reason for the level ridges of an English Gothic vault, in that the effect of length is best produced by providing a line for the eye to travel along, and that of the vault crown is one of those most naturally followed. In wooden roofed interiors, ridge rib and purlins effect the same object.

Ribs are not at first sight a promising idea in connection with domes, though there are cases, where the use of strongly marked ribs, as in St. Maria di Gradi at Viterbo, built in 1740 by Salvio Niccolo, carried up from the angles of an irregular octagon or other form on which the dome rests, still leaves something of the special dome effect, such as might not be entirely lost if a system of wide bands down the centre were used, leaving circles to occupy the spaces at the sides.[*] The introduction, however, of all ribs in domes, while often producing a ceiling of powerful effect, seems to destroy those special qualities of the sphere as a covering, which count for so much in the attractiveness of the dome as an architectural feature.

From the point of view of a domical church there is a certain imperfection in combining, as in this church, domes with cross vaults, one being a surface and the other a line treatment. St. Paul's presents a clever compromise in this respect, as in the nave the oblong bays are covered by saucer domes which rest on the cross arches at the ends, while on the sides they are supported by the groins of an interpenetrated cylinder. The defect, however, follows that the sides appear insufficiently supported by the thin line of the groin, as compared with the ends carried on the strong cross arches. The wreath band at the base of the saucer dome, while exaggerating the point, seems required to emphasise the cupola form.

The plan, however, of St. Maria di Gradi shows that the two cross-vaulted bays of the intervening blocks between the transepts could very well be treated as one composition, either domed with a saucer or covered with a barrel vault. Of this there is an instance in the Badia di St. Flora at Arezzo, built in 1550 (?) by Vasari, in which the treatment below the vault is as a Palladian bay of two free columns and a central arched opening carrying a small oval dome across the aisle. Emphasis is thus given to a side altar. The tendency to setting out in square bays, in domical work, is directly manifested in the greater harmony of the Badia scheme.

We shall conclude this part of our essay, dealing with Type I.—the Domical Church—by a reference to St. Fedele, at Milan (built in 1569-79, by Pellegrino Pellegrini). This is an instance of the application of the surface vault and a single span nave, bringing this church into comparison with those of St. Andrea and the Carmine, with which we started. It illustrates also how in the Later Renaissance a treatment of columns as orders on stricter Roman lines was attempted. In this instance the columns of the main order are used as vaulting shafts, as in the Thermæ, though with a closer adherence to rule than probably distinguished the works of the Romans themselves. We may consider this example as the model of the Madeleine, at Paris, though the covering in that case is by pendentives and top-lit domes. Aisles in this type can be obtained by bringing out the order free from the side wall, and covering the passage by a barrel vault from column to column, as in St. Quirico at Siena. A good abutment is thus obtained where the side walls are thin.

---

[*] Osvaldo Parletti.

[*] Usually considered to represent Bramante's ideas for a St. Peter's, with a nave on the basis of a Latin cross plan.

[*] French Gothic vaults, where treated with English ridge ribs, produce a somewhat wavy effect owing to the rise and fall of the ridge, although this is not so noticeable as might be expected.

Second Type.—The Five-Dome Plan.

We now proceed to take up our second type, differing from that which we have been considering in this important respect—that the five-dome plan constitutes an isolated and self-contained building, and retains rather more of the original dome effect, possessing as it does a central and dominating, cupola-covered area. It is, perhaps, the most satisfactory development of the simple domed apartment of the type of the Pantheon, as it is free from the complications that arise with attempts upon an octagonal basis.

I have already alluded to the relation between these examples of our second type and the Byzantine model, as in St. Mark's, Venice, and also to the process of opening out the square supporting masses as minor domed compartment of the plan. The barrel vaults that bind these squares together agree well in idea with the main dome which they carry, being, in fact, only arches of an ampler width, insuring a greater sense of stability.

The system as a whole tends to lower the interior, as the pier compartments, as hollowed out, must not be too high internally, while the existence of much space above would call for an upper storey, also domed, such as, indeed, might well exist, in relation to a system of internal galleries of a structural character. In St. Salvatore the space above is disposed of as a panelled attic, the lines of which range round the whole interior.

In applying the classic features to this type of plan, the legs of the piers become naturally the main pilasters, enclosing a minor order carrying the small arches of the internal dome, this treatment agreeing well with the ideas of Bramante and Palladio. In certain examples these minor domes have drums, and show outside as turrets like in Santa Maria Campagna at Piacenza, and St. Guistina at Padua; but in St. Salvatore at Venice the drum is omitted, the dome springing from a string just above the heads of the small arches, which were united by pendentives.

By the use of the surface vault, as already explained, a still further reduction of height can be effected. The same course can be adopted with the central dome, as in St. Rosa, by which means the whole interior may be brought to a unity and spaciousness of effect such as the first efforts could not attain, owing to their excessive proportions. There are cases, of course, where the five-dome plan might be used for the opposite quality, should a frankly tower-like result be desired, for if sufficient altitude were given to the minor domes, the central feature could be carried to an otherwise unattainable elevation, producing a strong impression of height, but at the expense of what are generally considered to be the special characteristics of the dome.

The Fortezze Church at Viterbo, dedicated to St. Francesco e Paolo, is just outside the walls of the town. It was built for one of the Farnese, who were great patrons of the architect Vignola; he was, in fact, building Caprarola for them between 1555-9 in the same neighbourhood, so that the attribution of this work also to him is not unreasonable. The exterior is unfinished, and the interior rather rough, though not wanting in dignity. This example is interesting in our enquiry, because in the same town is St. Rosa, built in 1848, of almost the same dimensions, but of an entirely different internal effect.

The quality of space tends to disappear when much height is given, and not only are the minor domes of St. Rosa proportionately less in height, but the surface vault principle being applied to the main dome, a great reduction in the total height is obtained on a similar plan of nearly equal dimensions. The greater effect of spaciousness obtained is very much more than is accounted for by the actual difference in size. Some part of this is due to the greater attention bestowed upon the minor domes, and to the attempt that has been made to bring them into closer relation with the central area. The modifications introduced into the plans of the main piers are in this direction, and also in that of providing a better seating for the start of the domes. It will be observed that the minor domes might have been treated as surface vaults, reducing their height, with a probable gain in spaciousness of effect to the whole interior. The aim in a church of this type must be to get good cross views, and a perfect relation between the central and minor domes, in which respect the relative bulk of the four great piers is a matter of primary importance.

The church of St. Maria del Letto at Pistoia (about 1509, by Ventura Vitoni), shows that a tempting solution of this side of the problem was not untried. It seems easy to replace the piers by four single columns, giving a practically unencumbered square interior, while carrying on them the vaults and domes above, as we find done in Byzantine examples, or in La Martorana at Palermo, in which last pointed arches are used. Renaissance examples also are to be found, in which single columns are used, and one in which a group of four half-columns fused together forms the pier. The drawback to this single column plan lies, however, in its excessive simplification, by which it loses interest, a single glance reveals the whole interior, and also seems to stamp the upper part as somewhat of a fraud, so much architectural scenery above with so little apparent support below. Whereas the pier system, at any rate, has more reserve and mystery, while the unity and relation of parts can be equally well preserved, and above all it has that air of stability which constitutes so large an element in genuine architectural effect.

When the Santa Maria del Letto type is extended on all sides, still using columns, the plan of St. Stephen's, Walbrook, is approached, as the formation of a central octagon by the omission of the four middle columns becomes necessary to secure the relative increase of importance to the dome. We have, in fact, a hall of columns to which a cupola is applied in order to secure a free central area. The type is essentially a compromise owing to the tendency in the spectator's mind to restore the omitted columns, an impression probably arising in part from the difference of scale between the small bays of the colonnade and the wide central area.

It is interesting to remember that Palladio's favourite form of vestibule is a hall about thirty feet square, having four columns about five feet out from the angles. In his designs the central area thus formed is usually cross-vaulted, leaving flat ceilings for the angle squares; but with a domical treatment the five-dome plan is obtained, and would be equally palatial in effect. This is recorded, in passing, as an illustration of the domestic application of this type.

El Sagrario, at Granada, a Spanish example built in 1705-59, approximates in scale of plan to St. Francesco and St. Rosa, but exhibits a wide variation of internal section. In this instance height has been striven for, and attained by making the interior practically in two storeys, the minor domes being lifted above the main order. The chief peculiarity, however, is that the minor cupolas are placed at the cardinal points of the main dome, the angles being cross vaulted. The plan obtains considerable extension of a series of deep recesses in the external walls, and by adding to this a relative smallness of features, the impression of a large church is produced. In comparison with St. Rosa, it is interesting to observe that the central squares of both are of the same dimensions, all the increase of size in the Spanish example being given to the surrounding areas. The surface vault, however, of St. Rosa conveys an idea of a dome of much greater diameter than in El Sagrario, where the greater height also detracts from the importance of the central feature. If the system of the Spanish example were carried to its logical development the effect of a square hall would result, the lofty piers becoming incidents in the interior, while the minor domes, acquiring the importance of the central feature, would seem to be parts of one comprehensive domical covering. The arches in three tiers in the side sections, rising from the wall recesses to those which carry the vaulting of the angles, and on up to the arches of the minor domes, constitute the best feature of the scheme. The many breaks in the detail are characteristic of the Spanish use of the orders.

The church of Madonna della Steccata at Parma, built by Giov. Franc. Zaccagni from 1521-39, is like the Invalides at Paris and churches of that type, in that the angles of the plan are not brought in as parts of the general effect. This is especially the case in this instance, as the only openings are small doorways, thus reducing the plan internally to a simple Greek cross, like the church of St. Maria Carceri at Prato, a type which it is not our purpose to discuss. An interesting point about this example is the greater attention bestowed upon the exterior, and the fact that the cupola drum is surrounded by an arcade in place of the more usual colonnade, while the curve of the interior and exterior dome are almost the same.

In the church of Santa Maria Campagna Piacenza (1522-28), attributed to Bramante, the angle domes are carried up as turrets outside, with the usual loss of internal effect. The exterior is an interesting piece of brickwork, rigidly following the lines of the interior design. The five-dome plan is here extended by barrel vaulted bays on all sides, giving length and a transept effect; while the diamond, on which these plans naturally shape themselves, falls within the walls of the church. Except for a gain in cross views and accommodation, the architectural effect is not much improved, though, of course, greater height can be indulged in with success.

There is a diagonal line to be applied in section, as well as in plan, when determining the height of these interiors. The most suitable point to consider is that at which the circle of the dome lantern, or the apex of the cupola, is to be cut off by the cornice of the springing, or by the crown point of the enclosing arches. The same consideration applies also to the minor cupolas. The next important station point is that in the extreme angles of the plan, from which the relative bulk of the great piers can best be appreciated. The plan of these piers is, therefore, a point of great interest, for, obviously, on that depends the extent of the cross view of the interior as a whole, as well as the appearance of adequate support for the superstructure.

The first improvement on the simple early form of a square recessed pier is to cant the angles towards the smaller domes, as is done slightly in San Francesco, and rather more in St. Rosa; the piers of Santa Maria Ghiara at Reggio (built in 1597 by Alesso Balbi) have very large cants to these minor features. When the domes are surface vaults, the cant is like the start of the cupola, and where a pendentive is used it acquires greater importance beginning in that way than when it commences from nothing in the internal angle of the pier. A large cant to the main dome characterises the Spanish example, El Sagiario, which has also the arch bands of the minor domes doubled, as occurs in late instances. A form of pier of a different character is obtained from the column type, as in St. Maria del Letto, when minor arches are introduced under the entablature, so that the order becomes one quarter engaged. There was an example by Sansovino, St. Geminiano, Venice (1556), now unfortunately destroyed, of about the same scale of plan. The column on the angle of the minor squares is an effective feature, though with any close adherence to the Order system certain detail difficulties would have to be faced, which probably accounts for the rarity of this type. The great development of pier in St. Alessandro, Milan, obscuring the angle domes of the plan, exhibits a tendency backwards to the plan of St. Peter's at Rome, as it now is, with its isolated angles and absence of cross views. We have not in this essay to deal with questions of architectural detail, but we may say, in passing, that these piers belong to that late phase of the Renaissance already alluded to, when an attempt was made in using the orders to give them a separate character. This idea was expressed in various ways, but the plan of inserting a complete column, and forming a recess behind it, as in this example, was a favourite expedient.

The complications of the Order system are possibly more felt in the second type than in the first, as the same need for the vertical lines of pilaster and column is not experienced in the five-dome plan as in the domical church.

St. Alessandro, at Milan (by L. Binaghi, built in 1589-1602), may be described as belonging in part to both of the selected types. It exhibits a skilful extension of the five-dome plan eastwards instead of westwards, as is the more common. By this means on entering we realise at once the full effect of the main dome, unweakened by any preliminary extent of nave, while the second impression of length beyond is pleasing and the manner is good, as the second dome repeats the first but in saucer form, wisely attempting no second effect of height, and the vista then closes in with the natural termination of an apse.

Without entering on a third division of the subject, we will glance for a moment at the later stages of the domical architecture of the Renaissance in Italy. We have alluded above to a late form, in which irregular octagons are domed with strong ribs from the angles, as somewhat converting the dome into a vault in effect, though still leaving something of its special character. There is considerable boldness of effect in some of the later examples of this type, as S. M. di Gradi, Viterbo (built in 1740 by Salvio Niccolo). S. M. Vita Bologna (1687-1787, G. Borganzoni) is an instance, but with the plan enclosing an oval shape, such as in the last period became a marked feature.

Such oval churches as S. Pietro e Paolo, at Ceriano (1670-1679), and S. Maria Prato, at Gubbio, are interesting in the present day, because experiments have been tried quite recently in oval interiors, and the geometrical and structural aspects of the problem can be observed in these old examples, bad and unsuitable as their details may appear. A special study might well be given to this type on that account.

Of the hexagon variety, S. Giovanni Evangelista, at Orvieto, is an example; while the curious late attempts to, as it were, square up within an oval circumference a central circle or square, with annexes reaching towards the boundaries of the enclosing curve, are illustrated in the Church of the Madonna di S. Luca, at Bologna (1731, C. Dotti). The Madonna at Macereto, by a pupil of Bramante, is an earlier form, in which the central square and annexes are comprised in an octagon. St. Jean at Burgos is more closely connected with the five-dome plan, though the octagonal boundary has reduced the minor domes to triangular spaces of vaulting. The interior is spacious, and seen at a glance. The piers are tall and slender, almost to excess, while the dome is somewhat small, and tends to lowness of effect, owing to the proportionate increase of the surrounding areas. The use of the pointed arch to solve the difficulties of the triangular vaulting is a singular fact.

In conclusion, I have endeavoured to treat the subject of Domical architecture as a question of structure in an artistic sense, and of proportion both of plan and section, independent of what is called style. While details are decaying, form in structure may still be progressing, and the interest of the later examples is often due to an advance in the general handling of the problem. This progress may be lost sight of if we allow ourselves to be blinded by prejudice induced by the detail employed, more particularly in late examples of the Renaissance.

An instance of the independence of detail of these problems may be seen in the new church of the Sacré Cœur at Montmartre, which, though Romanesque in detail, belongs to our second type. Amongst other points this example shows how an increased height can be obtained in the minor domes of the five-dome plan by the simple expedient of forming openings with Welsh groins in the barrel vaults enclosing the dome, so that the space within the hollow piers is opened up. By this means the effect of an otherwise excessive height in the minor domes is obviated, and their area is included in that of the main structure. If, however, this process is carried too far the square hall effect is produced. Somewhat analogous is the treatment of angles of the supporting vaults of the Pantheon, Paris, though here carried out with an excessive lightness of pier, and in a somewhat disconnected manner, due mainly to the entablature of the order below.

The Roman Catholic Cathedral, in progress at Westminster, is an instance of the use of domes on a large scale, the nave consisting of three domed bays of 60ft. diameter. The side arches are here divided into two bays, as in St. Antonio at Padua, while structural galleries are obtained by arches on columns as in St. Mark's.

Many other developments are possible, and will occur in future examples of domical architecture. An irresistible tendency to development will be displayed in architecture when a start has been made on the lines of a possible system. The first experiments are often reckoned as failures, but the future is more indulgent than the present, and a consideration of their importance as links often gives a credit to buildings that might be denied to them solely on their artistic merits.

THE DISCUSSION.

Mr. Phene Spiers, in proposing a vote of thanks to Mr. Bolton, said he had had difficulty in trying to follow the paper, as he could not readily recall the churches referred to by Mr. Bolton, owing to the long time that had elapsed since he visited Italy. The domical church, as he understood it, was one in which the dome was the principal feature as at Santa Sophia in Constantinople, and not simply a covering over spaces.

Mr. H. H. Statham seconded the vote, and Mr. C. H. Brodie, in supporting it, could not help thinking, with reference to domical construction, what a splendid use of concrete and iron would probably have been made by Sir Christopher Wren, in building St. Paul's, if he had had these materials at his command.

Mr. G. H. Fellowes Prynne, in putting the vote, was very glad that Wren had not had iron and concrete; St. Paul's was one of the most perfect churches in proportion. Speaking of the dome, he could not help wondering why Gothic architects had not taken up the dome, which seemed to him to have the very essence of Gothic construction.

The vote of thanks having been carried,

Mr. Bolton, in reply, said he had expressly set aside such great domes as Santa Sophia. He meant by a domical church one in which the principal of the covering was a dome. To his mind a church with several domes in it was a very interesting study. He agreed with the president in objecting to the use of concrete and iron.

Dumfries and Maxwelltown Public Library Plans Competition.—In this competition thirty-one plans were lodged with the committee of the joint Councils, eight of which were measured. The plan of Mr. A. S. Crombie, Dumfries, was selected. The professional assessor, before measurement, placed the plans in the following order of merit:—First, Mr. Frank Carruthers, architect, Dumfries; second, Mr. Rupert Savage, architect, City Press Chambers, 148, Aldersgate Street, London, E.C.; third, Mr. James Crombie, architect, 25, Ramsay Road, Brixton, London, S.W.; fourth, Mr. Alan B. Crombie, architect, Dumfries; fifth, Mr. James Chalmers, architect, Central Buildings, 93, Hope Street, Glasgow; sixth, Messrs. A. B. Robb and F. G. Grierson, architects, Imperial Buildings, Ludgate Circus, London, E.C.; and the committee added those of Mr. John A. Campbell, architect, 44, West George Street, Glasgow, and of Mr. Thomas Martin, architect, Leeds.

LONDON BUILDING IN 1899.

ALTHOUGH few very important buildings were completed in London last year, a commencement has been made on several schemes of considerable interest. The chief of these are the new Government buildings in Parliament Street and the Victoria and Albert Museum at South Kensington. The buildings of most interest completed last year, were, perhaps, the Tate Gallery and the north block of the new Admiralty. The Tate Gallery has been enlarged greatly, and the new sculpture hall is already in use; the new Admiralty block, although completed, will not be occupied for another six months, when it is to be hoped the old houses in Spring Gardens will be pulled down and the Mall opened into Charing Cross. The new block of the Record Office is now ready, and the strip of ground at the back has been converted into a very effective little garden.

Last year has been a year of theatre building. In central London Wyndham's new theatre has been erected, and opposite it the new Hippodrome, largely masked by a lofty block of shops and offices. The suburban theatres have been increased by one at Ealing, the Duchess Theatre has been built at Balham, a fine Moorish-looking one on Richmond Green, and the Terriss Theatre at Rotherhithe. The Empire Music Hall has been built at Holloway, another Empire at Deptford, while the Bedford has been rebuilt at Camden Town.

This has also been a year for hospitals. The new City Ophthalmic is a fine brick building in the City Road, while the Gordon Hospital is housed in a separate new edifice in the Vauxhall Bridge Road. The City Orthopœdic in Hatton Garden, and the Alexandra Children's Hospital in Queen's Square have been rebuilt; while the Middlesex and London Hospitals have built medical schools and laboratories. Queen Charlotte's Hospital has been considerably enlarged, and a fine brick Nurses' Home erected opposite. Westminster, the Royal Free, St. George's and other hospitals have made extensive alterations and additions. A pretty little Gothic cottage hospital has been built as a Jubilee memorial at Woodford, and the British Institute of Preventive Medicine in the Grosvenor Road.

A building often mistaken for a hospital is the new Marylebone Workhouse, with its handsome brick and stone front. A Passmore Edwards' Free Library has been built in the Borough Road, and a Newnes Library at Putney. Penge also has a new library, and a teachers' orphanage has been established at Sydenham. Public baths and workmen's dwellings have been built at Shoreditch, a fourth Rowton Hotel at Hammersmith, and a new fire station at Lewisham. King's College Schools have been removed from the ugly brick annexe at Somerset House, overhanging the Embankment, to Wimbledon Common, so there is no reason why this disfigurement to Somerset House should not be pulled down.

The last great trunk line (the Great Central) has been brought into London, and the station, with the vast red brick hotel in front of it, is a prominent object in the Marylebone Road. The City and Waterloo, the second electric railway in London, has been opened this year.

Noteworthy additions to the street architecture of London are the Carlton Hotel in Haymarket, W.; the River Plate House, in Finsbury Circus, an ornate stone building, the headquarters of the great South American companies; a fine block of brick and stone buildings on the site of Bedford Chapel, another at the Oxford Street corner of Southampton Row, a third close to the Soho Bazaar, and another block nearly opposite. The stucco front of a well-known Regent Street fruiterer has been changed into a stone one. The Queen's Hotel in Leicester Square is a fine building of white stone, while the café next it is resplendent with gilt carving and gilded domes, quite changing the appearance of that once depressing region. At Knightsbridge the extensive premises of Messrs. Woolland form an exceptionally fine block in white stone, with much ornament.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

MODERN LONDON BUILDINGS.

NORWICH.—C. O. W. writes:—"Would you kindly inform me whether there is any book published which is copiously illustrated with photographs of the most important buildings of architectural interest in London. I find that in most books on the subject the reader is referred to examples in London."

No such book has been published on modern London buildings, but the following may be found useful: "Modern London Buildings: The Institute of Chartered Accountants. (John Belcher, architect)." £1 1s. (Batsford). Perhaps Messrs. Bolas and Co., of 77, Oxford Street, W., could supply you with photographs of the buildings you desire.

IMPROVER'S SALARY.

DROGHEDA.—CELT writes: "What salary should I ask on going out as an improver of about three or four years' experience? I can colour, trace, prepare plans from rough sketches, and prepare specifications, and can also do general office work and correspondence. I think yours a most valuable journal."

This is a very difficult question to answer, as so much depends upon circumstances, such as the cost of living and the age and ability of the improver. Generally speaking, it is best to accept a small salary, just sufficient to live upon on the smallest scale—say 25s. a week in London—and to move from office to office about every six months, varying the experience as much as possible, until a good salary can be justly claimed for a permanency.

G. A. T. M.

BOOKS ON DOMESTIC ARCHITECTURE AND ALPHABETS.

PUPIL writes:—"I should be glad if you would kindly recommend me a good book on the different styles of domestic architecture, and also one on ornamental lettering suitable for architectural drawings."

The following will doubtless suit:—"Analysis of Ancient Domestic Architecture in Great Britain," by F. T. Dollman and J. R. Jobbins (2 vols.), £2 2s.; "History of Renaissance Architecture in England, 1500—1800," by Reginald Blomfield, M.A. (2 vols.), £2 10s.; "Details of Gothic Architecture," by J. K. Colling (2 vols.), £2 2s.; "Alphabets Old and New," by Lewis F. Day, price 3s. 6d. net. The foregoing may be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C.

STIPULATED CAPACITIES OF FLUSHING CISTERNS.

LONDON, N.E.—T. R. T. writes:—"Will you kindly let me know what is the smallest cistern that can be used with a valve closet. Will two gallons, the amount the water companies specify, be insufficient?"

A two-gallon flushing cistern (with after-flush) is the smallest size that should be used with a valve closet, and, if a cistern of good type is selected, will prove satisfactory. From a sanitary standpoint, it is in every way desirable to use a three-gallon flushing cistern when practicable, so that the volume of water may be sufficient not only to thoroughly flush the basin, but also to carry the fæces through the trap and branch drain, whilst at the same time providing the necessary after-flush to properly recharge the closet basin. As, however, the regulations of many water companies require that the quantity of water used for closet flushing purposes shall not exceed two gallons per flush, a two-gallon flushing cistern is the largest that can be used in such cases.

T. E. C.

LAYING OUT STREETS.

HEXHAM.—A. Z. writes:—"I am laying out a building estate, and on one of the boundaries to which the street runs parallel the adjoining owner (who intends laying out his land at an early date) would not agree to lay out the street that adjoins his land so that we may each give up half. I, therefore, sent in my plans showing 18ft., half the required width (36ft.) and the U. D. C. have returned the plans to have the full width shown. I am depending on the case Regina v. Thompson. Model by-laws are in use. Is there any other case against me?

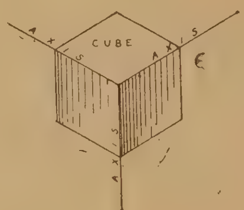
The case of *Gozzelt* v. *The Maldon Urban Sanitary Authority* (Law Reports: I. Q. B. D., 327 [1894]) appears to support our correspondent's view, and we are not acquainted with any decision which directly opposes it. He may argue the question with the local authority, but should not build in defiance of them, unless he is prepared to incur legal expenses.

G. H. B.

AXES OF A CUBE.

BIRKENHEAD. — DUNDIRNODDLIS writes: "What is the 'axis' of a cube? Is it the line joining the centre of two opposite faces, or is it the diagonal of the solid?"

By definition, "the axis of any geometrical solid is the right line which passes through the centre of all the corresponding parallel sections of it." This would make the axis of a cube either the lines joining the centres of the opposite faces or the lines joining the diagonally opposite solid angles, and the isometric axes correspond to the three edges meeting at either solid angle, so that it will depend upon the context what is meant by "axis of a cube." In the absence of context it would presumably be a line joining the centres of two opposite faces. The accompanying sketch shows a cube in isometric projection with the three isometric axes making equal angles of 120deg. with each other.



HENRY ADAMS.

ESTIMATING FOR PLASTERERS' WORK.

LONDON, N.E.—F. B. writes:—"I shall be extremely obliged if you can give me some information concerning the estimating for plasterers' work—the method adopted for pricing, both for solid and fibrous plastering. Can I get a book on the subject?"

The art of estimating for plasterers' work can only be acquired by practice and a knowledge of local wages and cost of materials. Other important items are district, height of buildings, cartage, scaffolding, water, season of year in which certain classes of plasterwork, especially exterior work, are to be executed; class of workmen to be employed, and mode of payment. There is no book yet published, or likely to be, which treats exclusively on estimating for plasterwork. Approximate prices for plasterwork are given in all price books. Considerable help on this subject will be found in works on estimating, a list of which may be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C. Some useful hints will also be found in "Specification."

W. M.

PATCHES ON DISTEMPERED WALLS.

WISBECH. — T. B. W. writes:—"(1) The plastered walls of a new building were clearcoled and distempered in a sea-green tint, but patches of yellow have since appeared over the entire surface, more pronounced in some places than others. Ordinary stone lime was used in the plastering, and this appears to have disintegrated the colouring pigments. Can you explain precisely the chemical action that has taken place, and what other colours must be avoided on new walls? Also, must this distempering be washed off before any further coats are added, or could it be further clearcoled and distempered? (2) When building next the street or the adjoining owner, is it legal or customary to project the footings of the wall beyond the true boundary line, in order that the outside face of the superimposed wall may form the boundary line proper and that the wall may be centrally placed over its footings?"

As the yellow patches have appeared more pronounced in some places than others they are doubtless due to some foreign matter in the distemper. With the exception of oxide of iron, which forms only a small percentage—about 1 per cent—in stone lime, there is no other component part that would affect the distemper. If any foreign matter had found its way into the lime, the slaking, working up, laying and spreading of the stuff would have distributed it evenly, and, assuming that it had the power to cause a yellow colour in the distemper, the colour would have been uniform over the surface and not in patches. In the absence of samples of the plasterwork and the colouring pigments used for the distemper, it is impossible to state precisely the chemical action that may have caused the discolouration. In our opinion the whole of the distemper should be removed and the walls left clean and allowed to dry, and then, unless any defects or yellow discolouration in the plasterwork is noticeable, the distempering may be re-done, taking care that the clearcole and distemper are clean and of good quality, and that both are properly applied. With regard to the question of "footings," consult your local District Surveyor, and thus avoid the complication of building Acts, sections, sub-sections and by-laws, which vary more or less according to district.

W. M.

ROUGH CASTING.

CALCIC writes:—"I have some rough casting to do on brickwork facing west. Please say how a white ground, as matrix, with dark stone, should be prepared, best material, &c."

Obviously there is a mistake in this query. "Matrix" means a mould or a cementing material, and has no connection with a "white ground." Rough cast is executed by first cutting out the mortar joints in the brickwork and then cleaning and wetting the surface to give a sound key for the plaster work. For best work, two coats of lime and hair is used, and one coat for ordinary work. If the walls are damp or in a position exposed to wind or rough weather, a coat of Portland cement and sand, gauged one part of cement to three parts of sand, should be used. The stuff should be laid sufficiently thick to allow the shingles or other surface aggregate to have a key when dashed on. The surface should be laid fair and parallel with all wood stiles and bands, so as to obtain uniform margins. While the stuff is soft the shingle should be evenly thrown or dashed with a scoop. The surface of well-dashed rough cast is so evenly and closely filled with shingle that there is little or no plastered ground to be seen. The exposed surface, or protruding parts, of the shingle gives the colour. Shingles are generally used for the surface aggregate, but fine and varied effects are obtained by the use of various coloured stones, flints, shells, broken pottery, crushed granite, slag, spar, &c. A good white surface is obtained by the use of spar. Bands, margin and ornamental devices may be obtained by using a differently coloured aggregate to that used for the main surface. For ornamental devices the aggregate must be inserted singly by hand. Ornamental parts may also be cast and then fixed in a similar way to mosaic tiling.

W. M.

"The Garden" begins its new volume (the 57th) with more pages and more illustrations; the latter are excellent.

Views and Reviews.

MODERN HOUSE CONSTRUCTION.

This book, or rather collection of several books within one cover, has been rather unfortunately named, as the actual construction of a house receives comparatively scant attention, the greater part of the first volume and practically the whole of the second being devoted to sanitary work of one kind or another — drainage, plumbing, ventilation, lighting, and sewage disposal. Probably no better exposition of domestic sanitary work has yet appeared, and particular credit is due to the editor for the way in which the whole has been arranged and for the small amount of overlapping, of which a little is unavoidable when the several chapters are the work of different authors. There is also very little obtrusion for the purpose of its condemnation of that which is now condemned, so that it is practically impossible for a student to misinterpret or go wrong, everything shown being clearly described and excellently illustrated and entirely in accordance with the best modern practice. In the two-volume form it is bulky, and likely to be treated as a library book of reference only, and we much prefer it in the six-volume form in which it has been issued to subscribers, as being more handy if less imposing in appearance. M.

"The Principles and Practice of Modern House Construction." Edited by G. Lister Sutcliffe. The Gresham Publishing Company, 25, Farringdon Avenue, E.C., and 130, Bath Street, Glasgow.

A BUILDING TRADES "WHO'S WHO?"

The idea of this annual is distinctly a good one. But, having said that, we have mentioned all that is estimable about it. In a book with this title we expect to find all the leading men in the trade noted, but, instead, the majority of the biographical sketches are not of those in the front rank, by any means. The letterpress devoted to each is distended with a lot of uninteresting matter, which is still further reduced in comprehensiveness by the large size portraits introduced. To read the descriptions is to be impressed with the idea that each individual is more famous than his fellows. As a humorous work this book would no doubt achieve some success. We are told in the case of one gentleman that "the success which he has attained is due to his inventive genius and steady perseverance, and the record of his career presents a striking example of what can be achieved by the unaided efforts of a man determined to rise to the highest possible point." We shudder to think of what his efforts might have attained if they had been aided. While this gentleman reaches the "highest possible point," another fell so deep as 73ft., and "although it was believed the fall had killed him, he speedily recovered." This irrelevant matter is, we suppose, introduced to spread out the illustrations, but it would have been much better to have done without them altogether, or at least reduced them to a very small size, so as to enable a more comprehensive biographical list to be given. We learn from the preface that it is the earnest hope of the publishers of this annual "that for many years to come it may serve as a trustworthy guide and a valuable means of strengthening the bonds of mutual confidence and esteem uniting the various members of the building trades of the United Kingdom." We hope so too, but in its present form it is not likely to achieve that result.

"The Building Trades Annual: 1899-1900. Who's Who? A comprehensive series of Biographical Sketches." London: The Westminster Press, Ltd., Carteret Street, Westminster, S.W. Price 1s.

WORKMEN'S COMPENSATION.

This compact little volume should be of great practical utility to the building community. It contains all the cases in which the Court of Appeal has endeavoured to interpret that most obscure of enactments, the Workmen's Compensation Act; it adds a supplement comprising a few of the more important county court cases; it is enriched by notes; it includes a copy of the Act; and it is put together by Mr. Minton Senhouse, a jurist who has made this branch of the law peculiarly his own and whose treatise on accidents to workmen has been quoted with approbation by the Court of Appeal.

There is scarcely a builder in a large way of business who has not had, at some time or other, to consult his solicitor as to the Workmen's Compensation Act—the utter obscurity of which must be the first thing that strikes him in connection with it. It has been described as a budget of conundrums worthy of the interlocutor of a negro minstrel troupe. Its definition clause cannot be comprehended without reference to a basketful of other enactments—and can scarcely be comprehended then. Such ordinary terms as "railway," "factory," "mine," "quarry," are to be understood, not by reference to the Imperial Dictionary, but by reference to the Regulation of Railways Act, 1873; to the Light Railway Act, 1896; to the Factory and Workshop Acts, 1878 to 1891; to the Factory and Workshop Act, 1895; to the Coal Mines Regulation Act, 1887; to the Metalliferous Mines Regulation Act, 1872; and to the Quarries Act, 1894. And even when the Act gives a definition of its own, it sometimes entirely changes the established meaning of words; for instance, it defines a factory as including a "dock, wharf, quay, warehouse, machinery, or plant to which any provisions of the Factory Act is applied by the Factory and Workshop Act, 1895, and every laundry worked by water or other mechanical power." But who on earth would have supposed that a wharf or a laundry was a factory?

The Act applies to buildings. This some of my readers know to their cost. More correctly —for it is necessary to quote the very words of an Act which seems likely to be litigated word by word—it applies "only to employment on, in, or about any building which exceeds 30ft. in height, and is either being constructed or repaired by means of a scaffolding, or being demolished, or on which machinery driven by steam, water, or other mechanical power, is being used for the purpose of the construction, repair, or demolition thereof." The statute has not been in force eighteen months and yet this portion of it has given rise to endless litigation. For instance, does the 30ft. limit apply to a building in course of construction on which machinery driven by mechanical power is used for the purpose of such construction? The Court of Appeal said "No" (*Mellor* v. *Tomkinson*, 15, *T. L. R.*, 142).—Is painting a house repairing it? "No" again (*Wood* v. *Walsh*, *id.*, 279).—Is strengthening a completed building not in need of repair repairing it? "No" again (*Hoddinott* v. *Newton*, *id.*, 299).—What is a scaffolding? Is a ladder leaning against a house a scaffolding? "No" again (*Wood* v. *Walsh*, *ubi sup.*).—Are scaffold boards 8ft. high from the ground, resting on ledges secured to iron columns and supported in the middle by trestles, all within a building, a scaffolding? "Don't know," said the Court of Appeal; "but, as the county court judge has held them to be a scaffolding, we cannot say there is no evidence to support his decision." Then, among the "scaffolding" problems left undecided is the question whether the scaffolding should have any relation to the height of the building? whether there is any difference between "scaffolding" and "*a* scaffolding?" and, indeed, whether the term "scaffolding" can be defined at all. Lord Justice Henn Collins pronounced its definition to be impossible, but stated that it was possible to say as to certain cases that they fell within or without the Act. The best definition yet put forward seems to be that formulated by Judge Stonor, one of the ablest of living judges. He adopts the definition of the Glossary of Architecture, that is, "a temporary erection of poles, planks [cords], &c., for the use of workmen in building walls or executing any work which they cannot otherwise reach," "which" Judge Stonor proceeds to say, "is always secured and fixed, and not a temporary erection of two pairs of trestles with boards across them, unfixed, unsecured, and moveable by the workman as occasion may require." (Stack v. Counsell, 106, "Law Times," p. 342.)

Anything enabling the harassed builder or architect to thread the mazes of this statutory labyrinth is greatly to be praised; and I have no hesitation in recommending this little work. The effect of each report is set out at its head, in language which cannot be misunderstood, and an exhaustive index is not the least valuable of the characteristics of a work intended as a handy book for all interested in the litigation-provoking statute with which it is concerned. A. O. HARNETT.

"Workmen's Compensation Cases," (principally taken from the "Times" Law Reports). Edited by R. M. Minton-Senhouse, of the Inner Temple, Barrister-at-Law, London. W. Clowes and Sons, Limited, 6s.

New Patents.

These patents are open to opposition until February 20th.

1899.—Oil and Paint Cans.—982 C. R. GORRINGE, London, N. The cap of the can has riveted to it on the inside a spring which is bent outwards at each side to engage with stops or projections on the neck of the can. To fix, the cap is given a turn; it is, of course, provided with a washer to ensure a tight joint.

Rainwater Gullies.—2,434. J. DUCKETT and SON, Ltd., and J. DUCKETT; both of Burnley. The gully is made in two parts—a top and a bottom part. The top part is square edged and has two openings, one for the rainwater pipe and the other to receive a grating. On the underside of this upper part there is also a circular lip (about 1in. deep) which fits into a socket in the lower part and enables the trap to be turned in any direction—thus avoiding bends.

Cutting Tiles.—3,460. W. W. MORRIS, Goole. The machine has top and bottom cutting wheels as usual, but both are spring mounted, so that the blows delivered have a percussive and not a crushing effect. It is claimed that the tile can be cut very quickly and cleanly.

Sash Lines.—3,522. C. W. L. FREEMAN and W. C. OLD; both of Birmingham. The sash stiles are grooved to receive the cords, and the knots on the latter fit into circular recesses at the bottom of the grooves. These recesses are covered by metal plates, let in flush, which have inwardly projecting lugs that form a shoulder for the knot to bear against.

Gas Lamp Lighting.—14,948. E. J. SHAW, Walsall. By an arrangement of the gas passages in the plug of the cock, it is possible to have all the burners alight in, say, a three-light lamp, to have the centre burner alight only, or the two outer ones, or to feed only the by-passes. Another part of the invention deals with the prevention of dust entering the lamp globe. This is achieved by providing a glass ball, which will roll and cover the hole in the bottom of the globe after the gas has been lighted.

Joiners' Clamps.—21,401. G. SCHMIDT, Germany. One form of this invention consists of two arms (somewhat like those of a callipers), having movable cheeks at one end and being pivoted to a cross head at the other. Through this latter passes a screw fitted with a crank and handle, and having at the other end a movable cheek. The motion of the arms towards each other is regulated by a screw passing through studs on their face. With this appliance pieces of wood, &c., at different angles can be pressed and held together after being glued or otherwise treated.

Ceilings and Walls.—22,884. F. KEMNITZ, Berlin. Between the girders or walls steel or iron ropes are interlaced, twisted and stretched tight by clamps; their ends may be fastened in various ways, by clamps, hooks, &c. Cement is then laid on. It is claimed that the construction is cheap and strong.

The following specifications were published on Saturday last, and are open to opposition until February 27th. A summary of the more impor-

tant of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—20,025, Durrant, gulleys, traps, &c. 27,567, Pearson, granite, stone and marble sawing machinery.

1899.—631, Duncan, incandescence burners and mantle supports. 682, Seiffert and Tomlinson, apparatus for the production and supply of acetylene gas. 1059, Pruce, means for opening, closing and fixing fanlights, windows, shutters, ventilators, doors, &c. 1066, Miller, smoke consuming fire bridges for boilers. 1254, Mills, Windguards for chimney tops. 1558, Kennedy, brick presses. 2759, Watson and Stevenson, apparatus for gaining access to the exterior and windows of and escape from buildings. 3240, Malkin, Binns and Foster, guards for circular saws. 3753, Saladin, door fasteners and burglar alarms. 3770, Haddan (*Schuppmann*), boilers for warm water or low pressure steam heating purposes. 3859, Moore, manufacture of a substitute for china stone for use in the production of china ware, porcelain, earthenware, stoneware, tiles, bricks, &c. 4115, Caldicott, acetylene gas generators. 4365, Wigham, burning acetylene gas. 5944, Rothkegel, door hinge, 7428, Summers, mortise chisel. 8364, Johnson, axle and sash pulleys. 15,098, Johnson and Hinchliffe, seats of water closets. 16,123, Head and Nielson, method of and means for automatically locking sliding windows at different heights. 20,592, James McClelen Kline and Samuel A. Wetzel, hydraulic rams. 21,340, Thompson (*Bremer Linoleum-werke-Delmenhorst*), manufacture of material for floor-coverings. 21,341, Thompson (*Brady*), fluid pressure turbines. 22,628, Schmitz, process for manufacturing metal pipes. 22,638, Sheak, filters. 22,719, Brown, street sweepers. 22,788, Richter, acetylene gas lamps. 23,032, Johnson (*Compagnie Française de l'acetylène dissous*), acetylene gas burners for use in incandescent lighting.

Mr. George Firth, of New Street, Barnsley, died last week at the age of seventy-eight. He was the oldest master joiner in the town.

Fatal Building Accident at Stoke.—A dreadful accident happened last week at the Stoke Corporation Gas Works. A new retort was in course of construction. A violent gust of wind shook an iron principal, which with six others had been temporarily placed in position to hold the roof. One principal fell against another, and all the seven collapsed, the last of them sweeping down a scaffold upon which some bricklayers were engaged at a height of 70ft. One of these, Peter Plumb, was crushed to death, and five received frightful injuries.

Mr. George Furness, a great engineer and contractor, died last week; he was seventy-nine years of age. Among his achievements were the Thames Embankment from Westminster Bridge to Somerset House, the North London sewerage system, the South-Eastern Railway extension to Port Victoria, and other railways throughout England. He was associated with the late Thomas Brassey (father of Lord Brassey) in railway construction in France, he built the Pernambuco (Brazil) Railway, and carried out extensive draining and dredging works in Russia and Italy.

Temples and Temple Building.—This was the title of Mr. M. Glover's paper before the last meeting of the Architectural Association of Ireland, when the president, Mr. George Sheridan, occupied the chair. Mr. Glover, in the course of his remarks, dealt at the outset with the religious beliefs of the ancient Egyptians, including star worship and sun worship, which were bound up with their system of architecture. With the Egyptians the land of the departed lay somewhere in the North-West. Having explained the Egyptian worship of the sun-god Osiris, and his consort, Isis, and the star worship which preceded it, the lecturer went on to speak of the architecture of the early tombs, which seemed to be the precursors of the Pyramids.

Keystones.

Carlisle Pier, Kingstown, has been improved by being widened and lengthened.

A new Police Station and Court House at Grimsby is to be built. The present building is expected to realise £1,200.

A large Co-operative Store at Newcastle is proposed to be built on the Quayside. It will be seven or eight storeys high and will have a steel frame filled in with cement.

The Deeside Sanitorium is to be begun at once A site, twenty-five acres in extent, has been purchased on Corsee Hill, Banchory. The cost of the building is estimated at £12,000.

Mr. A. Rippin, having severed his connection with The Land Company, has commenced business in conjunction with Mr. Rake at 33, Cheapside, E.C., under the style of The New Century Land Company.

"Hall-i-th'-Wood," Bolton, a fine specimen of fifteenth century architecture, has been purchased by Mr. W. Lever, of Sunlight Soap fame, and presented to the Bolton Corporation. It is understood that it is to be carefully restored.

Dedication Brasses in Norwich Cathedral to the donors to the reparation and organ funds have just been placed on the nave walls. They were designed by Mr. W. R. Weyer, of Bank Street, Norwich, and engraved by Mr. H. B. East.

Tender for new Technical College at Wigan.—For this building the tender of Messrs. Joshua Henshaw and Sons, of Liverpool, amounting to £32,850, has been accepted. A contract for £5,000 for terra-cotta has also been entered into.

Bridge Collapse.—On Wednesday last at High Wycombe, whilst a large traction engine was crossing a bridge spanning the Wye, the structure gave way, and the rear end of the engine fell into the stream. Its removal is expected to be difficult.

The death is announced of Sir Henry Meux.—When Temple Bar was demolished after the building of the Law Courts, he bought the stonework, and had it carefully re-erected on his estate at Theobald's Park, Cheshunt, Hertfordshire, where it now stands.

Scarborough Parish Church has been improved, at a cost of about £1,200. The chancel has been raised and widened, oak desks and seats have been provided, the organ has been removed to the north side, and an iron palisade, a pulpit, and new screens have been erected.

Costly Board Schools for Liverpool.—The Liverpool School Board have decided to accept the tender of Messrs. Holme and Green (£21,633) and that of Mr. William Hall (£32,298) for the erection of schools on the sites in Boaler Street and Birchfield Road, in accordance with adopted plans.

Sutton Board Schools Competition.—From a number of designs submitted in a limited competition for new schools, &c., for the School Board at Sutton-on-Sea, Lincolnshire, those sent in by Messrs. W. Mortimer and Son, of Lincoln, have been selected, and the work will be commenced at once. The scheme comprises schools for 400 boys, girls and infants, together with masters' house.

Theatre for Motherwell.—Plans have been passed for a theatre to be erected in Windmillhill Street, Motherwell. The architect is Mr. Alexander Cullen, F.R.I.B.A., Glasgow, and the cost of the building, which will seat 1,500 persons and will be lighted by electricity, is estimated at about £5,000. The "New Century Theatre" is the name selected.

British Art of To-day.—The chief theme of the first of Professor Herkomer's lectures on painting at the Royal Academy was a condemnation of the fashion in vogue among the younger painters, and a strong advocacy of a revival of the best traditions of the older British school in the place of those modern traditions which our artists have borrowed from abroad.

A School of Art for Hull is proposed to be built. The cost is estimated at about £16,000.

New Branch Library in Leeds.—A new branch public library is to be erected at Stocks Hill, Armley, Leeds. Its estimated cost is £5,000.

The New City Subway, by the Mansion House, which we described in our supplement to the issue for November 29th last, was opened last week.

The Estate of the late Mr. Thomas Huggett, the builder of Cromwell Road, Kensington, W., has been valued at about £81,084.

Mr. Christopher Palliser, J.P., of Northallerton, died on January 14th in his eightieth year. He had a large contracting and building business.

Reid's Brewery, Clerkenwell Road, E.C., is to be swept away. In all, it has realised £26,000. Breweries have, it is believed, existed on the site for nearly 300 years.

Jarrow Municipal Buildings.—It has been decided to appoint an architect to prepare plans and specifications for new municipal buildings at Jarrow, including a county court.

The Hereford and District Master Builders' Association held its annual banquet on Tuesday in last week, when the president (Mr. James Davies) occupied the chair.

For Workmen's Dwellings at Salford, shops, and, a public hall on the site of the Old Infantry Barracks in Regent Road, it is proposed to spend £111,400. A Local Government Board inquiry has been held.

The Liverpool Engineering Society held its annual dinner on Thursday evening last, when Mr. A. Bromley Holmes (the president) occupied the chair. In 1876 the society had fifty-one members; now it has 500.

Forthcoming Exhibition in Leeds.—On Monday next the Twentieth Century Engineering and General Trades Exhibition will be opened in the Exhibition Buildings, Camp Road, Leeds. It will remain open until March 3rd.

Discovery of Mural Decorations.—At the ancient parish church of St. Mary Magdalene, East Ham, some mural decorations have been discovered. They are believed to be eleventh century work, almost synchronous with the building of the church.

Royal College of Art: New Principal.—Mr. Augustus Spencer, headmaster of the municipal school at Leicester, has been appointed to succeed Mr. Walter Crane as Principal of the Royal College of Art, South Kensington, at a salary of £1,000 a year.

Newport (Mon.) Master Builders' Association.—Councillor John Linton and Councillor W. M. Blackburn have been elected president and vice-president of the Newport Master Builders' Association. Mr. W. Jones and Mr. R. Richards are the treasurer and the secretary.

Public Works at Willesden, London, N.W.—The rapidly-growing district of Willesden is about to undertake large public works at a cost of about £128,000. The Guardians will spend £99,000 on the erection of a workhouse, and the District Council £29,000 on the extension of the isolation hospital.

The Church Crafts League is being formed, by those who dissociated themselves from the Clergy and Artists' Association, to bring together clergy and others interested in church decoration and artists and craftsmen who produce this kind of work. The honorary secretary's address is, Leighton House, Holland Park Gardens, Kensington, W.

St. Bartholomew's Close.—At last Thursday's meeting of the Corporation of the City of London it was referred to the Improvement and Finance Committee to consider the best means of opening up and improving the means of communication with the parish of St. Bartholomew the Great and the immediate neighbourhood. Mr. H. C. Morris said it had been found that this improvement would cos £120,000 at least, and the Court last yea decided that it would not be worth the money

Professional Practice.

Birmingham.—The new Board school in Conway Road, Sparkbrook, is now nearing completion. Messrs. Martin and Martin, of Colmore Row, Birmingham, are the architects, and Messrs. W. Whitehead and Sons are the contractors. The façade is plain. Accommodation will be provided for 680 boys and girls and 360 infants. The ventilation is on the most modern and approved principles, the air being washed in the basement before being propelled by the ventilators into the rooms above. In the winter the air will pass over a series of hot pipes, thus being warmed before it is breathed. Fresh supplies of pure air are forced into the rooms every ten minutes. The estimated cost of the school is £14,981.

Cardiff.—New Board schools have been built from designs by Messrs. Habershon, Fawckner and Groves, architects, of Cardiff and Newport, with a frontage to Marlborough Road. There are three separate blocks of buildings, and the schools are the first in Cardiff on the central hall system. The girls' and boys' departments are in the main block; the former contains fourteen classrooms with accommodation for sixty children in each. The boys' department is of similar dimensions. Separate rooms are provided for the headmaster, mistress and teachers, and each department has two entrances with hat and cloakrooms attached. The assembly halls are 90ft. long by 26ft. wide. The infants' department contains eight classrooms with accommodation for sixty children in each—a total of 480—and also separate rooms for teachers. The assembly hall is 49ft. in length by 35ft. in width. As two of the classrooms abutting on the assembly hall are provided with folding doors, this hall can be increased to 60ft. by 49ft. The Slojd department is arranged in a two-storey building, the lower floor being fitted up with benches, &c., for the purpose of instruction in manual trades for some sixty or seventy boys, with separate lockers for tools. The upper floor is fitted up as a laundry and cookery kitchen, accommodating forty and sixty girls respectively, and provided with the latest apparatus. Altogether, the various departments will afford accommodation for over 1,500 children. Lighting is by incandescent gas. Brick has been used in the construction of the buildings, with St. Julian's red brick facing and Bath freestone dressings. The style of architecture is English Renaissance. At the recent exhibition of educational subjects in Cardiff the drawings of these schools were marked off as accepted for the Paris Exhibition. The contractor was Mr. David Davies, of Trade Street, Cardiff, the amount of his contract being £19,666.

Dundee.—A new altar and reredos have been erected in St. Joseph's Church, Dundee. The altar stands on a graded platform of oak parquetry, and is constructed of pure white Caen stone, supported on pillars of Welsh encrinite marble, with richly carved Caen stone bases and capitals. Above the centre of the super-altar is placed the tabernacle, the door being of burnished brass, decorated with *repoussé* work and enriched with groups of large amethysts and carbuncles arranged to form a symmetrical design; and above this door is an alto-relievo panel. On each side a beautifully carved figure of an adoring angel is placed, the figures being sculptured in Caen stone. An oaken staircase leads behind the entablature to the rostrum. The prevailing sculptured decoration on the altar is formed of a series of circumscribed quatre-foils of Gothic character. The apse is lighted by two windows having two lights each, filled in with the figures of the four Evangelists in rich stained glass. The reredos, with its side curtains, fills nearly all the intervening space. It has been designed by Mr. P. P. Pugin, of London, son of the celebrated architect, the late Mr. A. Welby Pugin, and the intention of the designer has been to soften the rigidity of severely Gothic forms by introducing some of the less severe lines of Byzantine architecture. Thus the canopy which projects over the altar is constructed with the usual angular ridge-roof, but the cusping in front and the finials are Byzantine in style. The reredos is divided by pilasters into three large panels filled with figures of adoring angels, about half-life-size, painted in oil-colours upon copper. The inner side of the canopy is divided into eight panels, four on each side, and these are filled with single angel figures. All these painted panels are the work of Messrs. Hardman, of Birmingham. Messrs. Boulton and Sons, of Cheltenham, executed all the carving. The scheme of decoration adopted for the reredos and canopy is the gilding of flat surfaces and the colouring of incisions and hollows with bright crimson, so that the general effect is very rich. This portion of the work was executed by Mr. J. J. Pippet, of Solihull, near Birmingham. From each side of the reredos extend flat brass rods with the word "Sanctus" cut through the metal, and from these depend two curtains which give graceful outlines to the whole structure. The total cost of the work was about £1,000.

Exeter.—St. David's New Church, which has been in course of erection for the past two years, on the site of a previous classical building, was consecrated last week. It has been built by Mr. W. Dart, of Crediton, from designs from Mr. W. D. Caröe, M.A., F.S.A., F.R.I.B.A., of London, after a public competition in which the architect suggested a church built entirely of Bath stone, but in deference to the committee's wish this was changed to Devonshire limestone for the outer walls. The narrowness of the site made it advisable to project the main buttresses into the building, and this adds greatly to the cathedral-like interior of the nave. From these buttresses stone arches spring across the whole width of the nave, and are used to carry the roof timbers from arch to arch. The roof is boarded on the inside of the barrel, and stained green; deeply moulded cornices run along the wall plates, the centre spaces of which are filled by carved angels in adoration. Moulded ribs divide the roof into panels, large spaces being left for future decoration. The chancel roof is of the same construction, but with increased carving effect, and a more ornate cornice. The walls are a mass of rich stonework, covered with decorative designs, the sedilia being particularly graceful, with delicately-carved canopies of stone. The oak reredos has in the centre a large panel with the crucified Saviour, carved in oak. This reredos, as well as the stalls, was built in the workshops at Crediton. The chancel stalls are of wainscot oak. The altar space is raised upon steps of Devonshire marble, the altar steps being of the same material, whilst the floors are in mosaic of varied English and foreign veined marble. The organ chamber is built on the south side. Beneath it, and adjacent, are the clergy and choir vestries, access to which is obtained from the south porch. There is a similar porch on the north side, whilst at the west end a feature of the entrance is a stone arched roof and massive oaken doors on ponderous wrought-iron hinges, the frieze rail of the doors carrying boldly-carved inscriptions. These doors are rather uncommon, the hinges being framed up with them. The total cost has been about £16,000.

Perth.—On Sunday week last St. Paul's Parish Church was reopened after having undergone considerable interior alterations. The old church for some time back has been inconveniently seated and greatly in need of repairing, general cleaning and repainting. The whole area of the ground floor and of the gallery has been reseated with conveniently designed and arranged benches, new wind porches with swing doors have been fitted up at the entrances, the staircases to the galleries have been improved, and the walls covered with pitch-pine lining. The pulpit platform has been rearranged, and a new Communion table and minister's chair in carved oak have been placed on the enlarged platform. Elders' benches have been fitted up at each side of the platform, and sundry improvements to the pulpit and book board have been effected. The windows of the church have been renovated, the old wooden sashes being replaced by leaded lights filled with tinted cathedral glass. The walls and ceilings of the church have been redecorated, and the woodwork stained and varnished. The organ has been recleaned. The improvements have been carried out under the personal supervision of Mr. G. Heiton, architect, George Street, Perth. The contractors were:—Joiner, Mr. M'Quibban; painters and glaziers, Messrs. Stalker and Boyd; heating apparatus, Mr. McGregor. The Communion table and chair were supplied, together with the upholstery work, by Messrs. Love and Son. The total cost of the improvements is £1,000.

Swansea.—The Swansea School Board are adding one more to the number of schools in the borough, this time on a site that comprises one acre and has frontages to Upper Major Street and Edward Street. Very special precautionary measures have been taken with the foundation of the building to prevent any subsidence or cracks occurring, owing to the site being undermined by old coal workings; cement concrete of unusual thickness and width, with steel rails and rods embedded in it, being employed at an expenditure of nearly £1,000 beyond the cost of ordinary foundations. The school will be a three-storey building accommodating 1,230 children in three departments, namely, on the ground floor, 430 infants; first floor, 400 girls; and top floor, 400 boys. Each department will have a central hall 78ft. long by 31ft. wide, with six classrooms and a schoolroom grouped round three sides of the hall. A cookery centre, 30ft. by 24ft., will be provided at the east end of the main building. Ample playgrounds, play sheds, and offices will be provided. The cost will be £18,291. Mr. G. E. T. Lawrence, A.R.I.B.A., of Chandos Chambers, 22, Buckingham Street, Adelphi, London, W.C., is the architect, and the contractors are Messrs. J. and F. Weaver, Mr. David Evans acting as clerk of works.

New Companies.

Robert Millar and Sons, Limited.

This company has been registered in Scotland with a capital of £100,000 in £10 shares, to acquire and carry on the existing business of timber merchants. Registered office: Balmain Street, Montrose.

Yates Brothers (Darwen), Limited.

This company was registered on January 2nd by F. Hatton, 150, Strand, W.C., with a capital of £2,000 in £1 shares, to acquire the business of painters, plasterers, decorators and artists' supply merchants carried on at 234, Duckworth Street, Darwen, Lancashire, as Yates Brothers. Registered office: 1, Varley Street, Darwen, Lancashire.

Avon Aberthaw Lime and Portland Cement Company, Limited.

This company was registered on January 5th by A. H. Atkins, Limited, 23, Bouverie Street, E.C., with a capital of £1,000 in £1 shares, to carry on the business of Portland and other cement manufacturers, lime and plaster manufacturers and merchants, &c. The number of directors is to be not less than two nor more than five. The first are Thomas Hambly and Thomas Williams. Qualification, £100.

Watertight Door Company, Limited.

This company was registered on January 5th by A. H. Atkins, Limited, 23, Bouverie Street, E.C., with a capital of £2,500 in £1 shares, to carry on the business of designers and manufacturers of and dealers in watertight and fireproof doors, &c., and the business of electrical, marine, and mechanical engineers. The first directors (to number not less than two nor more than four) are T. E. Topping (chairman), John H. Hind, and William Hind. Qualification, £1.

S. W. Francis and Co., Limited.

This company was registered on December 30th by Ashurst and Co., 17, Throgmorton Avenue, E.C., with a capital of £60,000 in £1 shares, to acquire, as a going concern, the business of manufacturers of and dealers in revolving wood, iron, steel, and other shutters, now carried on at 64, 66, 68, and 70, Gray's Inn Road, under the style or firm of Francis and Co., and to carry on the businesses of manufacturers of and dealers in every description of venetian aud other blinds, spring rollers, &c. S. W. Francis is the governing director, his remuneration being £1,000.

Hudson, Pearson, and Fernie, Limited.

This company was registered on December 29th by Jennings, Son and Allen, 69, Leadenhall Street, E.C., with a capital of £50,000 in £10 shares, of which 4,990 are ordinary shares and ten founders', to adopt and carry into effect an agreement for the acquisition as a going concern of the business of coal merchants, as now and hitherto carried on by J. Hudson and Co., and a similar business carried on by J. H. Pearson and H. Fernie, under the style or firm of Fernie and Co., and generally to carry on the business of coal and coke merchants; and, further, to acquire any mines, mining, water, and other rights; to search for, get, raise, make marketable, sell, and generally deal in and with brick earth, bricks, and other substances; as stock and share dealers, company promoters, &c. The first directors (of whom there shall be not less than three nor more than ten) are C. Hudson, J. H. Pearson and H. Fernie. Qualification, one founders' or 100 ordinary shares. Registered office: 49, Leadenhall Street, E.C.

Wakefield Building Scheme.—A limited company, composed of Bradford gentlemen, with Mr. Ellis Robinson, builder, as chairman, and with a registered capital of £10,000, has been formed to carry out a large building scheme at Wakefield. The St. John's estate, which has an area of 65,000 square yards, has been purchased, and will be laid out for the erection of residences.

"**The Art and Craft of Garden Making**" is the title of a book which Mr. B. T. Batsford will shortly publish, in conjunction with Messrs. Newnes. Mr. T. H. Mawson is the author. The book will be illustrated by a large number of perspective sketches by Mr. C. E. Mallows, and by more than a hundred plans and details, specially drawn or photographed. The size will be quarto and the price 21s. net.

COMING EVENTS.

Wednesday, January 17.

SURVEYORS' INSTITUTION.—Students' Preliminary Examination—First Day.

BIRMINGHAM AND DISTRICT CLERK OF WORKS AND BUILDERS' FOREMAN'S ASSOCIATION.—Mr. H. Price, A.R.I.B.A., on "House Drainage." 8 p.m.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.—Annual Meeting of the members at 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. Algernon Barker, B.A., on "Legal Topics of Interest to Architects and Surveyors." 7.30 p.m.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Meeting at 8 p.m.

Thursday, January 18.

SURVEYORS' INSTITUTION.—Students' Preliminary Examination—Final Day.

SOCIETY OF ARTS.—Meeting of Indian Section.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Arthur Thomson, M.A., M.B., on "The Anatomy of the Human Form: The Upper Limb." 6.15 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

Friday, January 19.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Lewis F. Day, on "Ornamental Design.—III." 11.30 p.m.

ARCHITECTURAL ASSOCIATION.—(Discussion Section.)—Mr. C. B. Bone on "Granite as a Building Material in the Channel Islands." 7 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Visit to the Hydraulic Installation at Somers Town Goods Depôt, and to the Kentish Town Locomotive Sheds, of the Midland Railway, where a new American Goods-Engine will be inspected. 2 p.m.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. John Castell-Evans, F.I.C., on "Mechanical Physics; Laws of Motion, &c." 8 p.m.

Monday, January 22.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Announcement of Council's Award of Prizes and Studentships, 1900. Mr. Basil Champneys on "The John Rylands Memorial Library, Manchester." 8 p.m.

SOCIETY OF ARTS.—(Cantor Lectures).—Mr. Bennett H. Brough on "Metalliferous Deposits."

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. M. Honan on "Doors and Doorways."

VICTORIA AND ALBERT MUSEUM (South Kensington).—Mr. Hugh Stannus, F.R.I.B.A., on "Historic Evolution of Applied Art: XI.—Byzantine, &c., Christian Art." 6 p.m.

GLASGOW INSTITUTE OF ARCHITECTS.—Council meeting at 2 p.m.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Biennial Dinner. 6.30 p.m.

SURVEYORS' INSTITUTION.—Junior Meeting at 7 p.m.

Tuesday, January 23.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Sir C. Cameron on "Sanitation in regard to Tenement Houses."

GLASGOW ARCHITECTURAL ASSOCIATION.—Lecture by Mr. David Jackson.

SOCIETY OF ARTS.—Meeting of Foreign and Colonial Section.

Wednesday, January 24.

SANITARY INSTITUTE.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. John Castell-Evans, F.I.C., on "Natural Forces: Light, Heat, and Electricity." 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Evening.

SOCIETY OF ARTS.—Ordinary Meeting at 8 p.m.

Thursday, January 25.

GLASGOW INSTITUTE OF ARCHITECTS.—General meeting at 2 p.m.

SOCIETY OF ARCHITECTS.—Ordinary meeting at 8 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—Meeting at 8 p.m.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Arthur Thomson, M.A., M.B., on "The Anatomy of the Human Form: The Lower Limb." 6.15 p.m.

Friday, January 26.

ARCHITECTURAL ASSOCIATION.—Mr. W. R. Lethaby on "Cast Iron." 7.30 p.m.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. David Skinner on "Notes on Builders' Lifting Appliances."

INSTITUTION OF MECHANICAL ENGINEERS.—Annual Elections. Mr. William Schönheyder, M.I.M.E., on "Water Meters of the Present Day; with special reference to small flows and waste in dribbles." 8 p.m.

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Lewis F. Day on "Ornamental Design."—IV. 11.30 a.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BLAENTYLERY.—For erecting new mixed school at Blaentylery, Abertillery, Mon., for the Aberystruth School Board. Mr. R. L. Roberts, architect, Victoria Chambers, Abercarn, Mon. Quantities by architect:—

Jno. Linton ...	£2,900 0 9	W. Phillips... ...	£2,580 0 0
Thomas and Co.	2,800 0 0	Gaen Bros.... ...	2,545 18 7
Davies Bros. ...	2,718 1 6	Bagley and Co., Abertillery* ...	2,467 1 3
A. P. Williams ...	2,700 0 0		

* Accepted.

LONDON.—For the erection of laundry buildings, boiler-house, chimney-shaft, &c., at St. Anne's Home, Streatham Hill, for the Guardians of the Poor of St. Pancras. Messrs. Salter, Issott, and Salter, architects, 13, Phœnix-street, St. Pancras. Quantities by Mr. A. R. Henderson, 47, Pall Mall:—

W. H. Lorden	£4,895	W. S. Beaton...	£4,023
Smith and Sons	4,682	Gough and Co.	3,784
B. Nightingale	4,273	W. H. Critcher	3,683
A. Bush	4,095	T. G. Sharpington ...	3,673

GOSPORT.—For additions and alterations to the "Victory" public-house, Forton-road, Gosport. Mr. Harry A. F. Smith, M.S.A., architect, Star-chambers, High-street, Gosport:—

Hy. Jones	£875	C. M. Dash...	£819
C. J. Lear and Son ...	829	R. M. Middelton and Co.*	792
Jno. Croad	825		

* Accepted.

SULLY (Glam.).—For the erection of a residence at Sully, near Cardiff, for Mr. Richard Wain. Messrs. Veall and Sant, architects:—

		Extra for Oak Joinery, &c.
Shepton and Son... ...	£2,458 7 0	£446 6 0
Chubb and Co.	2,424 0 0	366 2 9
Melhuish Bros.	2,290 0 0	400 0 0
Jas. Allan	2,256 6 6	385 17 8
W. T. Morgan	2,210 0 0	330 0 0
Symonds and Co. ...	2,204 13 1	336 5 5
Knox and Wells*... ...	2,047 0 0	300 0 0

*Accepted. [All of Cardiff.]

WALTON-ON-THAMES.—For the erection of residence, Beechwood Estate, Oatlands Park, for Mr. Thomas Proudfoot. Mr. J. M. Wales, architect:—

Ingram and Co.	£2,378	W. Greenfield, Weybridge*	£1,650

*Accepted.

THE PROBLEM SOLVED!

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

The London Non-Flammable Wood Co. Ltd.

who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking Orders for the supply of their

NON-FLAMMABLE WOOD.

The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists of NON-FLAMMABLE WOOD:—

THE COMMERCIAL CABLE BUILDING,
THE QUEEN'S INSURANCE BUILDING,
. . and . .
THE R. G. DUNN BUILDING.

NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large Orders have been given by H.M. Government.

Quotations on receipt of Requirements, Address, &c.

THE LONDON NON-FLAMMABLE WOOD COMPANY Limited,

Regent House, Regent Street, London, W.

VENTILATING CROWDED BUILDINGS.*

By Thomas Glover Lyon, M.A., M.D.

At a moment when the necessity of an ample supply of fresh air in the prevention and cure of disease holds a foremost place in the minds of everyone, no apology is needed for bringing the question of ventilating before an assembly devoted to the advancement of hygienic science and practice. An attempt to embrace the whole question of ventilation is not my intention; I shall limit my remarks to one department of this important subject, which is daily attracting more and more attention, and whose application is still in its infancy. The problem is that of supplying air to rooms where there is such an aggregation of people as to render some method of forced ventilation necessary. Examples of such places are concert rooms, public theatres, churches, dining rooms, saloons of ships, and railway cars.

A glance at the problem involved in the ventilation of a theatre containing, say 1000 people, is not out of place here. It is usually considered that each person at a theatre should be supplied with at least 1000ft. an hour. At the Opera House at Vienna, the figure is 1600. Taking this latter as a standard, for 1000 people a supply of 1,600,000 cubic feet is required an hour, or about 450 cubic feet a second. As 12½ cubic feet of air weighs 1lb., this corresponds to about 50 tons an hour, or 30lb. a second. If the total area of entrance apertures be 20sq. ft., this gives a velocity of about fifteen miles an hour, or 20ft. a second. A consideration of these figures is sufficient to show that a very considerable force is required to move so large a body of air and distribute it.

In a case with which I am acquainted, where 600,000 cubic feet of filtered air an hour is forced through a room, a 4-horse power is used. On the same basis, a theatre seating 1000 people would require about 10-horse power. This estimate is, of course, extremely rough.

Once having admitted the necessity of employing force in ventilation, the use of fans becomes obligatory, such contrivances as heated exhaust flues are less efficient and extremely expensive to work. There is another point which should be considered in this connection—that is the pattern of fan to be employed. It is well known that some fans which work well when the passage of air is free are almost powerless when a resistance is offered—in other words, when they have to act against such pressure of air as always occurs when a powerful system of mechanical ventilation is carried out. There can be no doubt that timidity in insisting upon a proper outlay, and a want of judgment in choosing adequate blowing power has largely depreciated mechanical ventilation in the estimation of the public.

While agreeing with most authorities on the superiority of the plenum over the vacuum system, I would insist on the great value of using both systems together, that is of blowing in air at inlets and exhausting it from outlets. Not only by this means is the air in rooms kept at nearly atmospheric pressure, but the necessity of making the building or rooms air-tight is dispensed with.

It would be well also to point out the fallacy of the idea that warmed air entering a crowded room is better than the air already in it. A moment's thought will show this is impossible. As long as air remains in a room it is heated by the breath and body heat of the occupants, and its temperature must rise above the temperature at which it was introduced. In other words, the occupants of a room constitute a heating apparatus. The next question relating to the introduction of air into a room and its withdrawal is at what points the inlets and outlets should be placed. There is great diversity of opinion regarding this very difficult subject.

In considering this question the following points must be taken into account:—(1) *Inlet Impetus.*—Air entering a room in any direction has a tendency to pass on in the same direction by its own momentum. (2) *Outlet Impetus.*—Air flowing in a room tends to take the channels of least resistance, which are invariably towards the outlets. (3) *Internal Descent.*—Air introduced into a crowded room is heavier than that already there, and tends to fall. (4) *Internal Diffusion.*—Vitiated air tends to diffuse itself evenly throughout a building. This force, however, diminishes if the general air of the room becomes foul, and acts very feebly in a badly ventilated room. Its importance also is less the quicker the flow of air. (5) *Internal Ascent.*—Vitiated air has a tendency to rise. This factor lessens in importance with the thoroughness of the ventilation, for it is counteracted by the increased activity of diffusion, and like the latter, when a very rapid passage of air is necessary, this force will have only a very moderate action.

The problem of ventilating a crowded room is much simplified if we remember that to solve it we must carry pure air *en masse* into near proximity to all persons in the room; diffusion can only be relied upon to distribute the pure air through a small space. This convection of air must be effected by means of "Inlet impulse" and "Outlet impulse." "Internal fall" and "Internal rise" will play only subsidiary parts. No specific rules can be formulated to guide us in the employment of these forces; every case must be met after a study of the special circumstances attending it.

There are three main principles of ventilation, each having its advocates:—(1) Some regard ventilation as a mere dilution of foul air. Most of the more modern systems of ventilation adopt this principle. Pure air is thrown into the room upwards from about the middle of the wall, and this, by its momentum, runs on and strikes the ceiling and opposite wall, and gets pretty well distributed over the room. The air finds an outlet at an opening near the floor in the wall containing the inlet. If now there is a fast current of air through the room the air at the top and bottom is of nearly equal purity, and the system works well; but if the current is slow the air near the floor is the best in the room, and there is a considerable waste in removing it.

(2) According to a second principle, air should be let in at the ceiling and withdrawn at such a velocity from the floor that the exhaled air is drawn out before it has time to vitiate that in the room. This has been adopted in the French Chambers of Deputies, but it has been found that a sufficiently quick withdrawal of air to counterbalance the natural tendency of exhaled air to rise causes intolerable draughts, and the system is never employed in its full efficiency; it is indeed a lamentable failure, and is no doubt a potent factor in producing the frequent "scenes" for which this Chamber has an unenviable reputation.

(3) The third principle is a compromise between the first two. It is maintained that fresh air should be conveyed as directly as possible to each occupant of the room, and that the outlets should be at the places where the air is foulest, that is in general at the highest parts of the room.

I will now mention some points in favour of this last method, and call attention to a new apparatus for applying it.

First of all, it will be noticed that this principle takes advantage of the natural tendency of exhaled air to rise. Secondly, it necessitates a large area of inlets.

This brings us to another point of the greatest importance in the matter of rapid ventilation—the reduction of draughts. I would here draw attention to a point recognised by all practical ventilating engineers, and that is the impossibility of ventilating a crowded room satisfactorily unless the air is warmed before admission. Warming and ventilation are twin sisters and cannot be separated. The introduction of cold air in sufficient quantities to ventilate a crowded room necessarily entails intolerable draughts. Again, it is not generally recognised to what degree enlarging the area of inlet reduces the velocity of air flowing into a chamber. It is well known that if air is sufficiently heated there is scarcely a limit to the velocity of air that can be borne with comfort. But it is undesirable to heat air above a certain temperature. In England the standard temperature of a sick room is 60 degs. Fahr., and in America 70 degs. Fahr., rather less than the latter temperature will be found to be the most comfortable for places of amusement. Different people vary much in the susceptibility to draughts, but with such a temperature a current of air can, by most persons, be comfortably borne up to a velocity of about 2ft. a second. If, now, we have air at this velocity heated to about 65 degs. Fahr., entering evenly through inlets occupying a quarter of one side of a wall, the general current of air through the room will be a quarter this velocity; that is at the rate of half-a-foot a second. This would admit every minute a volume of air equal to the whole capacity of a room 30ft. wide, yet at no part would there be a velocity of more than 2ft. a second. For ordinary purposes a twelfth of this speed would be ample, and the velocity would not at any point exceed 2in. a second, an almost imperceptible movement. Outlets should be arranged upon similar principles. They must be large in area and well distributed about the room, in order to prevent the air flowing directly from the inlets to the outlets without affecting the general air of the room, and when the exits are placed near persons in the room in order to diminish the draught consequent on a rapid outflow of air.

I will now describe a new method of introducing fresh air into a room and conveying it directly to the occupants, and of removing the most vitiated part. This method is the invention of Mr. James Cadett, of Ashtead, and myself. We offer the use of it freely to all charitable institutions, and to all medical men for the treatment of the sick.

First, as regards the distribution of pure air in a room, a conduit is placed just above the floor near the wall, and a tapering longitudinal slot is made in the top of this conduit and baffle plates are placed across the slot. If now air is forced into the end of the conduit at which the slot is widest it will, if the tapering of the slot be properly adjusted flow out of the slot in an even stream up the wall. The reason of this is that as we check the motion of air, its momentum is changed into pressure. But the air rushing along the conduit is most checked at the closed end, and least at the inlet end, hence the pressure is greatest where the slot is narrowest, and there is an even issue of air throughout the length of the slot.

If we place a screen of some perforated material, such as a wire gauze, reaching from ceiling to floor near the wall the sheet of air running between it and the wall will be broken up into a volume of air issuing from the screen and by varying the closeness of the gauze we can vary the amount of air coming out at any part of the screen.

It will be seen that a stream of air running through a narrow conduit has been changed into a volume of air flowing into a room, a thing of one dimension has been changed into one of three dimensions. The conduit and screen can be put in any part of the room, and in practice it will often be convenient to dispense with the screen. In a church for instance, it would often be enough to run conduits with triangular slots along the passages between the seats. The air thus introduced may be warmed, filtered or treated in any desired way. On the outlet side a similar conduit is used, except as the air is freest to enter the conduit near the outlet the slot is made narrowest here. Also in this case baffle plates are unnecessary. If we wish to abstract the air from the room through a screen of perforated material, this screen must be made of closer mesh near the conduit and wider at parts at a distance from it. The outlet apparatus may be put into motion either by forming a plenum in the room or a vacuum in the conduit. In this way, by increasing the area of the inlets and outlets, a very even distribution of air and a very rapid change without causing draughts of any account can be attained.

---

* A paper read before the Annual Congress of the Sanitary Institute, held at Southampton on August 29th, 30th, and 31st, 1899.

Every construction of building will require special adaptation of apparatus, and much ingenuity will be necessary to meet the requirements of each particular case, but the control over inlet and outlet possessed by the method just described should enable a skilful operator to solve the most difficult ventilating problems if only he is willing to devote sufficient care to the task.

The last point I wish to touch upon is that of legislative action. At the present moment owners of theatres, concert rooms, restaurants, &c., are granted licences without any stipulation being made for a proper supply of fresh air. Yet most places of public resort are notoriously in such a condition as regards ventilation that they are active agents in the production of disease, especially of chest affections, including consumption. Keenness of competition appears to paralyse all private efforts to remedy the present state of things, and I believe nothing but the interference of the legislature or the action of the local bodies will meet the exigencies of the case. The long sufferance, and I must add, the indifference of the British public as regards its own interest are serious bars to all attempts to move in the matter, but it seems to me this Institute is eminently fitted to take the first step. I will therefore conclude my paper by proposing that before a license is granted for any building of public resort, it should be definitely ascertained that provision is made to admit a standard quantity of fresh air to each person whom the building is intended to accommodate.

PURIFYING WASTE WATER.

AT the meeting of the Institution of Civil Engineers held on January 9th, Mr. Charles Hawkesley (vice-president), in the chair, two papers were read. The first, on "The Purification of Water after its Use in Manufactories," by Reginald A. Tatton, M. Inst. C.E., dealt with the seriously polluted condition of the rivers in the Mersey and Irwell Watershed, which had for many years been the subject of complaint. Although in some instances works for the treatment of sewage and trade waste had been constructed, the matter had not been taken in hand seriously until the formation of the Mersey and Irwell Joint Rivers Committee in 1891.

Some details were given of the purification of the waste from the manufactories of Messrs R. Clay and Sons, Kelsall and Kemp, and Syddall Bros. Messrs. R. Clay and Sons carried on the process of ordinary bleaching, dying and finishing, and the works for purifying the trade waste consisted of precipitation tanks and filters, sludge tanks, presses, &c. The volume of water at times amounted to 500,000 gallons per day; it was treated with lime and "iron alum" and settled in tanks in which most of the suspended solids were intercepted; from these tanks the water was pumped to a second series of tanks for further precipitation, and the clear liquor was finally passed through cinder filters to the stream.

Messrs. Kelsall and Kemp were woollen manufacturers, dyers, and finishers. The trade waste was of a very polluting character owing to the amount of soap used in the scouring processes and the grease extracted from the wool. The waste, containing the grease, &c., was kept separate from the dye-water in the mill, so that it might be treated by itself. It was pumped into a series of three tanks, in which the solids were precipitated by lime and ferric chloride, the clear liquor passing forward through a second series of tanks and filters into the stream; the sludge was discharged on to filters composed of cocoanut matting, and, after it had dried sufficiently, it was pressed and the oil extracted. The dye-water from the mill, to which was added the clear liquor from the grease tanks when they were being drawn off for cleaning, was settled in a series of tanks and filtered. The volume of water dealt with was 180,000 gallons per day.

Messrs. Syddall Bros. carried on the processes of calico printing, dyeing, and bleaching, and the pollution was caused by alizarine, logwood, and other dyes, soap, starch, &c. The total volume of the trade waste amounted to about 70,000 gallons per day; the water from the various departments was collected to a well, whence it was pumped to the purification works, which consisted of a central settling tank and two precipitation tanks used alternatively, each of the latter holding two and a half days' supply; iron alum was used as precipitant. The sludge was drawn from the settling and precipitation tanks into a well, and was thence pumped to a sludge-drying area. The water from the precipitation tanks was finally filtered through fine ashes.

The method of treating the different polluting matters separately should receive special attention, as being undoubtedly the most economical and efficient. The polluting waters from bleachworks might be treated by precipitation in tanks similar to those of Messrs. Syddall, and, if convenient, it was advisable to separate the final wash-water, to reduce the volume, as that water was usually pure enough to be discharged direct into the stream. The water from the keirs, being highly concentrated, should be collected in a separate tank and discharged gradually into the remainder of the water for treatment. The materials used in paper works varied so much that it was impossible to describe a typical purification plant; if esparto grass or straw were used evaporators should be put down, and the soda ash recovered, the wash-water being precipitated in tanks; precipitation tanks were also required at mills where rags, hemp, etc., were used. The more extended use of wood pulp had materially reduced the pollution. The polluted water from tanneries, fellmongeries, and breweries should, if possible, after preliminary treatment, be admitted into the sewers, but if this was impossible, efficient precipitation tanks, followed by filtration or land treatment, were necessary.

The second paper was on "Experiments on the Purification of Waste Water from Factories," by W. O. E. Meade-King, M.I.C.E. It was hoped that comments would be made on the use of salt water as an addition to certain precipitants for the purpose of causing rapid precipitation. The author was not aware that any such treatment had been previously tried, and it was such a simple expedient that, even if it proved a failure when tried on a large scale, its trial could have no injurious effect either on the works or the pockets of the manufacturers. Rapid filtration was considered an essential point, owing to the probability of there being only a very limited area in which to put down purification works, and the experiment showed that this could be obtained by having three or four mediums (all of the simplest description), with a space of a few inches between each, so that the liquid, instead of being held up in the filter, had practically a free passage. At the same time it was aerated and was acted upon by the mediums sufficiently to turn out an effluent to all appearance clean and pure, and free from smell.

It was announced that sixteen associate members had been transferred to the class of members, namely: Messrs. G. C. Buchanan, H. Brunlees, D. Clerk, G. P. Culverwell, B.A., B. H. Henderson, E. J. Lovegrove, I. S. McKie, T. L. Miller, E. W. Monkhouse, M.A., C. B. Newton, M. F. Roberts, R. J. Scott, R. S. Strachey, J. Thompson, B.E., L. F. White, C. H. Wordingham. It was also reported that sixteen candidates had been admitted as students.

The monthly ballot resulted in the election of five members, namely: F. W. Bidder (Nottingham), J. P. O'Donnell (Westminster), M. W. Parrington (Monkwearmouth), J. B. Porter (Montreal), B. Thornhill (Lumding, Assam); nineteen associate members, and one associate.

ANCIENT TIMBER STRUCTURES.*

By JOHN DAVIES.

MOST, if not all, of the timber-built structures remaining in this country to-day can be classed under three separate heads—churches, dwelling-houses, and barns. I propose now to deal with only two of these three, the first and the last, as I have not had the opportunity to make a personal examination of timber dwelling-houses, and I prefer to deal with what I have seen and examined for myself, as far as possible.

Of timber churches we have several good examples in excellent preservation, in which divine service is regularly held. In early times they were known as "stave kirks," and, taking everything into consideration, this name was a very appropriate one. Legend is responsible for the statement that the first Christian church built in this country was a timber-wattle structure built by St. Joseph of Arimathea at Glastonbury. Several churches were built here before the twelfth-century church, the beautiful ruins of which are in existence to-day; and of these, two of them at least appear to have been timber ones. No doubt all the early Celtic churches were of timber, and the same might be said of the early Saxon churches as well. According to the Venerable Bede, the Church of St. Peter the Apostle at York in 627 was built of timber, and Bishop Finan, of Lindisfarne, in A.D. 652 built a church there; "yet, after the manner of the Scots, he made it not of stone, but of hewn oak, and covered it with reeds." Ingulphus informs us that Croyland Abbey was originally built of logs and planks, and roofed with lead. One of the best existing proofs that the early churches of this country were timber built is that most of the pre-Norman ones bear unmistakable evidence of the influence of timber construction. The tower of Earl's Barton is without a doubt the finest example. When I visited this interesting church a few years ago I was astonished at the faithfulness of the copy; the upright pilasters, horizontal bars, and diagonal strips are nothing else than correct imitations of sills, studs, and heads of a timber partition properly braced. The baluster shafts in the openings are also palpable imitations of wood turned work. Those who wish to pursue this question further may do so by visiting such well-known churches as Sompting, Sussex; Bradford-on-Avon, Wilts; Corhampton and Martyr's Worthy, Hants; and Worth, Sussex.

But to return to the stave kirks, the oldest and one of the best preserved in this country is Grinstead Church, close to Ongar, in Essex, and it is a curious and highly interesting little church with timber walls. It is a most singular relic of the Saxon era, and a unique example of primitive timber construction. This church takes us a long, long way back towards the first churches of wattle-and-daub kind, in which the Christian Ancient Britons worshipped, and towards structures of a similar character that were brought to light about three years ago by the discovery of the lake village close by Glastonbury. It is generally conceded that the church was built in great haste, and during a time of panic, to shelter the remains of St. Edmund during the Danish invasion of 1013.

Its oldest portion is undoubtedly the nave, and this is built of half trunks of oak or chestnut, fitted and fixed into a sill; the top end is similarly fitted into a headpiece, which in its turn supports the principals of the roof. The whole bears a very strong resemblance to palisade work, which our forefathers may have used for defensive purposes. The nave is only 30ft. long and 15ft. wide, and is exceedingly low. Originally, however, it may have been about a foot or so higher than it is to-day, as, when Wyatt restored it about forty years ago, the bottom of the uprights were in a decaying state and he decided to have them cut shorter. Each piece, however, is said to have been replaced in exactly the position it occupied previous to its removal.

---

* A paper read on December 11th last before the Clerks of Works Association of Great Britain.

At present there are two doorways, both on the south side; one leads directly into the older part, and the other into the fifteenth century chancel, which is built of bricks. There is a small western tower, built of timber, with fir weather-boarded covering painted white, which is a veritable nightmare, out of harmony with its entire surroundings and even with itself, detracting from the character of the church, and threatening to have a similar result on the character of any intelligent observer who has any sense of propriety in matters artistic.

Light is introduced into the nave by dormers in the roofs; there are three on each side. None of them are original; still, I have no doubt whatever that the church originally received its light in that way. There may have been a window in the east end as well; but as the sides of the building were very low, it is certain that there never were any windows there, as the pre-Norman churches were lighted from windows placed very high, close to the eaves in fact. No doubt greater security and more freedom were given to the worshippers in those turbulent days by adopting such a method of obtaining light, and, should they ever be called upon to use them as fortresses, there were fewer points of weakness to guard against when the Danes or other enemies made a descent into their country. It is worthy of notice that the Early English church at Ongar, close by, is also partially lighted by dormers in the roofs; this looks very much as if the thirteenth century people saw some distinct advantage in what had been done by the eleventh century folks close by.

Shenfield Church, also in Essex, has some very interesting specimens of timber work left in it; the clustered shafts between the nave and aisles, as well as the arches between the shafts, are all of oak, and the rood screen and roof are of dark oak. The whole interior is carved, and presents a remarkably rich and pleasing appearance, which increases when it is realised that the work is really in timber and not in stone. Another interesting church in the same county that ought not to be missed is Stock Church. The whole of the west front and the steeple is of oak, and at a distance would be mistaken for a stone front of the Decorated Period. The whole is very ingeniously carried out, and is well worth a visit, if only as an object lesson in construction, as all the joints, &c., are exceedingly well arranged and thought out.

Blackmore Church, also in Essex, has a very interesting tower, built in three receding stages. The two upper ones only are of timber, and the lower of these has the staves arranged vertically, as at Grinstead; in the upper one they are placed horizontally. Each storey has a projecting roof and there is a spire. Margaretting Church also ought to be visited on account of the timber work of its tower. Chessington Church, Surrey, is another near London which is very interesting for many reasons to the archæologist and antiquarian; at present, however, it only interests us on account of its oak piers and timber work overhead, which separate the nave from the south aisle. It is very probable that the above churches were once all of wood.

This brief notice of "stave kirks" cannot be completed without reference to some examples in Cheshire. First, there is the twelfth-century church of Lower Peover. This is what we are in the habit of inaccurately describing as "half-timbered work," and is an excellent specimen of its class; it is of that particular type that served as a model to the stone builders of Earl's Barton, and which they so successfully copied in stone. The whole edifice is built on a low dwarf wall, and on this the sill is bedded, uprights being fixed every few feet. Then comes another horizontal rail on which the windows rest. A little above the window heads is another rail, placed midway between the window and the overhanging eaves. Diagonal struts are fixed between each upright and the rail above; and between the windows these struts are repeated and arranged to form lozenge-shaped panels, the intervening spaces between the timbers being filled up with plaster work. The church has a nave and aisles, and the latter extend back to the extreme end of the chancel. With the single exception of the tower, the whole is built of timber. Marton Church was built in the fourteenth century; here the belfry is also of timber and is an interesting example of the ingenious application of timber to form a rigid self-contained structure. Oak shafts separate the nave from the aisles, and oak arches connect the shafts and support the roof timbers overhead.

Taking the inflammable character of these buildings into consideration, it is surprising that so many of them now remain. Some of them connect us with the past—the past before the Conqueror and Harold and Hereward the Wake. There are, however, some types of buildings which antedate the oldest of "stave kirks" by many centuries; types that existed in Britain before the coming of not only the Dane and the Saxon, but of the Roman as well. These no doubt were first built in Britain by our Brythonic ancestors, who must have been excellent craftsmen in wood, judging by the remains recently discovered on the site of the lake village at Glastonbury, and by the interesting book of Keller on the lake dwellings of Switzerland, for these also were built by the same branch of the Aryan family in that great westward emigration towards the land of the setting sun.

In the year 400 B.C., Pytheas, a Greek mathematician, visited this country, and, after returning home, he reported among other things that "the natives collect their sheaves in great barns and thrash out the corn there, because they have so little sunshine there that our open thrashing-places would be of little use in that land of clouds and rain." No doubt this is the very first authentic instance we have of British barns.

With the advent of the Brythonic people in this country, the Iron Age began, although the Goidelic branch of the Aryan family had preceded them; still, it is generally conceded that the latter were not acquainted with the new metal. And yet the Brythons must have used it very sparingly—in their buildings, at any rate; for to this day our old barns are practically held together by trenails. Do not misunderstand me. I am not going to say that any of the barns we are going to deal with are of that age; probably none of them are more than 400 years old, but I do believe, strongly, that they are all constructed on that ancient pattern.

The most important barn left to us now, from the point of view of size, is the "Great Barn" at Harmondsworth, Middlesex. It is 192ft. long, and 38ft. 8in. wide, and the whole structure rests on a low dwarf wall, built of the conglomerate stone of the locality. The whole of the framework and vertical weather boards are of oak or chestnut; it is exceedingly difficult at times to distinguish the one from the other. Internally, it is divided in the usual way into a nave and two aisles, the latter being again subdivided into bays of 16ft. centres each; this gives just twelve bays to each aisle. These bays originally played a very important part in the barns of long ago; and we must travel to the great table-lands of Media, to the very cradle of the Aryon family, to find what will no doubt prove to be the prototypes of these very interesting old buildings. In Viollet le Duc's "Habitations of Man," is an admirable illustration of the Median House and also one of the Mesopotaman House in Mrs. Lineham's book, "The Street of Human Habitations;" these are the very buildings from which grew our barns, and probably through the latter our basilican churches as well.

All these barns are remarkably alike; any difference that does exist is merely a difference of detail. For instance, I have never seen one yet with true roof principals. The rafters in all cases are strutted up from the tie pieces that help to keep the uprights of the nave in position. The Harmondsworth example is also known as the "Gothic Barn," because the braces between the various members of the framework have been selected out of very crooked material, sawn down the middle and put together in couples, so as to form a series of somewhat rude-pointed arches—hence I presume the term "Gothic Barn." There is a very interesting survival of primitive timber construction in the upper end of all the principal uprights of this building, which shows very clearly how these old craftsmen clung to traditional methods of construction. In this and in several other barns the tops of the uprights are from 4in. to 6in. wider one way—*i.e.*, in the direction of the width of the building—than they are at the bottom. In this case they are sawn from about 1ft. 6in. square at the top to about 10in. by 10in. for most of the way down. They look like a huge diminished door stile purposely placed upside down. There is no need whatever for it in any of the cases I know; yet in most instances the whole of the timber has been tediously chopped away with the axe, because most of these old barns were built before the pit-saw was in general use, if in use at all.

And why was all this labour uselessly expended in this way? It seems to me that they were simply victims of precedent, as in earlier times the forked undressed trunk of a tree would do duty in a similar position, and, of course, at the fork the trunk expanded in a perfectly natural way, and in order to imitate this the mediæval carpenter chopped or sawed the tree away as described above. In the "Ancient Laws of Wales" full particulars are given, with a schedule of prices, of the various parts of the Tribal Hall, and also of the houses of the tribesmen. Again, Mr. Gomme, in "The Village Community," instances the case of "Gatacre Hall, in Shropshire, that was in existence up to about eighty or ninety years ago. It was nearly an exact square. At each corner and in the middle of each side and in the centre was an immense oak, hewed nearly square and without branches, set with its head on large stones laid about a foot deep in the ground, and with its roots uppermost, which roots with a few rafters, formed a complete arched roof." Now, in both these instances the uprights supporting the roof expanded considerably at the top, and I have no doubt that the expanded top of the barn uprights in question is a survival of the old types mentioned above.

I have stated that I have never seen a timber barn with true principals, and I doubt if one was ever built, because such a thing never occurred in the types they blindly followed and accepted as examples, right away back to the prototypes in Media. The strong, bold and original man, who breaks away from traditional notions and accepted ideas, never came, with the result that the last built is much the same as the first, so far as we are aware. The bays that the aisles were subdivided into were regarded as units of construction, and the barn would be described as one of so many bays. In Gloucestershire, and, possibly, other parts of England, bays were separately rented. Shakespeare alludes to this custom when he makes Pompey say, "If this law holds good in Vienna ten year I'll rent the fairest house in it after three pence a bay." In referring to Mr. Halliwell's notes in my edition I find that he has altogether failed to grasp the full significance of the passage. For he says: "A bay was a principal division in the architectural arrangement of a building. It seems out of place here, and I half suspect the poet wrote day." But the poet wrote nothing of the kind; he wrote bay, and meant it, as it was quite a common practice in his time. I believe all these barns are the lineal descendants, so to say, of the old tribal homes of the past, and they represent that period in our economic development when the chief and his family lived in the hall (the nave) surrounded by his dependents, with his harvest gathered and housed in the "upper end," and his cattle in the bays of one aisle and the horses in the other; thus was he always in a position to protect his property. Most of the early English romancists, and the Welsh bards as well, make frequent allusions to such a state of things.

Master Painters' Association of Ireland held its annual convention last week at Belfast.

Masters and Men.

Building Crisis in Edinburgh.—We referred last week to a very serious building crisis that has arisen at Edinburgh, resulting in two firms having to suspend payment. One of them, Mr. James Slater, of 172, Easter Road, is probably the largest speculative builder in the city, and his liabilities, it is stated, will probably be not under £100,000. The failures have caused quite a panic throughout the trade. The speculative building trade has been carried to reckless heights in Edinburgh during recent years, builders and others having rushed into building schemes with quite inadequate capital, obtaining advances over every foot of the buildings as they were built. Dwelling-houses were sold on the instalment principle, the builders finding their profits in the difference between the rate of interest paid by the purchasers and the rate at which they, the builders, borrowed the money. The recent high bank rate has, however, wiped out this margin of profit, and the big increase in the price of materials has also helped to cause disastrous results. The serious state of affairs has caused the Edinburgh and Leith Master Builders' Association to unanimously resolve to reduce the wages of the operatives in the various trades at least 1d. per hour, which will mean about 4s. less per week. The reduction of wages affects masons, joiners, brickbuilders and plumbers, but will not come into operation for some time yet, for according to the agreement with the Masters' Association the joiners got three months' notice of any change before the 15th of this month; the masons get two months' notice, from April 6th; the brickbuilders, notice to be given before February 1st, the change to take effect on May 1st; and the plumbers to receive notice by March 1st, to take effect on June 1st. It is hoped that as there is a good deal of building work of a non-speculative character, matters will not turn out so bad as indications point at present.

The Yorkshire Building Trade.—The second annual meeting and dinner of the Yorkshire Federation of Building Trade Employers took place last Thursday. At a business meeting previous to the dinner, Councillor W. Nicholson, of Leeds, was elected president, and Mr. G. H. Walters, of Hull, and Mr. James Longden, of Sheffield, were elected vice-presidents. The alteration of the rules so that the members of the Council shall be elected from the county associations, and not self-appointed as at present, was also approved of by the meeting. Mr. James Townsley, of Hull, who submitted the toast of "The Yorkshire Federation of Building Trades" at the dinner, in alluding to the struggles of the past year, said he did not think there would be any lock-out for some time to come in Hull. It was not that they were afraid of that sort of thing, but the employers had learned many lessons, as had also the workmen. After the struggle was over, they would settle down with a better understanding between capital and labour than had previously existed. They had been brought somewhat nearer to labour right throughout the country, and out of this closer touch a very great deal of good would come. He believed firmly in federation, and quite apart from labour questions, their Federation before the strike commenced was doing good work—as, for example, that of gaining advantageous concessions from the architects. The advantages thus gained had made building life much pleasanter and happier, and builders in turn, he trusted, were striving to do what they could to assist the architects in their professional duties. The president, in response, said the present was a most trying time in the building trade. Since contracts were entered into some time ago there had been an enormous increase in the prices of material. Iron girders had advanced from £6 to £8 15s. per ton, and timber from 50s. to 75s. per load of 50ft., and Swedish, Norwegian, and Russian timber in proportion. This increase in the prices of building material, combined with the extremely high rate of wages which prevailed, would, he was afraid, seriously check the industry in which they were interested. Upon one matter there was unfortunately a difference of opinion: If they did not make good men by way of apprentices, how could they expect the work to be properly done seven or eight years hence? What they, as a Federation, should recommend was that every master was bound in honour to supply as many men as he could for the coming years. Every boy who went to a master must be legally bound, every chance must be given to the boy to turn himself out a skilful workman and worth the standard rate of wages. Any employer who did not do that was not doing justice to the building trade. Then there was the question of the foremen, who were the representatives of the employers. The policy of the trade unions had been to compel foremen to join the men's unions. What chance, therefore, had the employers to carry on their business successfully? The foremen must be freed from any baneful influence, and the Executive hoped shortly to put forward a scheme by which the Federation would be able to give the foremen better conditions than the masters individually could. The toast of "The Architects, Engineers and Surveyors of Yorkshire" was given by Mr. W. R. Thompson (Dewsbury), and acknowledged by Mr. W. S. Braithwaite and Mr. F. Bowman.

Engineering Notes.

Sudbury is proposed to be lighted by electricity. The cost of the undertaking would be £16,300.

Fulwood Workhouse is proposed to be heated and lighted by electricity. The cost is estimated at about £13,472.

For Electric Lighting Extensions at Oldham the Corporation propose to borrow another £36,000. The total capital expenditure to date is £57,109. A Local Government Board inquiry has been held.

Sheffield Electric Lighting.—Of the £100,000 which the Corporation desired to borrow for electric lighting purposes, the Local Government Board has sanctioned £71,120, leaving the remainder for further consideration.

Cost of Artesian Borings.—For providing lifting tackle for the pump rods in the old artesian boring at Gainsborough, the Urban Council has accepted a tender of £1,189. The revised estimate of the consulting engineer, Mr. Percy Griffith, for the new or second boring is, exclusive of boring cost, as follows:—Engine-house and foundations, £2,250; travelling crane, £300; pumping machinery, £5,000; engineer's commission and expenses, £300; legal expenses and contingencies, £550; total, £8,400.

Electric Light and Traction for Wigan.—On January 4th the Mayor of Wigan (Councillor J. T. Gee) laid the foundation stone of the new power station in connection with the electrical undertaking of the Wigan Corporation. The proposals of the Corporation involve the expenditure of £85,000 for the purposes of electric lighting, and £40,000 on two lines of tramways, whilst the probable expenditure in the future will include the working by traction of the whole of the Wigan and district tramways, making a total capital outlay of between £300,000 and £400,000.

London Gas.—The directors of the South Metropolitan Gas Company propose to abolish the existing sliding scale based on the price charged for gas, and to substitute a new one which will form three divisions in the price, as follows:—(1) For gas supplied with a power of 16 or more candles, 3s. 3d. per 1,000 cubic feet; (2) for gas with a power of 15 and under 16 candles, 3s. 2d. per 1,000 cubic feet; (3) for gas with a power of 14 and under 15 candles, 3s. 1d. per 1,000 cubic feet. The price which will be actually charged to the consumer, as regulated by the illuminating power, will "be the average of all the official testings made during each half-year."

Ball's Bridge, Dublin.—A correspondent to the "Irish Times" says that about fifteen months ago the Commissioners advertised for plans for widening Ball's Bridge. A premium was awarded, but the lowest tender is more than double the engineers' estimate. The matter is now at a deadlock between the tramway company and the Commissioners. "As a professional man," continues the correspondent, "I have no hesitation in saying that any form of cantilever or bracketed footpaths which would give from 10ft. to 12ft. in the clear outside the existing bridge, allowing the full width between the present parapets for road traffic, would be the most inexpensive and, at the same time, most practical method to adopt."

Surveying and Sanitary Notes.

Harwich Sea Wall Defence.—The tender of Messrs. Smith and Son, of Witham, amounting to £1,250, has been accepted for making up Stair Street, Harwich, in order to form a sea-wall defence.

Sanitary Institute.—On January 19th the first of the series of lectures and demonstrations for sanitary officers (29th course) will take place at the Parkes Museum, Margaret Street, Regent Street, W. Full particulars may be obtained from the secretary at the above address.

Contracts for the Morecambe Sewerage Scheme have been let, the first section going to Messrs. J. Schofield, Sons and Co., Leeds, for £66,500, and the second section to Mr. Enoch Tempest for £9,356 11s. 4d. The engineers are Messrs. Beesley, Son and Nichols, of Westminster, S.W.

Institute of Sanitary Engineers.—At a meeting of the Election Committee held on January 10th, Mr. J. Preece James, of Tenby, was elected a fellow; Mr. K. D. Subramani Aiyar, of Madras, was elected as member; and Mr. R. W. Watts, of London, and Mr. J. Lennard, of Brentford, were elected associates.

"Streets" with Significant Names.—To accommodate the large number of prisoners in Pretoria, three vast sheds, two miles long, resembling streets, have been constructed to the north of the town. They are the work of a Belgian architect, and are called respectively Ladysmith Street, Kimberley Street, and Mafeking Street.

Sweeping away the Old.—The City Corporation propose to form two new streets on their "John Carpenter" estate adjoining Tottenham Court Road. One would cut through North Crescent and come out opposite Tottenham Street, and the other through South Crescent and come out opposite Windmill Street, thus practically abolishing the two old-fashioned crescents, and continuing Alfred Place at each end, by an angular bend, into Tottenham Court Road. The neighbourhood is old, and the Corporation property can be distinguished by the City arms on the fronts of the houses, which were built between 1790 and 1814.

Bristol Main Drainage Scheme.—In reference to the scheme for taking the sewage out of the river Avon at Bristol, upon which a poll of the city is to be taken (as reported in last week's issue), it is stated that the proposed expenditure will amount to a rate of from 4d. to 6d. in the £ for forty-five years, in addition to which there will be required about £2,500 a year for pumping and a considerable sum for machinery renewals. The proposed sewer would pass under Shirehampton by tunnel and then cross the flat land to Avonmouth (the sewer being 10ft. above the level of the land on each side) to a point near Avonmouth Hotel. At a short distance from this hotel it is proposed to erect a tank, covering eight acres, into which the sewage of perhaps a population of 500,000 persons would accumulate for hours at every tide.

COMPLETE LIST OF CONTRACTS OPEN.

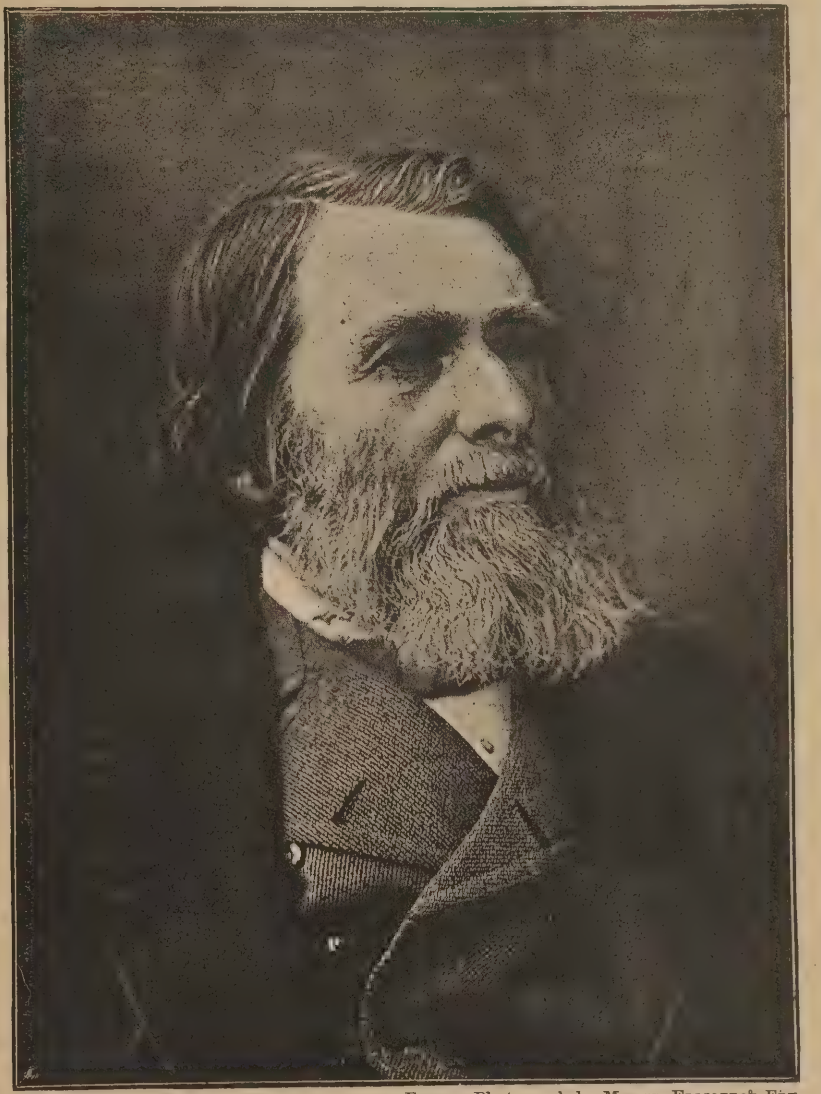
John Ruskin. THERE are few who will not feel that with the death of John Ruskin there passes from the stage of our English life one of the very few to whom the title of "great" indisputably belongs. Some will think of him primarily as the great art critic who swept aside the technicalities and pedantries by which lesser critics had been bound, and helped us to see, as he saw, the essential qualities of a work of art; to others he is supremely the reformer, the prophet of a new social order; or he is the religious and moral teacher, not the less authoritative because bound by no Church or creed; to the literary man he is first and foremost, the master of an English style of unsurpassed beauty and power. But those of us who are concerned with architecture and building think first of Ruskin as the one great leader and teacher who has devoted genius and enthusiasm to the advancement of our great art and craft. It is not necessary for an architect to accept the teachings of Ruskin in their entirety in order to recognise that whatever he has written on architecture is worthy of the closest attention, and to feel that no other voice has spoken on this subject with an authority equal to his.

The architect owes also a debt of gratitude to Ruskin for what he has done to extend a knowledge and appreciation of architecture. Many thousands of intelligent and fairly educated people, who would never have been attracted to the ordinary architectural textbook, have acquired through the fascinating pages of Ruskin's works a knowledge not of the outward form only, but of the soul and essence of noble architecture. Thanks to his eloquent pen, the works of the old cathedral builders have revealed to thousands a beauty and nobility hitherto unseen and unsuspected. The reading of such a chapter, for instance, as that on the nature of Gothic in "The Stones of Venice" has been to many as the introduction to a new world.

It is the same in regard to pictures; the ordinarily intelligent person who entirely lacks artistic skill and training, may, if he be a student of Ruskin, obtain from the contemplation of pictures an intellectual and moral stimulus and a degree of enjoyment he could never have without such help. So, too, in regard to Nature; many who have for years seen the wonders of Nature, without observing or being impressed by them, have had their eyes opened by Ruskin to the hitherto unsuspected beauties that lie in the commonest objects, and are now able to see that

> Earth's crammed with Heaven,
> And every common bush aflame with God.

It is this power of penetrative insight, combined with that other power—perhaps even more rare—of making others see what he himself sees, which is one secret of Ruskin's greatness and influence. To no man in ancient or modern times does the title of Seer more fitly belong than to him.



From a Photograph by Messrs. ELLIOTT & FRY.

THE LATE JOHN RUSKIN.

That his influence is real and abiding there can be no doubt. A leader writer in a London morning paper declared on Monday that "his influence, like his genius, was intense rather than extensive. To the great mass of his countrymen he will be a great name rather than a great inspiration." This, we think, is an utterly mistaken judgment. It may be doubted whether any Englishman in this century has exercised a wider and more commanding influence. True, the influence was often indirect, but the signs of it may be seen on every hand. There are not many men who have done good work in our time in art, in literature, in politics, in social reform, but will gladly acknowledge the inspiration they have gained from John Ruskin. Nor have there been many modern movements making for the dignifying and beautifying of life in which his has not been a potent—though sometimes unrecognised—influence. He espoused the cause of the Pre-Raphaelites when they were the objects of general obloquy; he was the inspirer of the Arts and Crafts movement and of the modern tendency towards the revival of old handicrafts and the encouragement of simple honest workmanship; he did more than any other man to humanise the science of political economy, and to inculcate those twin doctrines which lie at the root of most of the humanitarian efforts of our time—the dignity of human labour and the value of human life. But his influence does not end with his death; rather, it may be expected to increase. Wherever men love the beautiful and seek the true, the works of John Ruskin will remain a help and an inspiration alike to the humble and the great.

H. B. P.

THE "BUILDERS' JOURNAL" SHILLING FUND

TO PROVIDE HOMES FOR DISABLED AND INVALIDED SOLDIERS.

HOW EVERYONE MAY HELP.

As announced in last week's issue we have started a Shilling Fund to assist as far as possible the admirable project that has been set on foot for building a Home of Rest for discharged soldiers as a gift to the nation from the building trades. The proprietors of the BUILDERS' JOURNAL AND ARCHITECTURAL RECORD will head the list with a donation of one thousand shillings (£50).

Character of the Gift.

The purpose of the gift is to meet as far as possible the needs, which all the patriotic funds hitherto established have to a great extent overlooked, of the permanently disabled soldier discharged from the army with a pension inadequate to supply even the barest necessaries of life. It is proposed to erect and equip six cottage homes containing in all 100 beds, and in selecting inmates for the homes preference will be given to soldiers who have at some time been members of one or other of the building trades.

The homes will be erected on a freehold site at Bisley, generously given by Lord Pirbright. Their management and maintenance will be superintended by a special sub-committee of the Sailors' and Soldiers' Help Society, an excellent institution of which H.M. the Queen is patron.

Some of the Workers.

The administrative work, together with the construction of the homes, will be in the hands of a small executive, comprising Mr. Edwin O. Sachs, acting as chairman, Mr. Fred. R. Farrow, F.R.I.B.A., Mr. F. Hammond, F.R.I.B.A., and Mr. Ellis Marsland (District Surveyor), with Sir John Taylor, K.C.B. (H.M. Office of Works), Mr. Thos. Blashill, F.R.I.B.A. (late Architect of the L.C.C.), and Mr. Arthur Cates, vice-president R.I.B.A. (late Crown Surveyor), as advisers. Mr. J. Randall (President of the Institute of Builders), Mr. Thomas Gregory (President of the London Master Builders' Association), Mr. H. H. Bartlett (of Messrs. Perry and Co.), Mr. Stanley G. Bird, Mr. M. Byng (of the General Electric Company), Mr. F. J. Dove, Mr. Henry Holloway, Mr. Frank May (of Messrs. Holland and Hannen), Mr. George Haward Trollope (of Messrs. George Trollope and Sons), Mr. A. Wragg (of Messrs. Eastwood and Co.), Mr. J. Howard Colls, Mr. George Jennings, and Mr. Sam Waring are among the body of stewards representing the donors.

Methods of Helping.

The Executive of the Building Trades Gift, whose address is 1, Waterloo Place, Pall Mall, S.W., invite offers of gifts in kind; they have issued printed details, giving the exact quantities of materials, fittings, &c., required, and those of our readers who wish to help in this way should write for these particulars.

Obviously, however, there are many thousands connected with the building trades whose gifts could not possibly take that form, and in the hope of enlisting the help of many who would otherwise be left out, we have started a Shilling Fund.

By this means all who are in any way connected with the building trades—architects, architects' assistants, draughtsmen, students, builders, clerks of works, foremen, workmen and apprentices—will be afforded an opportunity of taking their share in the national gift.

Many of our readers have no doubt already contributed to one or other of the funds that have been organised for the benefit of our soldiers or their families, but we venture to hope that, if only by sending us a shilling postal order, they will take some share in this special and distinctive gift, and thus help to make it thoroughly representative of the building industries of this country.

In response to our appeal a number of contributions have already been sent in, among them one of two hundred shillings, from Mr. H. L. Florence, F.R.I.B.A. We shall publish next week the first list of subscriptions received.

The Executive and the "B.J." Fund.

The following letter addressed to the Editor and proprietors of the BUILDERS' JOURNAL shows that our action in regard to this fund is heartily appreciated by the Executive of the General Fund :—

"DEAR SIRS,

"We have just seen your letter of 16th inst. and a copy of your journal of the 17th inst., and we wish to take the immediate opportunity of this meeting to express to you our great appreciation of your generous offer to open a special Shilling Fund, which you have headed with the splendid gift of a thousand shillings.

"The effort to get in touch with the many to whom a contribution in kind or the sending of a cheque would be inappropriate is one that deserves particular attention, and we desire to thank you for having so courteously undertaken to help in this direction.

"Regarding the allocation of the monies collected by your fund, we think it might be well to postpone any decision until a few weeks hence, but it would be our wish, if it meets with your views, that the monies collected should be utilised for one distinct object in the scheme, so that the individuality of your contribution may be retained.

"Again thanking you for your courteous and generous assistance,

"We are, Dear Sirs,
"Yours very truly,
"On behalf of the Executive at their meeting,
"EDWIN O. SACHS,
"Chairman of Executive.
"THO. F. RIDER,
"Honorary Secretary."

With regard to the suggestion in the above letter about allocating to a special purpose the monies collected through our Shilling Fund we shall have something to say in a future issue; but obviously much depends upon the extent to which our readers respond to our appeal. This is an effort in which all may share.

How Architects May Help.

Let this week's BUILDERS' JOURNAL lie in your office where it is likely to be seen by chance callers. Allow the leaflet enclosed in this week's issue to be passed round amongst your assistants so that they may add their contributions to your own. Remember that this gift represents all who are concerned in any way in the work of building. The builders and builders' merchants are giving material; but a large sum of money will necessarily be required, and it is natural that we should look to the architectural profession to supply it.

How Builders and Merchants May Help.

Find out from the executive committee what building materials are required, and let them know what you can offer. Or, if you will let us know what you are prepared to give, we will communicate with the executive. But if it is more convenient to give cash, fill up the form enclosed in this number of the BUILDERS' JOURNAL and return it to us with your cheque or postal order. Circulate several copies of this week's BUILDERS' JOURNAL in your workshops, or pin up our leaflet in a conspicuous place, so that your workmen may have their attention drawn to our scheme.

How Students may Help.

Ask your fellow students whether they have subscribed to the B. J. Shilling Fund. If they have not, offer them our leaflet and a nicely sharpened lead pencil. Discuss the matter at your classes and discussion meetings. Remember that this is an effort not merely to relieve a temporary necessity, but to provide a gift of permanent value to the nation. When you have risen to the top of the architectural profession it will a satisfaction to you to remember that in your student days you had a hand in this beneficent work.

How Workmen may Help.

Talk about the Fund to your mates. Ask them if they do not think it a practical, sensible scheme. Get the form inclosed with this issue filled up and returned, and if you can fill up further slips they will be gladly sent; individual contributions need not amount to a shilling, smaller sums will not be despised. If you get twenty men to give sixpence each you will do a better stroke of work than if you sent five shillings as your personal contribution. If you are a trade unionist, mention the fund at the next meeting of your branch.

How All May Help.

Talk about the Building Trades Gift and the BUILDERS' JOURNAL Shilling Fund; do not, however, confine your efforts to talking, but pay—pay—pay! And remember the ancient motto: *Bis dat qui cito dat,* which is, being interpreted, "a shilling sent to the B.J. fund this week is better than two shillings sent a year hence."

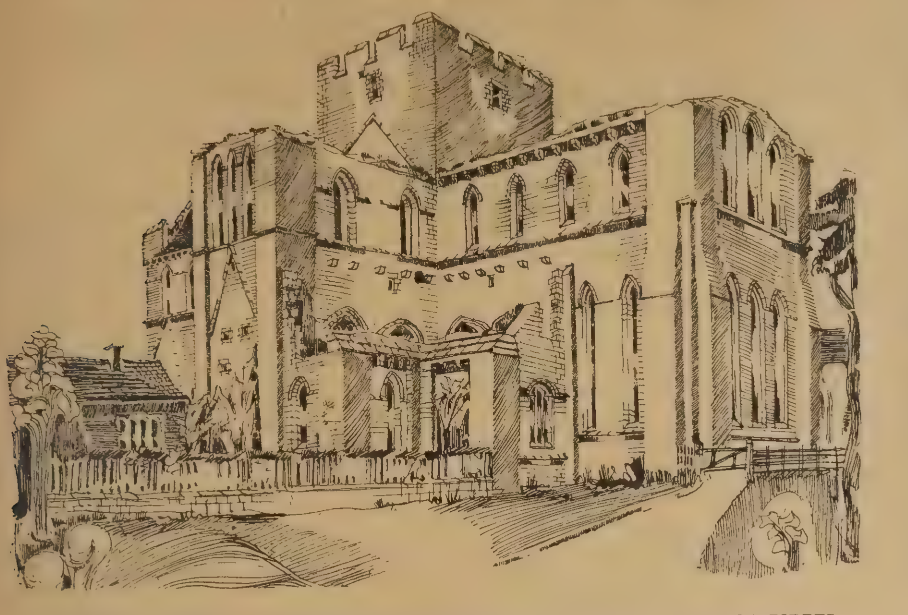
How Others are Helping.

The Executive of the Gift have received a number of valuable donations in the form of building materials. Among the more important may be mentioned the following who have contributed to the entire set of six homes, irrespective of the quantity of materials that may be required :—

Messrs. Nicholls and Clarke, the whole of the glazing; Messrs. Webbs' Engineering Company (Birmingham), the entire door fittings and window furniture, and the general ironmongery and taps; Messrs. G. A. Williams and Son, the whole of the interior blinds; Messrs. Diespeker and Co., the mosaic hall flooring. Messrs. Roberts, Adlard and Co. have offered to lay the entire slates. Messrs. Hobbs and Hart, the whole of the locks; Velongo Slate and Marble Quarries, the whole of the damp course slating and other heavy slate work; S. and E. Collier (Reading), the whole of the ridge tiles.

Numerous other gifts for individual sections of the scheme have been made, among these being :—

The Columbian Fireproofing Company, the first floor flooring of one house; Messrs. G. Aston and Sons, 50cwt. of ironwork and some large girders; Messrs. Strode and Co., the electric fittings for one house; Messrs. John Burton and Co., rafters and ceiling joists for a pair of Homes; Messrs. Lindsey, Neal and Co., the heavy girders for a pair of Homes.



LANERCOST PRIORY: VIEW FROM THE SOUTH EAST. SKETCHED BY EDWIN FORBES.

A RUN ROUND CARLISLE.

By EDWIN FORBES.

A WANDERING architect like Autolycus must be a gatherer of smaller things than cathedrals, and in a trip round Carlisle he will bring back a fund of ideas for every-day work. One could hardly come across a more interesting part of the country where the average of old work is so good.

Wetherall, an ideal village some five miles from Carlisle, is very complete with its village green and cross, while its cottages are thatched and, for the most part, pleasingly covered by greenery. The village church has a splendid south elevation, the other parts having been spoilt by restoration. This church is at the side of the Eden, the banks of which are well wooded, while the surrounding scenery is of the most charming description.

A little to the south of the village are the remains of the priory. The tower stands alone with bold embattled cope and square-headed deeply-recessed windows of the fifteenth century. The village of Corby lies across the Eden and may be reached by a ferry or "toll bridge," the view from which is very fine.

This village, with its lovely setting and its old-world air, has a castle which was restored in the last century; it is quite Adams in character. The caves of St. Constantine in the castle grounds on the banks of the river are cut out of red sandstone and are very primitive.

The snug village of Brampton also lies within range of Carlisle. It presents the appearance of a quiet agricultural town, little likely to change its ancient character to meet the claims of modern business, that are elsewhere conceded. Near the market hall are the old "stocks;" some good sketches may be made round about the market cross.

About two miles east of Brampton, by the banks of the Irthing, stands the Priory of St. Mary, Lanercost. Little is known of the early history of this venerable pile, beyond that it was founded by Robert de Vaux, Lord of Gilsland, about 1166, and became the home of a colony of Augustine monks from Hexham. The west front of the church is exceedingly fine, and of the purest and simplest Early English. Above the doorway is an arcade, with cleverly carved caps, over which are three long lancet windows. The nave of the church has been restored with great taste and is used as a parish church; the choir, transepts and tower are roofless.

The magnificent tomb of Thomas, Lord Dacre, exquisite in design and covered with the arms of the various baronies, is a study for lovers of heraldry.

The monastic buildings are very complete with the exception of the chapter house and dormitory, which have been demolished. The banqueting hall has five-light mullioned windows, an open fireplace and an original timber roof; and the abbot's house, although roofless, is otherwise very complete. The vicarage is one of the most pleasing "bits" to be met with, so perfect is it in proportion; it is a good example of English Renaissance. Abutting it is an old tower, containing the room in which Edward the First slept during his visit to Lanercost.

Across the Irthing, on a hill, stands Naworth Castle. The quadrangle is especially interesting with its long mullioned windows and its open staircase. The great hall occupies the north side and is approached by a broad open staircase. By the dismantling and destruction of Kirk Oswald, Lord William Howard acquired for his own castle the oak ceiling and wainscot work of that ancient hall and chapel, which he used at Naworth.

On the way from Naworth to Gilsland lies the famous Roman camp. The road is on the top of the old wall for several miles, and the camp is of great interest to the antiquarian and the architect. Equi-distant from Carlisle and Penrith is Armathwaite Castle. It presents no appearance of a fortified residence, but is pleasantly situated in beautifully wooded grounds. Architecturally speaking, it is only for the sketch book.

Three miles further on is a nunnery, a house of the Benedictine nuns, but this unfortunately has been almost entirely demolished. The grounds, however, are still as in the "days of yore." The old pigeon house, the stone summer houses, covered with cinquefoils and heraldic devices, are all most interesting. Near the remains of the nunnery is a Roman altar and an old cross, said to mark the boundary of the ground to which malefactors could flee, and upon which is inscribed

WETHERALL CHURCH SIDE DOOR TO CHOIR
EDWIN FORBES
HEARE LYIS

SIDE DOOR TO CHOIR, WETHERALL CHURCH. SKETCHED BY EDWIN FORBES.

LANERCOST VICARAGE. SKETCHED BY EDWIN FORBES.

"Sanctuarum 1088." A few miles through very hilly country brings one to Kirk Oswald, a long, straggling, crooked street lying on a steep hill. Almost every second house is old-fashioned, and each has a quaint old sign-board; in most of these houses there is some very good panelling. At this point we join the main road to Carlisle, feeling that this run round its precincts has not been time wasted.

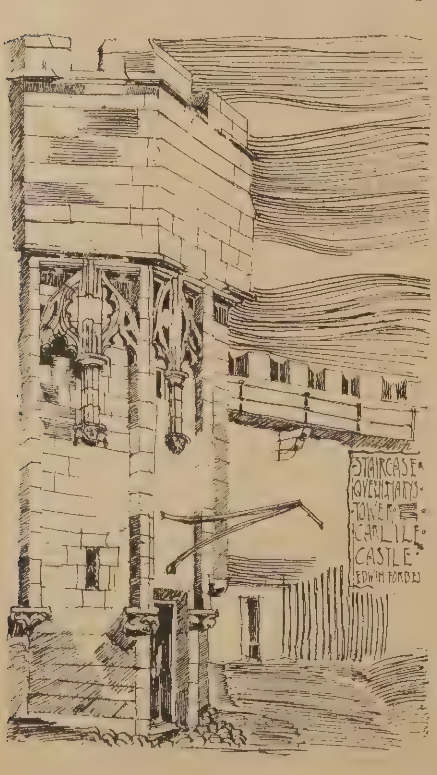
MODEL ANSWERS TO EXAMINATION QUESTIONS.

Being Answers to Questions set at the Final Examination held by the Royal Institute of British Architects in June, 1899.

By G. A. T. MIDDLETON and R. W. CARDEN, Associates R.I.B.A.

X.—SPECIFICATIONS AND ESTIMATING.

1. *Write a specification of the carpenter's and smith's work to a staging 50ft. long and 20ft. broad, with an average height of 10ft., at the side of a road to view a public procession.* (There would, of course, be ample drawings to a large scale supplied in actual work, but here no drawings are asked for, and none therefore given.)



STAIRCASE, QUEEN MARY'S TOWER, CARLISLE CASTLE. SKETCHED BY EDWIN FORBES.

The timber used throughout the staging to be best, well-seasoned Baltic fir, die square, and free from shakes, large knots, and all other defects. (It is assumed that the ground upon which the staging is erected is paved in some manner, or is sufficiently compact to render any boarding or other foundation for the bearers unnecessary.)

The sill beams are to be 10in. by 10in. and 50ft. long, placed 10ft. (centre to centre) apart and connected at four points in their length by 6in. by 4in. cross pieces bolted down to the sills. The verticals are to be 8in. by 8in. and of the heights shown on the drawings, secured to the sill with dog-irons, and strutted apart at their feet with 4in. by 6in. straining pieces. The heads (this could only be expressed by a drawing) are to be 8in. by 8in. resting on cleats, and supported at two points in each span by raking struts and straining pieces of 5in. by 5in. stuff secured together with dog-irons as shown. The verticals at the back, front, and sides of the staging are to rise 3ft. above the level of the part of the flooring adjacent, so as to form a balustrade, and all verticals are to be braced with a 5in. by 8in. diagonal, secured with dog-irons between each two verticals throughout the structure. The carriages to be 6in. by 8in., with rough spandrels out of 2in. stuff to carry the boarding. The railing round the stand is to consist of two 6in. by 5in. rails, tenoned into the uprights, one at the top of the posts and the other at half its height from the floor. The stairways at the sides and centre of the stand are to have one intermediate step, with 1½in. treads and riser, glued and blocked, and secured to floor between each two tiers of seats. Upon completion, the work is to be tested as thoroughly as possible in the presence of the architect, when special attention will be paid to the strength and size of the exits, stairways, &c., in case of a panic.

2. *Write a specification of the excavator's, bricklayer's, and tiler's work for a swimming bath, below the dressing-room floor level, 80ft. long and 30ft. wide.*

EXCAVATOR.—Remove vegetable soil to level of bottom of layer of hard brick rubbish, and wheel and deposit it.

Remove superfluous surface soil, and re-use for filling where required to make up finished levels. Excavate trenches for outer walls of dressing-rooms to the depths shown (on drawings which in actual work would be supplied), 3ft. wide, the bottom to be rammed and levelled. The depths shown on the drawings are believed to be sufficient, but should a firm bottom not be reached the contractor is to call the architect's attention to the fact before proceeding. The trenches are to be filled in as soon as walls are above ground level. Excavate for the tank of the bath to the bottom of the level indicated on the section for the layer of dry brick rubbish, and (but this may not be necessary, depending upon situation, whether in wet soil, &c.) provide and maintain shoring, sheeting, planking, and strutting, also pumping and baling, as required, and remove plant when no longer necessary. The bottom is to be thoroughly well punned and consolidated. All filling-in is to be well punned in layers and watered when so directed. All superfluous earth is to be removed and carted off the site.

Brick rubbish.—Lay over the bottom of the tank a layer of broken brick rubbish 12in. thick, well rammed and consolidated, and under the floors of the dressing rooms, as shown on section, a similar layer, but 6in. thick.

Concrete.—The concrete for foundations and the bottom of the tank to consist of fresh burnt blue lias lime and ballast of clean, sharp pit or river gravel, to pass a 2in. mesh, and clean sharp sand, mixed on a boarded platform in the proportion of one of lime to five parts ballast and two parts sand, the whole to be thoroughly incorporated and sprinkled with sufficient water, its consistency to be such that it will support the weight of a man at the time it is shovelled into position. The concrete bottom of tank is to be 2ft. thick.

Asphalt. — Lay over the whole width, from the outer side of the external walls to the kerb of the bath tank, a ½in. layer of Val de Travers asphalt, to be laid by the company's own workmen and finished where exposed with a smooth surface. Lay a similar layer over the bottom of the bath tank and also a vertical layer upon the inner faces of the brick walls, to be hereinafter described, composing the sides of the tank. The asphalt to the sides and bottom of tank to be prepared for tiles.

BRICKLAYER. — *Bricks.* — The bricks for footings in the external walls of the dressing rooms to be approved hard, sound, well-burnt whole stocks, bats to be used only where necessary for bond. The bricks used in the walls of the tank are to be blue Staffordshires, of best quality, true in shape, well burnt and giving a metallic ring when two are knocked together.

LANERCOST PRIORY: THE VICARAOE. SKETCHED BY EDWIN FORBES.

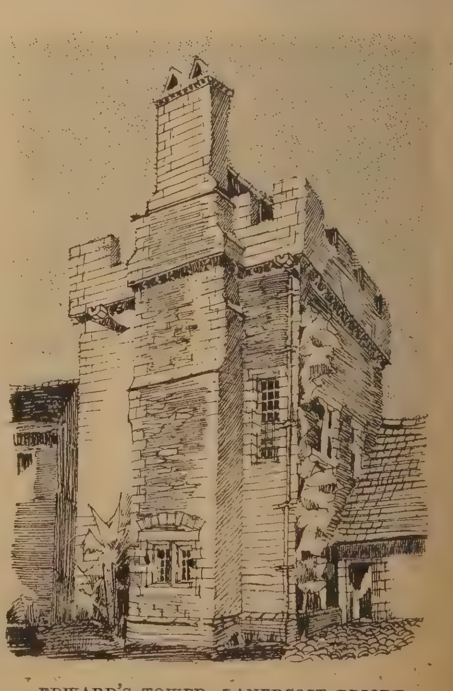
Lime.—The lime to be fresh burnt blue lias lime of approved quality.

Sand.—The sand is to be clean, sharp river sand (if in London, from above bridge) of medium coarseness and approved quality.

Cement.—The cement to be Portland cement from an approved maker, to weigh not less than 112lbs. per striked bushel and ground sufficiently fine to pass 90 per cent. through a sieve of 2,500 meshes per square inch.

Mortar.—The lime mortar to be composed of one part of lime to two parts of sand, well mixed by hand in quantities sufficient only for one day's consumption. The cement mortar to be mixed in quantities as required for each day in the proportion of one part of Portland cement to two parts sand.

Brickwork.—The walls of the tank are to be built exactly to detailed drawings to be



EDWARD'S TOWER, LANERCOST PRIORY. SKETCHED BY EDWIN FORBES.

supplied. To be of blue Staffordshire bricks in English bond set in cement, 3ft. thick at base at the deep end and diminishing by external offsets of 2¼in. every five courses to 1ft. 6in. at the top. The wall at the shallow end to be 18in. thick at top and stepped internally with eight brick steps of 1ft. 2in. treads and 6in. risers, the nosings to be quarter-round moulded bricks. The side walls are to be of the same depth and thicknesses for the length of 16ft. adjacent to the deep end as the deep end wall. The length of 16ft. adjacent to the shallow end wall is to be similar to the corresponding upper part of the deep end wall, and the space between the two parts specified is to vary in depth per each length of 16ft. approximately with the sloping surface of the tank floor (all this again renders drawing absolutely indispensable). Lay rows of tarred and sanded hoop-iron bond, No. 15 gauge, 1½in. wide, at about every four courses throughout the height of the walling, well connected at the angles. The asphalt paving in front of the dressing boxes is to stop against the top course of the tank walls. This top course is to be brick on edge with a quarter-round moulded brick to the nosing.

TILER.—The floor of the tank is to be paved with 9in. buff-coloured tiles of approved make. The walls of the two sides and end to be tiled with 6in. white glazed tiles of approved manufacture.

3. *Write the specification of the ironfounder's, carpenter's, and glazier's work, for a covered bridge above the ground-floor storey* (sic.), *between two buildings at the distance of 20ft. apart.*

IRONFOUNDER.—*Joists, &c.*—Provide and fix two steel joists 15¾in. by 6⅛in. and weighing not less than 62lbs. per foot run, and having 12in. bearing at each end upon hard York stone templets 18in. by 12in. by 6in. deep. The uprights shown upon the detail drawings to be of the following sections:—angle irons 3in. by 3in. and T-irons 3in. by 4in., secured by angle cleats and rivets to the upper flange of the rolled steel joists. The top-rail T-iron to be 5in. by 3in., secured by angle cleats, as before described, to the uprights and securely built into the wall at both ends. The 4in. by 3in. rolled steel joists in the floor to be placed 4ft. apart (the intervening spaces to be filled with coke breeze concrete 4in. thick and described under excavator) and to rest upon and be rivetted to a 3in. by 3in. angle iron, rivetted to the web of the rolled steel bearing joists.

Rainwater Gutter.—Provide and fix a 3in. ogee cast-iron rainwater gutter with 3in. cast-iron downpipe where shown on the section, the gutter to be firmly screwed to the fascia board. All ironwork to be properly painted with red lead paint before being fixed.

CARPENTER.—The joists of the flat roof are to be of the best Baltic fir, die square, free from sapwood, shakes, and all other defects, to be 6in. by 2in. at the highest point, and to fall 1in. towards the gutter. They are to be 14in. centre to centre, and to be properly secured to the T-iron top-rail. The boarding to this flat to be 1in. rough boarding.

GLAZIER.—The fixed lights and the fan lights above them to be glazed with coloured rolled cathedral glass with narrow cames, and to be bedded into the frames with white lead.

4. *Write the specification of the mason's work of a stone portico for carriages to a mansion or public building.*

Generally.—The whole of the stone to be Portland stone from the Whitbed stratum, free from sand holes, vents, and all other defects; to be worked so as to be on its natural bed in the actual work, and to be put together with fine joints in putty, and cleaned down and left perfect at completion. All stone injured by frost, negligence, or any other cause is to be taken out and replaced. All stones to hold their full scantlings, and to be cut die square on all sides, except in the case of mouldings or where otherwise directed. All sizes of stones shown on the detail drawings are to be followed exactly, and the stonework is to be put together with slate dowels 1in. by 1in. by 3in. long fitted to square cut mortises and run with cement. The cramps to cornices and copings to be of bronze and run with Spence's metal.

Mouldings.—The plinths, arch-moulds, cornices, and all other mouldings are to be carefully worked in accordance with the details supplied, and all mitres are to be truly struck.

Carving.—Provide a p.c. sum of £........, to include the carving of all the caps to columns throughout the portico. Provide a p.c. sum of £........, to include the carving of all the caps to pilasters throughout the portico. Provide a p.c. sum of £........, to include the carving on all keystones where carving is shown. Provide a p.c. sum of £........, to include the turning of all balusters in the parapet wall.

Vaulting.—The vaulting of the portico is to consist of interpenetrating semi-circular barrels in three bays, as shown on the plan of vaulting, with each stone carefully and accurately worked to detail, with semi-circular joggles as shown, and bronze cramps on the extrados.

5. *Give the current prices for the items in the excavator's and bricklayer's work in the basement storey* (sic.) *of a warehouse, the ground floor being 12ft. above road level, and basement storey* (sic.) *10ft. high in the clear.*

This is an unfortunately worded question, for, by the London Building Act, 1894, Part I., section 5, sub-section 11, the apartment designated by the term "basement" should really be called the ground storey. The sub-section is as follows:—

"The expression 'ground storey' means that storey of a building to which there is an entrance from the outside on or near the level of the ground, and where there are two such storeys then the lower of the two." Now, obviously both floors in the question would be entered from ground level, the floor of the so-called basement being about 12in. above that line, while the entrance to the ground storey in the question is 12ft. above ground level, which could scarcely be held to come under the L.B.A. definition of "on or near the level of the ground."

EXCAVATOR.—(The general descriptions would be obtained from the specification).

		£	s.	d.
Yd. cube.	Excavate in manholes and surface trenches and cart away superfluous earth	0	3	6
Yd. cube.	Return, fill and ram earth to trenches after foundations are laid...	0	1	6
Yd. super.	Excavate surface soil 12in. deep, wheel away and deposit where directed	0	1	3

Each.	1¾in. turned balusters 3ft. long	0	1	4
Ft. run.	3½in. by 2½in. moulded oak hand-rail to detail	0	2	6

Enclosures to closets, match-boarding, shelves, dressers, plate-racks, &c., &c.—these are all of lesser importance.

7. *State what questions under an ordinary building contract are to be settled by the architect, and what by the umpire.*

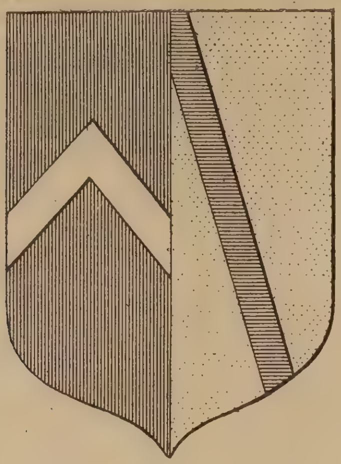
The architect will decide (*a*) whether the work is being carried out in accordance with the true intent of the drawings and specification; (*b*) in the case of discrepancies between the drawings and specification, he will decide which is to be followed; (*c*) and in the case of errors in setting out he will decide whether the contractor is to bear the cost.

The umpire will decide all other cases that may arise in which the contractor and the employer, or the architect on the employer's behalf, fail to agree.

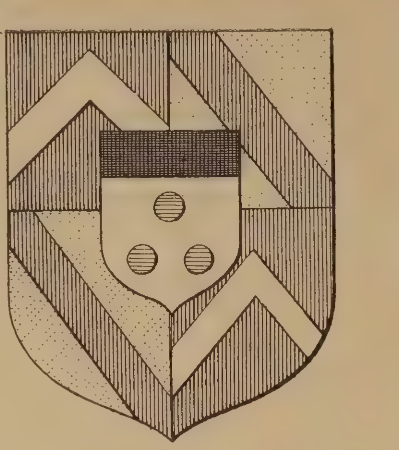
"Scottish Architectural Details," by John W. Small, F.S.A. (Scot.), architect, Stirling, of which a limited edition was published twenty years ago, is to be re-issued by Mr. Eneas Mackay, bookseller, of Stirling. This will practically be a reproduction of Mr. Small's "Leaves from my Sketch-Books," with the plates relative to Market Crosses replaced by others of equal interest, as the former have been incorporated in "Scottish Market Crosses," recently published. The new edition will be limited to 500 copies, issued to subscribers at 30s. per copy net.

A Much-needed Improvement.—It is about time that that ugly block of houses at the junction of Tottenham Court Road with Oxford Street were pulled down. On the western side the block forms a narrow passage known as Bozier's Court, and it is about 190ft. long by about 20ft. wide. Although the dimensions of it are not great, many flourishing businesses have for years been carried on in the houses, and their removal will cost the London County Council £53,860. The work of demolition, which has only just commenced, will give to Tottenham Court Road at this point a width of 110ft.

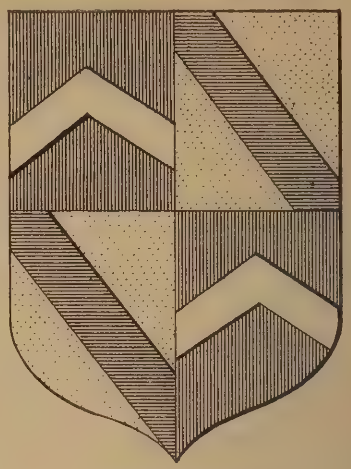
A New Wing at Warneford Hospital, Leamington, has been built at a cost of about £7,000. Connected with the existing hospital by a corridor, the new wing is about 166ft. long and 92ft. wide, and will provide accommodation for about thirty-three patients. It is to be known as the "Victoria" wing. It comprises two wards, each accommodating fourteen beds, and four single wards, as well as bath rooms, lavatories, linen and clothes rooms, kitchens, and other offices. The sanitary blocks of the building are paved with mosaic, and the floors are of patent fireproof construction. The exterior is of red brick, with stone dressings. The work has been carried out by Messrs. G. F. Smith and Sons, of Leamington.



IMPALED OR ACCOLLÉE.



QUARTERED ARMS, WITH SHIELD OF PRETENCE.



QUARTERED ARMS.

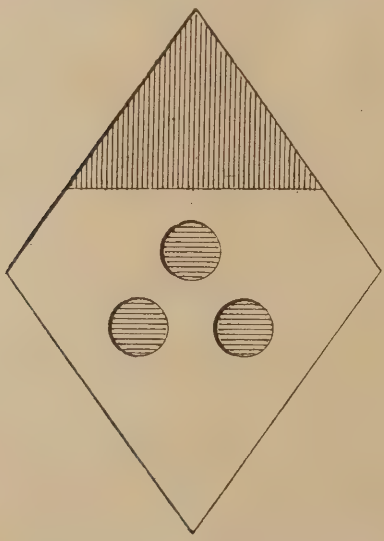
HERALDRY.—II.

By GUY CADOGAN ROTHERY.

(*Continued from page* 351, *No. CCLVII.*)

BLAZONRY AND MARSHALLING OF ARMS.

BLAZONRY is the art of describing in proper terms armorial bearings, badges and other heraldic insignia, so that anybody versed in the somewhat complicated phraseology and stringent rules would be enabled, after reading the description, to make a drawing of the arms. The word blazon is of German origin; it means "to blow," and is derived from the custom of heralds at tournaments, or before two adversaries met to engage in a trial by battle, to first blow a horn and then explain the titles and armorial bearings of those about to enter the lists; thus blazon literally means "to make known."



LOZENGE SHIELD (CONTAINING LADY'S ARMS).

The first rule of blazonry is that when describing a shield, the tincture, that is, colours or metals, should first be mentioned, with the divisions, if any, and their forms. Then the ordinaries and sub-ordinaries are mentioned, and if any of the ordinaries are charged with some heraldic symbols they should be blazoned immediately after the ordinaries, after which the common charges are mentioned; for instance, the arms of Lord Aberdare are thus blazoned: Or, a saltire and a chief gule, the last charged with a martlet of the first. But, in obedience to the third rule, if the above armorial bearings had had a common charge in the base, the description would stand thus: Or, a saltire gule between four crescents azure, on a chief of the second a martlet of the first. Again (rule four), if instead of the saltire there were a star, all common charges, one must not say "four crescents and a star in the middle," but "a star between four crescents," for the charge nearest the middle of the shield must always be mentioned first. Rule five is most strict, and is framed to avoid tautology. The example for the second rule will also do as an example for rule five; it will be noticed that we say, "Or, a saltire and a chief gule, the last charged with a martlet of the first," thus avoiding the repetition of the words or, chief, and gule. The sixth and one of the most stringent rules in English heraldry is, that metal should not be on metal, nor colour on colour. For instance, supposing the field of a shield to be azure, any charge placed on it must be of either one of the two metals, or, to reverse the case, if the shield be argent, the charges must be of one or other of the heraldic tinctures, or furs. This rule, however, does not apply to marks of cadency, or to crowns, chains, or to the claws, tongue, and manes of animals, which are often emblazoned of a different tincture to the animals themselves, in which case metal may be on metal, or colour on colour. Another very stringent rule in English heraldry forbids the use of words formed by letters of the alphabet, or any inscription, being displayed on a shield. The arms of the University of Oxford are, however, a striking exception to the rule. But the English heralds of the seventeenth and eighteenth centuries continually ignored this rule in granting augmentations, or in making fresh grants of arms.

Having blazoned, or described, the field and its charges, the mark of cadency and the badges worn by baronets are next mentioned. And lastly, the outside ornaments, emblazoned in the following order: supporters, coronets, crests, badges, mottoes, and collars or badges of knighthood. It is not necessary to blazon either the helmet or mantling.

Marshalling is the art of emblazoning more than one coat-of-arms on one shield, according to the proper rules of blazonry.

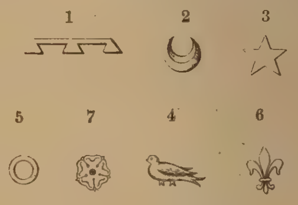
There are five grades of marshalling; they are:—The wearing of a shield of pretence over all, or the quartering of the insignia of their various states by kings, in which case they give precedence to the most ancient or the most important state. An elector may wear his hereditary arms in a shield of pretence over the insignia of his electoral dominions. Oliver Cromwell, notwithstanding that this rule would hardly be applicable in his case, added his paternal arms, in an escutcheon of pretence, to the armorial bearings of the Commonwealth.

Bishops, kings of-arms, heads of colleges, colonial governors, and other dignitaries impale, that is to say, place side by side on the same shield, the arms of their sees or offices with their paternal arms. In these cases the official arms always take precedence, being placed on the dexter side of the paternal arms, which occupy the sinister side of the shield.

A man who marries an heiress (a woman who represents the last of her family) bears her arms in an escutcheon of pretence over his own; his descendants afterwards quartering their maternal and paternal coats.

And, finally, a husband may impale, or as it is generally termed, bear his wife's arms *accollée* to his own, the man's arms being on the dexter side, and the wife's on the sinister. In early times when a husband wore his wife's arms *accollée*, only half of each shield was borne, but this practice soon died out; the only vestige of it as yet remaining is that when one of the shields is emblazoned with a *border* or an *orle*, that portion nearest the second coat of arms is left out.

As has already been shown, the heralds, in order to record the acquisition of new dominions by kings, and to record family alliances, instituted the practice of quartering, when the escutcheon of the newly acquired dominion, or of the heiress, is exhibited on the same shield as that occupied by the paternal arms, and which is, for that purpose, divided by horizontal and perpendicular lines. When the bearer is entitled to only one quartering, the first and fourth quarters exhibit the paternal coat, the second and third the arms of the heiress. Any number of quarterings may be borne on a shield, and if they are of an uneven number, the paternal arms are repeated in the last quarter.



MARKS OF CADENCY.

1. The Label. 2. The Crescent. 3. The Mullet.
4. The Martlet. 5. The Annulet. 6. The Fleur-de-lis.
7. The Rose.

If the coat of an heiress be already quartered, it is known as a *grand quarter.*

The earliest instance of quartering of arms, in England, is that of Castile and Leon shown on the tomb of Eleanor, Queen of Edward I.

In continental heraldry it is a common thing to see shields overcrowded with quarterings, even as many as forty, a practice especially prevalent in Germany, but in English heraldry only the most important alliances are recorded on the paternal shield.

Marks of Cadency are badges worn on the shield, near the top, to denote descent. The label belongs to the eldest son, the crescent to the second, the mullet to the third, the martlet to the fourth, the annulet to the fifth, the fleur-de-lis to the sixth, and the rose to the seventh. Strictly speaking, the eldest son of a second son ought to wear a crescent differenced by a label, and so on.

(*To be continued.*)

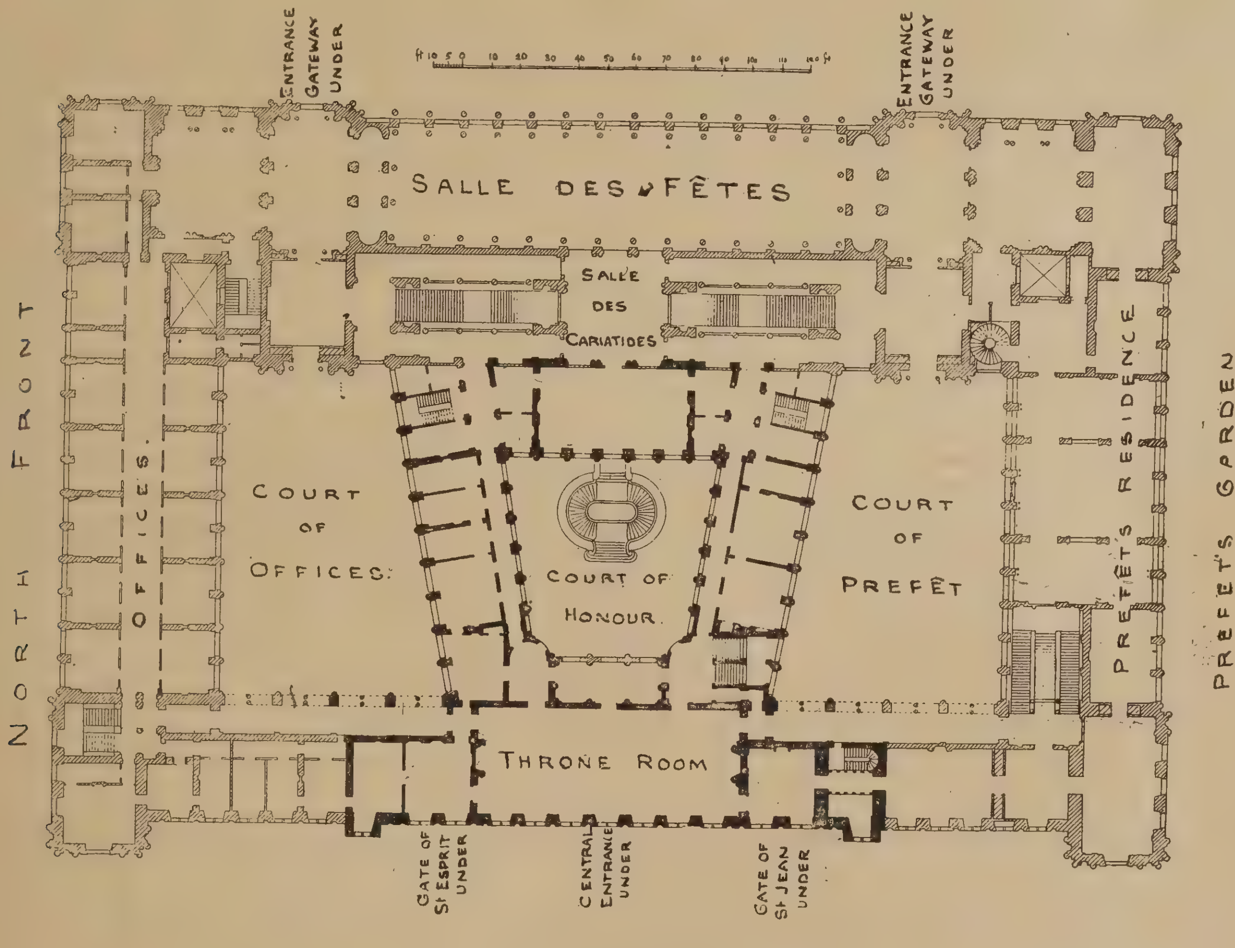
OLD HÔTEL-DE-VILLE, PARIS.

By R. PHENÉ SPIERS.

THE Hôtel-de-Ville was not completed—as shown in the general view on one of our inset sheets—till 1847. The more ancient portion was commenced in 1533, but so slow was the progress made that more than a century elapsed before the original design (shown on the plan on this page and blacked-in) was carried out. The triangular shape of this central block was necessitated by the existence of earlier structures which it was deemed necessary to preserve—namely, the Chapel of the Holy Ghost on the north side and a street called the Rue de Martroi on the south side, which led to a church of St. John in the rear. Those buildings were removed in 1835, and the court of the offices on the north, the court of the "Préfet" on the south, and the grand staircase and Salle-des-Fêtes on the east side were built from the designs of Le Sueur, not being completed till 1847. The only subsequent additions were those made in 1855, when the central court was roofed over with glass and the horseshoe staircase, shown on the plan, was erected. These alterations were made in anticipation of a visit paid by Her Majesty Queen Victoria, who, with the Prince Consort, was received there by the Emperor and Empress in August of the same year.

The destruction of the building by the fire in 1871 was so disastrous that it was decided to reconstruct the whole building on the same lines, so far as the designs of the sixteenth and nineteenth centuries suggested, but with many modifications in the plan and with an increased area. The west front of the original structure was brought forward into the Place de l'Hôtel-de-Ville some 30ft., and the central court was made rectangular, with circular turret staircases in the angles, the picturesque result being far inferior to the original. The fragments of the old front were stored in the garden on the south side and carefully measured, casts being taken of all the sculpture so that, as far as possible, the first design should be adhered to. The two doorways on either side of the central block, originally the porch leading to the Chapel of the Holy Ghost and the archway leading to the Rue de Martroi, were retained as features, and in other respects the main front is reproduced as it existed before the fire. The level of the central court (Cour d'Honneur) was between 12ft. to 14ft. above that of the Place de l'Hôtel-de-Ville, and its pavement was carried on a series of vaults. In order to insure the complete destruction of the building, dynamite had been placed in these by the Communards, and all the vaults were blown up. The view of the Cour d'Honneur (see inset sheet) is therefore taken from a lower level than that originally exposed. The court of the offices is seen in the distance on the left. The arches in the centre of the drawing are those of the arcade on the level of the central court; the horseshoe staircase stood above where the carts are shown. The archways above on the right are those which opened into the hall known as the "Salle-des-Caryatides," the vestibule leading to the Salle-des-Fêtes. The interior of this hall is shown on the inset plate, and the iron rods hanging down are the skeletons of the caryatid figures which formed the chief decoration of the gallery above, all round the hall. This gallery was corbelled out on a coved vault and was a favourite position from which to view the receptions in the hall and the dancing in the Salle-des-Fêtes.

The various relics illustrated are those which decorated the fountain in the centre of and underneath the horseshoe staircase. They had fallen down into the vaults and were probably set up to be photographed before my visit. The only change I made was to turn round the bust of the Empress Eugenie (on the right), as it was too much disfigured.



PLAN OF THE OLD HÔTEL-DE-VILLE, PARIS.

Architectural Photography.

IN a paper on this subject recently read before the Royal Photographic Society, Mr. Henry W. Bennett said that architectural photographs might be broadly divided into two classes, those that aim at giving a pictorial representation of some fine or characteristic piece of architectural work, and those that are simply accurate and faithful reproductions, fulfilling the functions of working or detail drawings, where no attention is given to pictorial effect so long as accuracy and clearness are secured.

Insufficient foreground is a weak point in many architectural photographs. In the desire to show more of the roof and cut off some of the large expanse of floor that is almost always seen on the focussing screen before the rising front is brought into use, there is frequently a danger of cutting off far too much, and considerably detracting from the value of the principal points of the picture. There should, in most cases, be sufficient floor in front of the nearest vertical object to suggest the space that really exists between it and the observer; this sense of space is never conveyed if the floor is cut off immediately in front of any important object.

Distance is a factor that is sometimes overlooked, but it is quite as important as in landscape work. Nothing is worse than to see the whole of a subject on one plane, as is frequently the case when a doorway or similar subject is photographed. There should always be some work, or at least the suggestion of work, beyond the principal point of interest. An open door, suggesting something more distant, will frequently be sufficient when nothing else is available.

It is desirable, when photographing doorways, that an angular rather than a perfectly square view should be taken. When the camera is set exactly in front the result is far too geometrical to be pleasing, and the sense of relief is largely lost, while, with a more angular view, the effectiveness of the picture is not only greater, but the projection or relief of the various parts is better represented, and the character of the whole work more satisfactorily conveyed. In connection with the consideration of perspective, foreground, and distance, the value of lines running into the picture is very great. One or two only will frequently convert a flat meaningless mass into a receding plane.

Any approach to a symmetrical view should always be avoided. In the choir or aisle of a cathedral, for example, the camera should be placed out of the centre, so as to show more of one side than of the other, the perspective lines converging to a point away from the centre, and the side more fully shown should contain the chief point of interest.

There is another quality that does not always receive the attention that it deserves, that of completeness. No architectural photograph can be considered satisfactory if it conveys instinctively the impression of something being wanting to complete the subject, as an arch or a column almost perfect but broken off just incomplete. This is a defect that so frequently occurs in the productions of those that can fairly be called leading workers that it is necessary to emphasise it as a fault very strongly.

The most suitable weather for interior work is when there are plenty of light clouds, especially if they are low down; the light is so diffused that dark corners are better illuminated, and the lighting of the whole building is soft and harmonious. A grey or dull day is equally good as regards effect, but the exposures are necessarily longer. One of the great difficulties to contend against is the tendency to harsh and hard contrasts.

The lens is the most important tool for architectural work. The value of modern anastigmatic lenses to the architectural worker can scarcely be over-estimated. If the lens covers ninety-five to one hundred degrees, it allows the rising front to be freely used without any risk of the corners of the picture being cut off.

With regard to perspective, it should be recognised that the relative sizes of objects at different distances is independent of the focus of the lens, and depends entirely on their relative distances from the camera. A length of focus rather less than the length of the plate to about one and one-third times appears to be the most satisfactory.

In photography the most natural and pleasing effect is obtained if the camera is placed as near as possible to the normal height of vision, that is 5ft. to 6ft. from the ground. Buildings are designed to be seen from the ground, and the character of the work at different elevations is largely due to this fact. It is only necessary to ask you to compare the effect of photographing the exterior of a building having a large projecting cornice 15ft. or 20ft. above the ground, first from the ground and afterwards from a height of, say, 30ft., to emphasise this point. In the first case all the work of the cornice is represented as it appears to the observer; in the second this cornice is shown as a plain, flat surface, with perhaps a few gutters for the rain to run off.

Exposure is a difficult problem in interior work, so many factors have to be taken into consideration. It is impossible to formulate rules, as the conditions change so much, but a well-lighted cathedral nave will be fully exposed in eight or ten minutes, using f/32, and a plate of the speed of Ilford Ordinary in the best spring or early summer light, while for the choirs of most cathedrals, which are generally very dimly lighted, and the light is strongest on the upper light stonework rather than on the dark oak stalls, where the photographer wants it, an hour and a half to two hours would be necessary under the same conditions.

A subject should be rendered as it appears; a very dark crypt, for example, if one remains in it a long time, has its details plainly visible, but it is still dark, and should appear so in any representation that claims to be good, and a light interior should be light; any other rendering is false and incorrect. Light buildings are frequently shown dull and gloomy, because such an effect is considered by many to be more impressive and pictorial; it appears, however, to be due to a thoroughly false conception of what constitutes "quality" in a picture.

In a pictorial photograph of architecture detail and sharp definition are as essential as in any architectural photograph. There is so much character in the architecture itself that the photograph fails completely if it does not reproduce it. If detail and definition are lost, the character is lost also; retaining either is not inconsistent with true pictorial quality.

The foregoing paper is given *in extenso* in the issue of "Photography" for January 18th; it is also illustrated by several line blocks showing defects and remedies in architectural photography.

JOHN RUSKIN.

MR. JOHN RUSKIN is dead. Attacked with influenza on Thursday last, he passed away at two o'clock on Saturday afternoon at Coniston, within three weeks of his 81st birthday. So ends a great career; truly great in that it was noble and strong and good, and exerted a powerful influence towards the amelioration of human life and work, and the general uplifting of humanity. The value of Ruskin's teachings is inestimable, for they are far-reaching, and touch those hidden and subtle springs which form the source of our actions and thoughts. He made men think, and made them take interest in what they were thinking about; he showed them this was right and that was wrong, and why it was so. Idealist and critic, teacher and master, poet, prophet—such was John Ruskin. And his death breaks the thread which connected us to one of our greatest countrymen, one to whom the world will always point as a great fighter in the cause of Truth and Liberty.

Mr. Ruskin, son of a London merchant, was born in (now No. 54) Hunter Street, Brunswick Square, on Feb. 8th, 1819. He was educated at Christ Church, Oxford, gaining the Newdigate prize for English poetry in 1839. He next devoted himself to painting, but so early as 1836 he had entered a field in which he was destined to be an enthusiast and fighter. He wrote a paper in defence of Turner, and though it was not published at the time, the year is significant as marking the beginning of his battle on behalf of modern art. The Turner study, so to say, developed into the first stage of the famous "Modern Painters," the opening volume of which appeared in 1843.

Therein he sought to prove the superiority of modern landscape painters, and more especially of Turner, to the Old Masters. Other volumes of this work appeared at intervals till 1860, and in these later portions he travelled over a wide area, and the book became a discursive treatise on the principles of art, with artistic and symbolical descriptions of nature written with a boldness of imagination that had never been known before. The critics were contemptuous, but Ruskin's writings undoubtedly had a great influence on the art of his time.

In 1849 he published "The Seven Lamps of Architecture," in which he tried to inculcate a new and loftier conception of the significance of domestic architecture; and in 1851-3 "The Stones of Venice" followed with similar purport. Both these books, as well as the later editions of "Modern Painters," were illustrated with beautiful drawings by the author. About this time pre-Raphaelitism began to be talked about, and John Ruskin took up the cause. He was its first literary advocate, and he defined the aim of the movement as being "To paint things as they probably did look and happen, not as, by rules of art developed under Raphael, they might be supposed gracefully, sublimely, or deliciously to have happened." In this controversy Ruskin wielded a vigorous pen, and, indeed, all his life he has been in the midst of controversy. He attacked some of Whistler's pictures, and suggested that they were like throwing a pot of paint in the face of the British public, to which Mr. Whistler replied that Mr. Ruskin's opinion on art was likely to be of the same value as that of the policeman who watched the gallery.

Ruskin had a curious fancy in titles, and you could usually be certain that the title gave no indication of the contents. For instance, "Sesame and Lilies" consists of lectures on good literature; "Ethics of the Dust" is a set of essays on crystallisation; and in "Unto this Last," which Ruskin considered the best of his books, he attacks the current views of the "dismal science." From 1871 to 1884 he wrote a series of "Letters to the Workmen and Labourers of England," and these were gathered into a book called "Fors Clavigera." One of the most charming books of autobiography we have is his account of his early days, written under the title "Praeterita."

Ruskin held the position of Slade Professor of Art at Oxford from 1869 to 1879, and when he was re-elected in 1883 the crowd that came to hear him was so great that he had to deliver each lecture twice. In 1871 he gave £5,000 for the endowment of a master of drawing at Oxford. Subsequently he founded a museum at Walkley, near Sheffield (in 1890 presented to Sheffield itself), and presented to it part of his priceless library and art treasures. In later years he resided at Brantwood, on Coniston Lake, in his beloved Lake District, and there it was he died.

The funeral has been fixed to take place at Coniston Churchyard to-morrow (Thursday) afternoon. The remains of Mr. Ruskin will lie in state in Coniston Churchyard from noon to-day.

Correspondence.

PENCIL MARKS ON LATRINE WALLS.

To the Editor of THE BUILDERS' JOURNAL.

GLASGOW.

SIR,—With reference to the reply on page 355, in the issue for January 10th, a schoolmaster friend of mine has adopted a very effective mode of preventing markings on walls, so common about a school. When he finds a new-comer has taken to marking the walls he reads the story of David in the cave of Adullam; the rest can safely be left to the other boys in the school.—Yours faithfully,

ISAAC LOW.

New Buildings in Inverness.—A block of buildings 240ft. long and four storeys high is to be built in Church Street and Queensgate at an estimated cost of £25,000. There will be shops on the ground floor and offices above, while accommodation is to be made for a hotel in the centre of the building. Mr. W. L. Carruthers, of Union Street, Inverness, is the architect.

London Water: Royal Commission's Report.—On Monday morning last the final report of the Royal Commission on the London Water Supply (in the form of a Blue-book) was issued. They are satisfied that the present sources of supply will be sufficient up to 1941. With regard to the Welsh water scheme, they seem to indicate that before this time a better scheme will have been found. The Commissioners are unanimous in their conclusion that it is desirable that the undertakings of the water companies should be acquired and managed by a public authority. They come to the conclusion, also, that it is not desirable that the London County Council should be the purchaser, but that the companies' undertakings should be transferred to a permanent Water Board, consisting of not more than thirty members, appointed by the county councils of London, Middlesex, Surrey, Essex, Hertford, and Kent, the West Ham Council, and the Thames and Lea Conservators.

A TRIBUTE TO JOHN RUSKIN.

PRIZE AWARDS.

AT the meeting of the Royal Institute of British Architects last Monday evening the chair was taken by Mr. J. M. Brydon (vice-president). After the passing of the minutes, the chairman referred to the death of Mr. Ruskin, an honorary Fellow of the Institute. Everyone must feel, said Mr. Brydon, that a great personality, who had been a power in this country for the past half century, had passed away. No man influenced architecture as Ruskin did. He was responsible for that wave of Venetian Gothic which passed over our country. He was probably the man who first woke up the English people to a knowledge of what Art meant, Art in the life of the people as an ennobling factor that raised men and made them think of higher and nobler things.

Ruskin's Influence on Architecture.

Probably no work had had more influence on architecture in this country than that magnificent book "The Seven Lamps of Architecture," and particularly those chapters that dealt with Truth and with Sacrifice. The idea of truth was held in a very hazy fashion, and probably the idea of sacrifice for art's sake had never occurred to ninety-nine out of a hundred people in England until Ruskin told them what it meant. Probably we were too near to Ruskin now to estimate aright the part he played in English life, literature, and art criticism. He (Mr. Brydon) suggested to the Literature Committee that a paper might be written on the great influence of Ruskin on architecture in this country. He concluded by moving a vote of condolence with Mr. Ruskin's relatives. Letters were read asking for contributions from architects towards the Artists' War Fund and the exhibition now open at the Guildhall. All communications may be addressed to Mr. M. H. Spielmann at the Arts Club. The vote having been unanimously adopted, the president proceeded to announce the

AWARDS OF PRIZES AND STUDENTSHIPS

made by the Institute for 1899-1900. These were as follows:—

The Institute silver medal and twenty-five guineas for a review of the architecture of the Elizabethan period (about 1550-1620) was gained by Robert W. Carden ("Thelma"), of London.

The Institute silver medal and ten guineas for a set of measured drawings of ancient buildings in the United Kingdom or abroad, was gained by James B. Fulton ("Unicorn"), of London, N.W., for his drawings of St. John's College, Oxford. A certificate of honourable mention was also awarded to H. Inigo Triggs ("White Wheel"), of London, W., for his drawings of Raynham Hall, Norfolk.

The Soane Medallion and £100, for continental travel, was gained by Cyril E. Power (S. Barbara), of London, W.C., for his design for a School of Fine Art.

The Owen Jones studentship (certificate and £100), for travel and study of colour, was gained by George A. Paterson, of Glasgow. Medals of merit were also awarded to James B. Fulton and J. Hervey Rutherford.

The Pugin studentship (silver medal and £40), for travel in the United Kingdom, was gained by James M'Lachlan, of Edinburgh. Medals of merit were awarded to E. W. Turner, of Peterborough, and J. A. Woore, of Derby.

The Godwin Bursary (silver medal and £40), for travel outside the United Kingdom, was gained by Sidney K. Greenslade, of Exeter.

The Tite prize (certificate and £30), for travel in Italy, was gained by Percy E. Nobbs ("Edificaturus"), of Edinburgh, for his design for an isolated clock tower and belfry. A medal of merit was awarded to William Arthur Mellon ("Bow Bells"), of London, E.C.

The Grissell gold medal and ten guineas, for design and construction, was gained by Charles E. Varndell ("Loire"), of London, S.W., for his design for a spiral staircase.

The Ashpitel prize of books, value £10, was gained by Raymond Turner Barker, of London.

The Council approved of the work of Mr. J. Hervey Rutherford (Pugin student 1899) and of Mr. James B. Fulton (Tite prizewinner 1899), and of the report of Mr. W. Wonnacott (Godwin Bursary prizewinner 1899). With regard to the work of Mr. A. E. Henderson (Owen Jones student 1897), the Council were so pleased with it that they had decided to grant the author an extra £50, to enable him to continue his studies in Constantinople.

Mr. Basil Chamneys, B.A., then read his paper on

THE JOHN RYLANDS LIBRARY, MANCHESTER.

The circumstances, he said, which led to his being asked to undertake the building of the Rylands Library dictated, to a considerable extent, its general style and conformation. With a view to the selection of an architect, Mrs. Rylands and her advisers had visited many buildings, among others Mansfield College, Oxford, with which, and especially with the Library, she was satisfied as fulfilling generally the intention and corresponding with the idea she had formed. Being commissioned to prepare a plan, the author concluded that the type of building must correspond to some extent to that of a college library, and that the style most adapted to the idea, and likely to satisfy his client, was that of Mansfield College. There were, however, special requirements which college libraries do not include. A very large number of books were to be accommodated. There were to be two independent departments—one for reference books, the other for loan—involving two separate entrances. Three large rooms were to be provided, one specially large for the purposes of conference, and two smaller for ordinary committees; rooms for the librarians in close communication with the principal library; refreshment rooms for staff and visitors, with the necessary offices; rooms for unpacking, sorting, &c.; a caretaker's house, detached, but in close connection with the library; accommodation for engines and dynamos for electric light, and basement for hot-water washing and stowage, and for the preservation of muniments; a large and important vestibule, and ample and imposing staircase or staircases. The building to be as far as possible fireproof.

Architectural Conditions.

The existence of ancient lights on almost all sides of the site dictated to a large extent the general conformation. As the position made it impossible that any but the steepest roof could be rendered visible, and there was no loss of architectural effect involved, timber roofs were omitted almost altogether. The stone bantling was covered with concrete brought to a level, and covered with asphalte.

The author then gave a full description of the building, the disposition of the rooms, and the manner in which he had met the various requirements.

With a view to obtaining adequate daylight for the library itself, to avoid unnecessary interference with the rights of adjoining owners, and to secure quiet, the library was placed on the upper floor, some 30ft. from the pavement level, and set back about 12ft. from the boundary line at the sides. On the lower floor on either side a cloister or corridor, giving access to the ground floor rooms, occupies the remaining space, and is kept low (about 9ft. high internally) so as to allow of ample windows above it for lighting the ground floor rooms, which are about 21ft. high. The whole of the front of the building is occupied by a spacious, vaulted vestibule, the ceiling being carried on shafts.

The library consists of a central corridor 20ft. wide, and 125ft. long, terminating in an apse, together giving an extreme length of 148ft. The central hall is 44ft. from the floor to the vaulted ceiling, and is throughout groined in stone. It is divided into eight bays, one of which is on one side occupied by the main entrance, while the rest open into reading recesses. On this floor there are fifteen recesses occupied by bookcases. Two staircases, one at either end of the main library, lead from the lower to the upper floor. The reading spaces on both floors have bay windows; on the lower floor their ceilings are of oak ribs and modelled plaster; on the upper floor they are vaulted.

Material and Colour.

Adjoining the caretaker's house, which is separated from, but in immediate connection with, the main building, is a spiral staircase which leads to all the floors of the main building, and under the house are the boilers and furnace for the hot-water warming. The material used is mainly stone from quarries near Penrith. That used for the interior throughout is shawk, a stone that varies in colour from grey to a delicate tone of red. Much care has been exercised in the distribution of the tints, which are for the most part banded in an irregular combination. Many of the stones show both colours in a mottled form and serve to bring the tints together. As towards the completion of the building it proved impossible to obtain a sufficient quantity of mottled stone, the main vaulting of the library had to be built in a way that gives a more banded effect than was originally contemplated.

Appropriate carvings decorate the several parts of the exterior of the building. Facing the main doorway is a symbolical group, carved in the stone employed throughout the interior of the building. The sculptor was Mr. John Cassidy, of Manchester.

Statuary and Stained Glass.

A series of portrait statues by Mr. Robert Bridgman, of Lichfield, has been designed and arranged so as to represent many of the most eminent men of different countries and ages in the several departments of literature, science, and art. These are placed for the most part in pairs marking both correspondences and contrasts in character and achievement. The statues, twenty in number, are ranged in niches along the gallery front. They are supplemented by a series of pictured effigies in the two stained glass windows, designed and wrought by Mr. C. E. Kempe, each window containing twenty figures, taken, wherever possible, from contemporary portraits. The great north window is symbolical of Theology. The south window represents Literature and Art. The main design of the library, in its bearing upon philosophy, ethics, and intellectual culture, is further illustrated by a series of Latin mottoes, carved on ribbon scrolls between the windows of the clerestory, a painter's device being below each motto. The fronts of the bookcases consist of very large sheets of plate-glass (9ft. 9in. by 2in.) contained in gun-metal frames. The exclusion of dust is provided for by rolls of velvet, made elastic by the insertion of wool, which, when the doors are closed, are pressed between the door and a fillet.

A discussion followed, in which Messrs. Aston Webb, Beresford Pite, H. H. Statham, and others took part. All the speakers expressed generous appreciation of the library, and a vote of thanks was heartily acorded to the lecturer, who, in response to requests, gave further details on several points connected with the building.

More Light on the District Railway.—The District Railway Company have commenced a new system of lighting their stations, which are often invested in semi-darkness. At present the light is excluded by the shelters for passengers on the up and down sides of the platform; in future the shelter roofs will be pierced, and fitted with glass skylights. These improvements have already been carried into effect at Westminster Bridge Station, and the result is most satisfactory. Five large skylights have been let into the roofs of the shelters on each side of the platform, and care has been taken to prevent the percolation of rain-water through the framework.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"*The moment a man can really do his work, he becomes speechless about it. All words become idle to him—all theories.*"—RUSKIN.

Vacancies at the Academy. A general assembly of the Royal Academy has been convened for Tuesday next, when the three vacancies in the ranks of the Associates will be filled. Two of these are due to the co-option of two Associates, Messrs. Abbey and Gregory, and one to the death of Sir Arthur Blomfield. There are thus two painters' places to be filled and one vacancy caused by the death of an architect. An architect will probably be elected to supply this last vacancy, though there is no rule. At present, amongst the Associates there are only two architects, Messrs. Bodley and Aston Webb, and Mr. Aston Webb's election is of recent date. The claims of an outside architect are generally much better known to the members of his own profession than to the public, who take no interest in plans, and, unfortunately, very little in buildings. For this vacancy Mr. Belcher is at present certainly the favourite. Then there are the other two vacancies. Though they are created by the promotion of painters, it is not unlikely that they will be filled by the election of a painter and a sculptor. Mr. Joseph Farquharson has been in the running, and well forward in the running, for the last two or three years. If a sculptor should be elected, the choice is said to lie between Mr. Pomeroy and Mr. Drury.

Romsey Abbey. ROMSEY Abbey Church, in Hampshire, is proposed to be restored, for which £5,000 is needed. The monastic buildings have long ago disappeared, but the magnificent church remains—possibly because the nave always served the purpose of a parish church. It is the most perfect example of a Norman abbey church of moderate dimensions in England, being about 240ft. long by 120ft. across the transepts. The whole building is, as far as the shell goes, Norman work, though the western portion of the nave was reconstructed in the thirteenth century and the eastern windows of the choir were altered during the fourteenth century. A lady chapel was added about the same period, but has ceased to exist for many years. Romsey Abbey Church is remarkable for the singularly regular treatment of its plan, one side being a counterpart of the other, and it is probably the only ancient church in England in which this is to be seen. Like most of the Hampshire churches, the tower is low and does not rise more than a few feet above the roofs of the "crossing." It is crowned by a lantern of wood covered with metal. Although the exterior of the building is rather plain, there is a considerable amount of carving to be seen internally.

Wellington's Monument. THE Dean and Chapter of St. Paul's Cathedral have accepted an offer from the Department of Works to place around the Wellington Monument a barrier ornamented with twelve of those admirably-executed little bronze lions modelled by Alfred Stevens, the sculptor of the monument, which for many years stood on the pillars of the boundary railing of the British Museum. This railing was removed about two years ago, and the lions, which possess great merit as works of art, were taken care of by the Department. Several of them are to be seen in some of the galleries of the Museum ornamenting the staircase and balustrades, and it will be generally conceded that no more appropriate site could be found for the remainder than that chosen in St. Paul's Cathedral, around the beautiful monument which is universally regarded as Stevens' masterpiece.

A Town of Ornament. OUDEYPORE is a name which is doubtless unknown to most persons in this country, except for its seeming connection with other Indian names, which appear to many here to have a common suffix with a peculiar prefix. The reason for this is of course that we do not understand the language. But, for all that, Mr. Julian Ralph says in "Harper's" that Oudeypore lies besides a blue lake in a valley rimmed by purple hills, and looks as if it were cut out of statue marble. It is walled, and when you pass through one of its gates you step back a thousand years. No two buildings are of the same height or width, or shape, much less are they of the same pattern. The streets are narrow and twisting, and there are no pavements. The shops on either side are like doorless cupboards, for the walls have never been built in front of the first storey of the buildings. Most of the houses are two and three storeys high, with upper balconies and bay windows, made of panels of stone lattice so finely cut sometimes as to suggest lacework. The buildings, which rise straight up with flat fronts, are never bare, but are decorated with pilasters, half-columns, carved panels, or other ornaments. Wherever there are shops the storeys above are generally supported upon strong columns with elaborate capitals, between which flat stones are projected out and down, at an angle of 40deg., to shade the shops, as we use canvas awnings. "Wherever there were old houses deserted and ready to tumble down," continues Mr. Ralph, "one saw relics of ornaments as rich as any of the newer ones boasted. Now you can begin to imagine Oudeypore, all white formed of such houses, with here and there a great temple made of masses of carved work, or ornament piled upon ornament. Imagine all this enclosed by a battlemented wall and moat on one side, by a lake resembling a sheet of turquoise on the other, and the whole dominated by a palace of enormous size and of immaculate whiteness."

The Benefits of Art Galleries and Schools. THE Right Hon. Jesse Collings, M.P., said recently, at the distribution of certificates to the students at two branch schools of the Birmingham Municipal School of Art, that it was the duty of art teaching to distinguish between what was ugly and what was beautiful; to see the difference, for instance, between a machine-made article and another into which a workman had evidently put his mind; to see in their buildings the difference between a common pattern and one which was the result of the artistic feelings of the architect; for instance, to be able to distinguish between the General Post Office in New Street (Birmingham) and some of their beautiful Board schools. The effect of art teaching upon the population generally would be not only to improve the appearanc of their homes and surroundings, but in their corporate capacity to insist upon beautiful buildings and beautiful public works. For example, there was now a question before the Corporation of the city whether in the tramway system they were about to inaugurate there should be overhead wires or underground cables. He hoped the artistic taste of Birmingham was so far developed that it would insist that the city—in some respects a very fine city—should not be spoilt by overhead wires. He believed they had the finest material in the world so far as the working men were concerned, and so far as their capacity went; but he was afraid that up to recent times very little in the form of training had been bestowed upon them, and in that respect they had to work against odds as compared with their foreign competitors. The production of skilled draughtsmen and good designers was really at the present time a national question—it was one upon which the prosperity, even the existence, of their manufactures depended. The teaching of drawing, even though it might not be carried to any degree of excellence, must have a great effect on learning. Thirty years ago the Art Gallery was a single room in the Free Library building. Now they had one that was the pride of Birmingham, and one of the glories of the city. The educational advantage of such an institution was unseen, but it was very great. Art, therefore, was no longer a perquisite of the rich, but belonged to the people in their corporate capacity. Each one of the working classes could not possess those high-class, expensive works of art, but in their corporate capacity they could have picture galleries and art schools such as no private individual could vie with.

The Cartwright Memorial Hall. THE designs and plans for the Cartwright Memorial Hall, Bradford, are now completed, and the tedious, but necessary, labour of preparing estimates of quantities has at length been finished, and tenders are invited for the completion of the building. The tenders are to include the whole of the work done, in one tender for all trades. They must be delivered by February 6th next, so that by the next Council meeting some definite idea of the cost of the new building may be obtainable, though it is doubtful whether the arrangements will be completed in time for the acceptance of a tender to appear on the agenda of that meeting. Since the plans and designs were drawn, a rise of from 10 to 15 per cent. has, it is said, taken place in the price both of materials and of labour, so that it is possible that the lowest tender will exceed the £40,000 which Lord Masham provided for the purpose of the erection of the hall. In this case it is conceivable that the Council will be asked to make up the deficiency, to avoid, as has been the fate of more than one public work in Bradford, "spoiling the ship for a pennyworth of tar."

The Modern Builder. ST. PAUL'S CHURCH, Chippenham, is the latest addition to the list of churches recently built that have showed a much too rapid decay. At a meeting a week or so back, the rector, the Rev. J. F. Griffiths, said no improvements had been carried out in the church since it was built, forty years ago. The wind whistled round the reading desk like a hurricane, and pieces of plaster fell from the roof during service, while the lighting and heating arrangements were very defective. It was suggested that the exterior of the roof should be covered with slates in preference to the present stone tiles, and that the interior should be lined with wood instead of plaster. Eventually it was decided that the diocesan architect should be consulted as to the state of the building and the probable cost of renovation.

Last of the Holborn Inns. WHAT a deal of interest has been centred round the famous old coaching inns of Holborn, which, one by one, have been disappearing quite latterly. A site for a further extension of the Prudential Assurance Company's offices was cleared by the demolition of Furnival's Inn and "Woods's" Hotel, both built about eighty years ago, the former standing on the site of the block erected in Charles the First's reign, the latter on the site of the hall of the inn. The demolition for the company's offices has embraced "Ridler's" Hotel, which in the days of its chiefest fame as a coaching house was known as the "Bell and Crown," and had retained its pristine aspect of old-fashioned comfort, together with the two quaint old houses, with three shallow bayed fronts at the corner of Leather Lane. Next, eastwards, a Great Western Railway Company's receiving office replaces the "Old Bell," distinguished by its courtyard surrounded with "galleries" and "boxes," and by the coat of arms of Gregge of Bradley, Cheshire, and Starkye of Stretton, quartered, upon its red-brick front. The authenticated history of the "Old Bell," formerly the "Bell," or "Blue Bell," begins with the record of its sale for forty pounds by a conveyance dated March 14th, 1538. Then next east stands the "Black Bull," of which the site is offered for sale on a building lease. The "Black Bull" has upon its front a large sign of a black bull, somewhat out of proportion with the later fortunes of the hostelry, of which the inn yard was taken some years ago for the erection of tenements for the working classes. Its destruction will involve the disappearance of the last survivor of the old coaching inns in Holborn. When that takes place the glory of ancient prestige will belong entirely to the old timbered houses that face Holborn Bars.

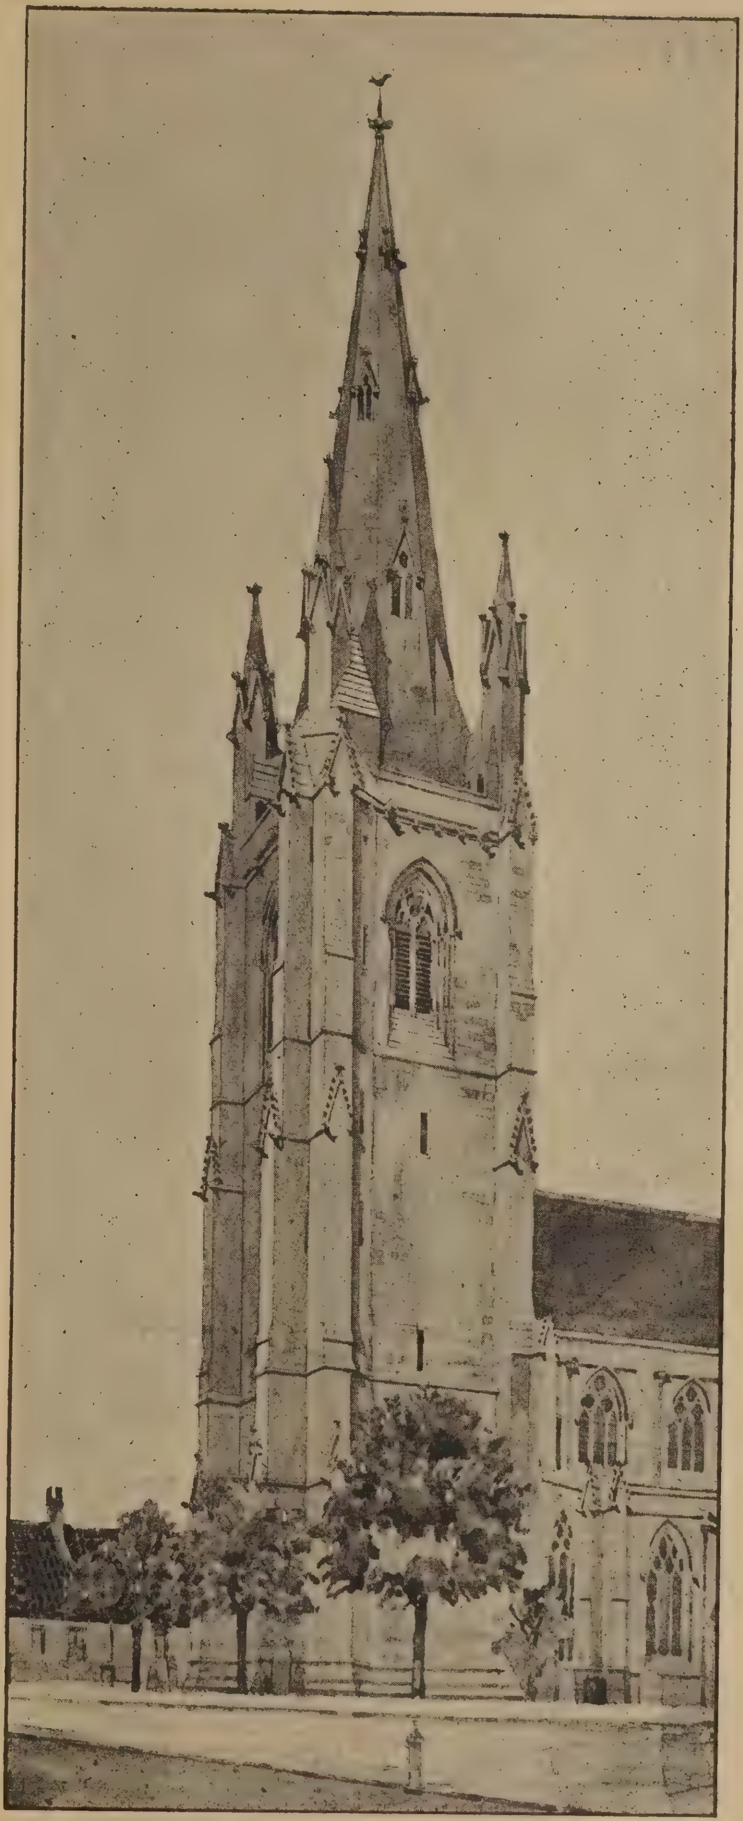
Labourers as Humourists. Labourers of the present day, are not, as a rule, a highly interesting class, but the quality of humour has not been entirely banished from their kind. A specimen of this was found last week during the hearing of a building accident claim at the Shoreditch County Court. This is what ensued in the course of cross-examination: Counsel: What are you?—A bricklayer.—Is that what you would describe yourself as?—Well, a builder—not exactly a builder, but a builder's labourer.—Well, we'll call you a builder's labourer.—I am a navvy.—Come, now, what really are you?—Well, anything in the building line.—Who had charge of the job?—Me, I suppose.—Then you were the foreman?—No.—Then what were you?—Chief hand. The funniest part of the whole story occurred at the conclusion of this interesting dialogue, for it was then discovered that this estimable witness knew nothing about the accident.

Assam's new Consulting Architect. The recently-appointed consulting architect to the Government of Assam is Mr. W. Arundell, whose connection with the Society of Architects dates from its earliest commencement in 1884. He served on the Council from June, 1886, till November, 1887, when he resigned upon leaving this country for India, where he has been engaged in designing railway buildings, and in railway engineering generally, for the Delhi Umballa Kalka, the East Coast, the East Indian and the Assam Bengal Railways. The latter he now leaves for independent practice in Calcutta. Throughout this time he has designed and superintended the erection of many and various other buildings in Umballa, Rawalpindi, Delhi, Calcutta; and in Shillong, where all the buildings were totally destroyed by the earthquake of June 12th, 1897, there will shortly be a new Government House, church, many public offices and private houses from his designs. Mr. Arundell served his articles with the late Mr. J. N. Brown, of Norwich, and for some years was in the office of Mr. Basil Champneys, before going out to India.

Heckington Church, Lincolnshire. The tower and spire of this church, an illustration of which is given on this page, are most refined in proportion and detail, and form one of the best examples of the Decorated period in the country. The masonry is extremely good, the joints being very fine, and the careful finish of the detail is carried out even to the top of the spire. The tower is about 25ft. square at the bottom, and it is about 168ft. to the top of the spire. The church is very interesting throughout. Our illustration is from a drawing by Mr. J. Hervey Rutherford, one of a set that secured the Pugin studentship prize granted by the Royal Institute of British Architects in 1899.

Housing Problem.—A parliamentary petition is now being signed by members of London and Provincial Trades Councils, Trade Union Secretaries, and branches of all societies and clubs for working men, with reference to the better housing of the working classes.

A Woman's Monument.—The obelisk which is to be put up in Darmstadt by the women of the Grand Duchy of Hesse, in memory of the late Grand Duchess Alice, is surrounded by three female figures, and has in front a relief portrait of the late Princess. This design was chosen and approved by the present Grand Duke of Hesse, and is to be carried out by Professor Habich, of Darmstadt.



HECKINGTON CHURCH, LINCOLNSHIRE. DRAWN BY J. HERVEY RUTHERFORD.

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

ESTATE CLERK OF WORKS.

ANXIOUS writes :—"As a subscriber to your paper I should be glad if you would inform me which is the best paper in which to advertise for a post as an estate clerk of works?"

We have no doubt that the querist will find our own columns most satisfactory for such an advertisement as he mentions.

HANDBOOK ON ISOMETRIC PROJECTION.

PUPIL writes :—"Could you inform me of a small handbook on Isometric Projection?"

The best small book our correspondent can have is Davidson's "Orthographical and Isometrical Projection," price 2s. post free, from B. T. Batsford, 94, High Holborn, W.C.

CITY AND GUILDS EXAMINATIONS.

PAISLEY, N.B.—SCOT writes :—"What are the necessary requirements of a candidate who wishes to sit at the City and Guilds, &c., Carpentry and Joinery (Honours) Examination?"

The conditions now in force in the technological examinations of the City and Guilds of London Institute will be found in the "Programme, with Syllabus of Subjects, &c," published by Messrs. Whittaker and Co., of Paternoster Square, London. This programme can be obtained through any bookseller, price 10d. net.

MAKERS OF CLEFT OAK FENCING.

NOTTINGHAM.—F. P. writes :—"Could you give me the name and address of any firm who make the cleft oak fencing which is used in residential districts in the south of England?"

Messrs. Taylor and Brooker, British Timber Works, Dorking; J. and S. Agate, Horsham; G. F. Braggins and Co., Banbury; C. R. Stone, London Road, High Wycombe; H. Hill, King Street, Maidenhead; T. Turner, Limited, Cassiobury Mills, Watford; or Rowland Brothers, Fenny Stratford, will supply the cleft pales, or quote for the "park" fencing erected complete. H. E.

SOCIETY OF ARCHITECTS EXAMINATION.

CLAPTON, N.E.—E. S. E. writes :—"Will you kindly let me know when the next examination takes place? Also, if in this examination it is necessary, in order to qualify, to obtain half marks on the whole number of questions set, both obligatory and voluntary, or on the obligatory only?"

The next examination will be held towards the end of April. It would be best to write to the secretary of the Society, St. James's Hall, Piccadilly, W., for exact information and for form of application. In order to qualify, it is necessary to obtain half marks on the obligatory questions only; but no one with any ambition would aim at a mere pass in any examination. To do so generally means failure.

QUANTITY SURVEYING.

BLACKPOOL.—STUDENT writes :—"Which would you recommend a youth to study most, quantity surveying or architectural work? What is the general routine in a quantity surveyor's office, and what is the salary paid? Whose book on quantity surveying would you recommend?"

The choice between quantity surveying and architecture should depend upon opportunity, aptitude, and inclination. Quantity surveying used to pay very well, but there is not much difference now in any of the professions. Skill and industry will always command a fair return in whatever branch it may be applied. Leaning's "Quantity Surveying" (Spon, 15s.) is the best text-book on the subject, and that describes pretty well the routine of a quantity surveyor's office. HENRY ADAMS.

CONTRACTOR'S CLAIM UNDER ASSIGNMENT.

CARLISLE.—CONTRACTOR writes :—"I made a contract with two builders for work at a price per yard. The builders made a deed of assignment to a building society before the work was completed. Is the building society liable for the balance due to me, as they say it has all to be measured over again? What course may I adopt to secure the balance, as they engaged another man to finish the job?"

So far as we can see, the only remedy that "Contractor" has is against the two builders who employed him. The assignment to the building society did not render the latter liable, as between the society and "Contractor," to pay the debt of the builders. To enable him to sue the society, it should have been mutually agreed between the builders, the society and "Contractor," that the society should become responsible to "Contractor" for the debt of the builders, that the builders should be released from it, and that "Contractor" should accept the liability of the society in lieu of the liability of the builders. If "Contractor" did any work for the society, he is, of course, entitled to recover the price or value of that work from them. A. H.

L.C.C. SCHOLARSHIPS.

LONDON.—ANXIOUS writes :—"I propose to compete for the scholarships offered by the London County Council Technical Education Board for workshop arithmetic, including mensuration, building construction, and geometry. What is a good and cheap book on workshop arithmetic? Does 'geometry' mean only plane, or does it include solid? Is there any limit as to the size of drawing paper to be used? I understand the candidate may choose the sort of drawing he submits for building construction. Do they expect a very advanced one?"

Merrifield's Technical Arithmetic and Mensuration (Macmillan, 3s. 6d., and key, 3s. 6d.) is a good book. Geometry in the Technical Education Board examinations means practical, plane, and solid geometry as taught in classes under the Science and Art Department. The size of drawing paper at examinations is usually limited to a maximum of "Imperial," 30in. by 22in., but half cartridge, 13in. by 21in., is a very handy size when there are several sheets. The drawing submitted must be practical, *i.e.*, show actual construction, and not be merely a copy of an elevation from a book. An original design or drawing from measurements taken by the candidate obtains most credit.

HENRY ADAMS.

TESTING PORTLAND CEMENT.

SOUTH KENSINGTON, W.—G. P. writes :—"Will you kindly inform me what are the qualities and which is the proper way of testing the strength of Portland cement, and good blue lias lime. Could you kindly recommend any work bearing on the subject?"

The chief qualities of Portland cement are: (1) Setting and hardening properties, (2) consistency of volume, (3) permanence in water and air, (4) strength under tension and compression, (5) impermeability by water, (6) resistance to wear, (7) resistance to fire, (8) adhesion to brick and stone. Various methods are employed for testing Portland cement. Weight, ~~fineness, tensile strength~~, and adhesive strength are the principle tests. The specification of a good cement is :—Weight—The cement to weigh not less than 112lbs. per striked bushel. Fineness—To be grained so that not more than 5 per cent. residue shall be left on a sieve having 2,500 meshes to the square inch. Tensile strength—The briquettes at seven days (during six of which they shall be immersed in water) shall not break at less than 350lbs. on the square inch. Blue lias limestone is that from which hydraulic lime is principally obtained. It is somewhat variable in quality, sometimes of a feeble nature, and sometimes of a hydraulic nature. The following is an analysis of a blue lias hydraulic lime :—Lime, 78·43; silica, 9·35; alumina, 6·25; oxide of iron, 0·60; water, carbonic acid, &c., 5·10. Practical information as to the materials used in the manufacture, method of making, analysis, and testing of Portland cement; also useful information about blue lias, are to be seen in "Plastering, Plain and Decorative," published by B. T. Batsford, 94, High Holborn, London, W.C. W. MILLAR.

DAMP WALLS.

KENTISH TOWN, LONDON, N.W.—NORTH LONDON writes :—"I have built a private house, but am much troubled with the flank walls, which face west. Whenever we have wet weather in the winter, and there is moisture in the atmosphere, the paper on these walls seems to attract it, and gives one the idea that the wall is damp. The other walls are not affected. By airing the room or by lighting a fire the appearance very soon disappears. My impression is that the wall, being an exposed and external wall, is colder, and so attracts the moisture. The rooms are always very cold. I should be glad if you could suggest a remedy. Would plastering with Portland cement on the outside be a certain cure and make the room less cold? I find it is the same in 14in. and 9in. work. The bricks used are of a good quality."

It is possible that the damp, and consequently cold, rooms are due to the exposition of the flank walls, but it is more probable that the damp penetrates through the walls, or rather through the brick points, owing to defective mortar, especially as the bricks used are stated to be "of a good quality." The bricks may appear good externally, but still be of a porous nature, which, if so, would encourage moisture during wet weather, and thus cause dampness on the interior surface. An effectual remedy may be obtained by plastering the external surface with good Portland cement, which should be laid by a thoroughly practical plasterer, who knows the nature of the material, the proper admixture as an aggregate, and their proper manipulation. As this class of man is now scarce, I will be pleased to send the name and address of a North-London plasterer whose skill in this particular branch is admitted by all thinking men in the trade. Whoever does the work, see that it is done in dry weather, also that the mortar joints in the brickwork are raked out, and carefully dusted and wetted before any cement is laid.

W. MILLAR.

LEGAL POSITION OF ARCHITECTS.

SYDNEY.—X. Y. Z. writes :—"A contract specifies (in the specification) for a house to be built in a certain manner. As soon as operations are commenced, the client requires and orders numerous important alterations to be made, for which prices are given by the builder. As the client, for the sake of economy, knocked off the provision for contingencies, the architect had no latitude to meet any which might arise. The builder made several concessions—put muranese glass instead of 26oz. in glazed screen, better water piping, &c.—to meet which the architect also made several equivalent concessions, allowing a door to be glazed with 26oz. instead of plate glass (the latter being specified), and an attic storey having been added, a door to attic stairs was omitted by tacit understanding between builder and architect. The client now claims that the specification regarding the plate glass and the attic door shall be carried out, ignoring the fact of concessions on the builder's part, which he claims must be gratuitous and not affect the contract. What is the legal position of the architect? Does his discretionary power 'to be done to the satisfaction of the architect' place the decision in his power, or can the client insist that these matters shall be rigidly carried out?"

An architect has no inherent or implied authority to dispense with or vary the specification. The words "to be done to the satisfaction of the architect" do not confer such an authority upon him, and if the client has not given his sanction, expressly or by implication, to the substitution of 26oz. glass for plate glass, or to the omission of the door, the builder must put in plate glass, and put up the door. A. H.

"REASONABLE WEAR EXCEPTED" IN LEASES.

CHELSEA, S.W.—T. J. E. (Polytechnic Lecturer on Building Construction, &c.) writes:—"What is understood by 'reasonable wear excepted,' as included in general leases. The only clause relating to repairs in the lease reads thus: 'The tenant shall leave the house in the some condition as that in which it is at the date of his entry, reasonable wear excepted.' The house in question was rather old, but was in a fairly good condition; it had been repapered and whitewashed, &c. On the tenant leaving the house, the landlord contends that it is in a dirty state and badly knocked about. This the tenant denies, stating that it had only the ordinary wear of a quiet household. The crucial point is the real meaning of 'reasonable wear.' Is the tenant, at the expiration of his tenancy of three years, liable to have the ceilings whitewashed, walls repapered, &c.?"

"Reasonable wear" means that degree of wear that is inseparable from reasonable use. Whatever deterioration in the condition of the premises results from the gradual operation of time or the elements, comes within the term. For example, if paper, paint or whitewash becomes discoloured from those natural causes which are necessarily at work in the course of the use of a house as a human habitation—faded by the sunlight which enters through the windows, or darkened by the smoke which comes from candles or lamps, or by fog, or smuts floating in the atmosphere—the case is covered by "reasonable wear." Further, a certain amount of deterioration caused by the physical contact of the tenant, his family, servants and visitors, and his furniture will also be covered by "reasonable wear." Thus, painted surfaces which are unavoidably touched by those occupying the house, and papered surfaces against which articles of furniture are commonly placed, must inevitably suffer from such ordinary use. The consequent deterioration in their condition constitutes reasonable wear. The meaning and effect of such clauses as that in the case referred to by our correspondent has not often come up for judicial consideration. The obligation to paint and paper is in most instances expressly defined, and then, of course, a difficulty of interpretation can hardly arise. In a case somewhat like the present, when the tenant was bound by his lease, "as often as necessary well and sufficiently to repair, uphold, sustain, paint, glaze, cleanse, and scour, and keep and leave the premises in such repair, *reasonable wear and tear excepted*," it was decided that the tenant, if he had repaired within a reasonable time before leaving, was only bound, in addition to the repair of actual dilapidations, to clean the old paint, &c., and not to repaint. The wear in the present case appears to have been "reasonable," but this is, of course, a matter of fact on which we can form no opinion. If the house *has* been badly knocked about—paper torn, paint scraped, whitewash soiled, by careless and reckless misuse of the premises—then the wear is not reasonable, and the landlord is entitled to have the covenant fulfilled.

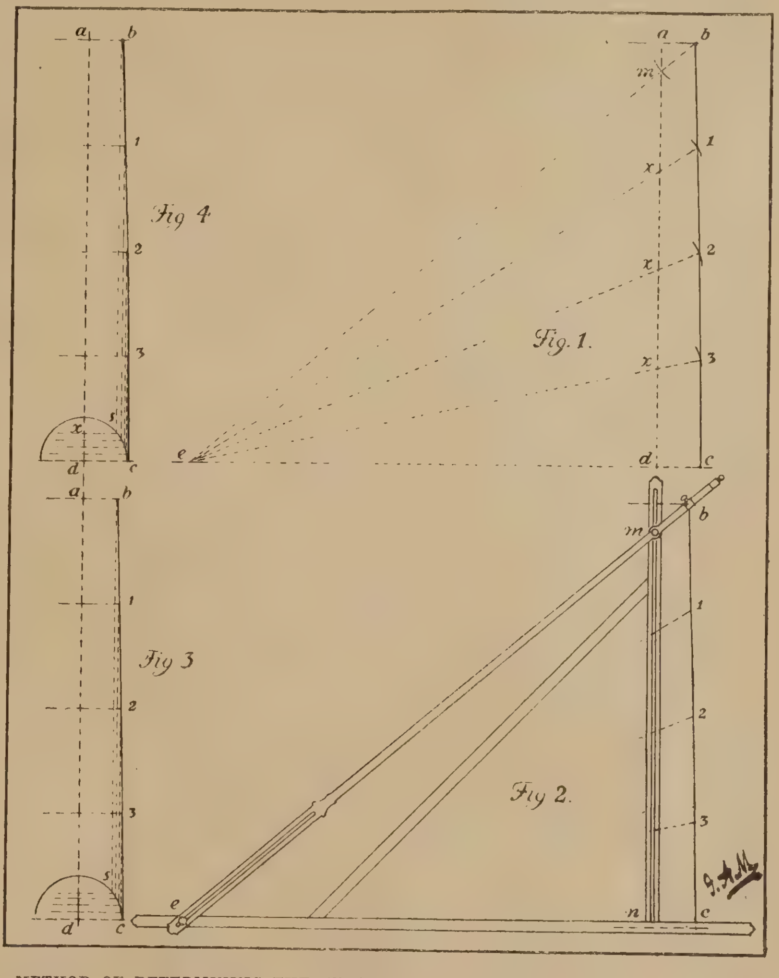
DRAWING ENTASIS OF COLUMN.

ST. LEONARDS.—XYSTUS writes:—"Will you kindly tell me the best way to draw the swelling of the entasis of a Grecian column."

The following are some of the results arrived at by Mr. Penrose respecting the entasis of Greek columns as exemplified in the buildings on the Acropolis at Athens:—

(1) The amount of entasis seems to be no more than is required to correct the effects of the optical illusion. (2) The profile of column is never perpendicular at the base, but the curve begins at the stylobate, and is kept subordinate to the diminution. (3) The amount of entasis depended in some measure on the height of the column, and is found relatively less in smaller than in larger columns. In the shrine of Niké Apteros—where the columns are only 12ft. high—no entasis whatever has been detected. (4) In large columns, different in size, though of the same proportions, the amount of entasis has not been found to vary in quite the same ratio. (5) In every instance—Doric and Ionic—where an entasis has been found, the swelling is almost identical with the curve of a hyperbola whose "principal axis" is small, compared with the other lines employed. In the Parthenon the axes of the curve are horizontal and vertical, but in some other examples they are slightly inclined. The fact of the "principal axis" being the horizontal one gives a quicker curve to the entasis in the lower part of the column than in the upper. The curve of the hyperbola is more complex and refined than that of the other conic sections—the parabola, the ellipsis, or the circle—and it is not known how the Greeks set it out; it is not considered likely, however, that the Greek builders knew how to determine the "elements" of an hyperbola passing through certain points, and although the curve they produced bears a wonderful agreement with that of an hyperbola, it is probable the coincidence was incidental.



METHOD OF DETERMINING THE ENTASIS OF A COLUMN. BY J. A. MARSHALL.

A simple and satisfactory method of drawing the entasis for modern work is shown in the diagram (Fig. 1); *a d* is axis of column, *a b* half the upper, and *d c* half the lower diameter. From point *b* mark off half the lower diameter on the axis at *m*, and continue the line *b m* until it intersects the horizontal line at *e*. Divide the remainder of the axis, from *m* to *d*, into any number of parts, the more the better, but not necessarily equal; draw lines from *e* through the divisions *x x x*, and from these points mark off half the lower diameter on the lines at 1 2 3; these will be the points through which the curve of the entasis is to be drawn. It is sometimes considered desirable to make the contour of the column vertical for one third of the height from the base, the upper two-thirds being treated as just explained.

Fig. 2 shows how the curve can be described full size by means of a trammel. The movable limb *e b* (corresponding to line *e b*, Fig. 1) has a stud at *m* which slides in a vertical groove of the frame *e n m*, while a slot in the lower part of the limb slides on a fixed stud at *e*. By moving the limb down the vertical groove *m n* a pencil at *b* will mark the curve of the entasis through points 1 2 3.

Fig. 3 shows another method; draw a vertical line from necking at point *b* until it cuts the plan at *s*, divide the curve *s c* into a number of equal parts, and the height of column into the same number of equal parts, from the divisions *s c* on the plan draw vertical lines to the corresponding divisions on the elevation, and the points of intersection 1 2 3 give the entasis.

If the divisions *s c* are made equal on the axis, as at *d x*, Fig. 4, a slightly fuller entasis in the upper part of the column will be obtained. JOHN A. MARSHALL.

CHARGES FOR SEWERING AND PAVING.

HASLINGDEN.—H. writes:—"Will you kindly let me know (1) If a Town Council, as the urban authority, can charge a profit on materials used by them in the sewering, excavating, paving, flagging, &c., in streets to the respective owners of property, the work being done in pursuance of the Private Street Works Act, 1892. (2) Have they the power to add another sewer or anything else when this was not shown on their plans, nor given in their estimate or provisional apportionments? (3) Can they charge such addition and apportion the cost amongst the property owners in the streets without giving notice thereof? (4) Can they charge the cost for lowering the gas and water mains when such was not named in their original estimate? These mains were put in some years ago by the respective gas and water companies with the knowledge of the then surveyor of the Local Board, before the incorporation of the town."

(2) Under s. 11 of the Act, the urban authority may from time to time amend their specifications, plans, estimates, and provisional apportionments, but (3) if the expense is thereby increased the revised estimate, &c., must be published, and copies must be served upon the owners liable, so that objections to the proposed additional expenditure may be entertained and dealt with, as provided under ss. 3 and 7. (4) Under s. 9 (1) the urban authority may include any works which they think necessary to bring the street dealt with "as regards sewerage, drainage, or other matters" into conformity with any other streets; and it appears that gas and water mains may be included in such "other matters." But as regards the additional expense involved, due notice must be given, as stated (3) above.

G. H. B.

Views and Reviews.

LOCKWOOD'S PRICE BOOK.

The issue for 1900 of this excellent work has just made its appearance. The book has now become recognised as a standard work of reference, and is so well known that no extended notice of it is necessary. The present edition has been carefully revised, and the prices throughout have been altered and adjusted so as to bring them into harmony with the present state of the market. The prices err, if anything, on the right side, the prices for brickwork, for instance, being considerably over the present ruling prices. The memoranda throughout the volume are most useful, as are the careful annotations of the provisions of the London Building Act, 1894, by Mr. A. J. David, Ll.M., and also his notes of decisions in the courts, which have been brought down to date. A word of praise is due to the very full index, which is placed in the best position—the front of the book.

"Lockwood's Builder's, Architect's, Contractor's and Engineer's Price Book for 1900, with a supplement containing the London Building Act, 1894 and 1898, &c." Edited by Francis T. W. Miller, A.R.I.B.A. London: Crosby, Lockwood, and Son, 7, Stationers' Hall Court, Ludgate Hill. Price 4s.

THE THEORY OF COLOUR.

Mr. Hurst's book is entitled to rank among the manuals for which a place should be found on the shelves of those who, through need or inclination, concern themselves about Colour. It is exact, clearly reasoned, and deals in a sufficiently ample way with colour problems and the mechanism and physiology of colour sensation. The most accepted and probable theories are presented in a simple, concise, and accurate form, as well as the data afforded by recent experiment. The diagrams—more particularly those printed in colours — are effective, fulfil their purpose, and are properly placed in the text.

We think Mr. Hurst has justified his book, and by comparison with the current manual of this type we should say he is entitled to claim more than he has done in the modest preface in which his intents are set forth.

To discuss at any length the problems contained in his pages, or pronounce on the validity of the theories, would lead us far beyond the limit we have to assign for the criticism of purely scientific works, and would be out of our sphere. We are at one with the author in his method. He has no axe to grind, and we get facts, experiments, and theories set down in a simple, clear, and unprejudiced manner.

If, then, he had confined his labours to the exposition of the mechanical laws and physiological bases of colour sensation, we should have had nothing but praise for his efforts; but he has been tempted in the closing chapters into pronouncements on the æsthetics of his subject. Mr. Hurst does not show in these excursions the sound judgment which distinguishes his method in dealing with purely scientific issues, nor the natural gift which is absolutely the one thing needful.

The chaff, however, can be so easily separated from the wheat in his really useful contribution to popular science that its value is but little prejudiced thereby.

A mischievous Fate would seem to be always at hand to allure to indiscretion the writers of scientific works on Colour. From Chevreul to the later essays they have all done their best to deserve the neglect with which artists regard the literature of the subject when it comes in scientific guise, and this, we believe, not for any lack of appreciation on their part, or sympathy with scientific thought, but from causes for which the authors themselves are alone accountable. Setting on one side the specialist, the liberal general reader finds much in them to quicken his interest and to extend his horizon; but to the artist the introduction of more than questionable pronouncements on the æsthetics of colour makes for nothing but unkind mirth or justifiable resentment.

Some red-letter day, possibly, among the chances that give and preserve for us immature Turners or Faradays, enough space will be left in the brain-pan of a pre-destined light of science for the habitation of a good natural sense of colour. It is asking much from Fate, but it is fairly within the limits of the possible. Until then we must wait for the book on Colour.

All this is very delicate ground. It is only natural we should be slow to convince ourselves of shortcomings in the inborn faculties. The possession of a musical ear or a just eye for colour is courteously presumed to be the heritage of all respectable people. It goes upon the same lines as the polite fiction dear to all, that we are born able to manœuvre an army or a fleet, direct a cabinet, or play Hamlet, and probably does very little more harm than any of these pillars of belief. No one fiddles a bit the worse for the most accurate exposition of the laws of harmony in sound. A good colourist may be left chaperonless with his colour box without any fear of the demoralising effect of all the amusing excursions of writers on the harmony of colour, from Chevreul to the present one.

It would be unkind to Mr. Hurst and his good book to select any special propositions as a mark for the scoffers of the studios. We cordially recommend the work for its many real merits. If it should come to a second edition, and we think it certainly deserves more than that, we would advise the author either to carefully prune away the æsthetical or collaborate over friendly pipes with a good painter and colourist. They are not dangerous if properly handled. Mr. Hurst may lay this flattering unction to his soul, he has not sinned nearly so unforgivably as his forbears —especially Chevreul.

F. M.

"Colour." By George H. Hurst, F.C.S. London: Scott, Greenwood and Co., 19, Ludgate Hill, E.C. Price 7s. 6d.

At St. Andrew's Presbyterian Church, Eastbourne, a new organ has been built by Messrs. Bryceson Brothers, of London, at a cost of about £2,000. It is 29ft. high, 20ft. wide and 9ft. 6in. deep.

A New Artificial Pavement that has been adopted in Germany is made by mixing coal-tar with sulphur and warming thoroughly, adding chlorate of lime to the resulting semi-liquid mass. After cooling, the mass is broken into small pieces and mixed with glass or blast furnace glass-slag, the whole being reduced to a powder, which is then subjected to a pressure of 200 atmospheres, and then shaped to the form required. The resistance of this artificial pavement to wear and tear is fully half as great as granite, thus being equal in durability to many stone roads, while its cost is said to be greatly below that of any other form of paving material.

Under Discussion.

FRESH AIR IN ROOMS.

The subject of ventilation was also dealt with by Mr. Isaac Low at the last meeting of the Architectural Section of the Philosophical Society of Glasgow. The object of his paper, he said, was to tell how to make and keep the air in a room sweet and wholesome. Ventilation was the removal of foul air from a place and supplying pure air in its stead, and that might be accomplished by extracting the vitiated air and allowing pure air to take its place, or by forcing in pure air and affording proper opportunities for the exit of foul air, or by a combination of both systems. We required to admit 3,000 cubic feet of fresh air per hour for every person in an apartment. The size of the apartment made practically no difference in the amount of air that it was necessary to admit, unless the occupation by the person was to be made for a very short time; but the size of the apartment, compared with the number occupying it, made a very great difference in the difficulty in supplying the amount of air required without annoying the occupants. Ventilation should be carried out in such a manner that none in the place ventilated should feel any movement of the air, or in any way be made conscious that a system of ventilation was working. That was where their difficulty came in. It had been found that there was an increase in the healthiness and a decrease in the mortality of soldiers by increasing the area of accommodation in barracks to the present standard of 600 cubic feet. No ventilator or system was suitable for every case. Each case must be studied by itself. The two methods of mechanical ventilation were plenum, or propulsion, and the exhaust. He favoured the former method, for with it they could more easily treat the air they admitted. In hospitals which were constantly occupied the organic matter got pressed into the walls by the constant current of air being from the inside outwards. In the exhaust system the current would tend to keep the pores of the walls free from organic matter by always having a negative pressure on the inside. It was not the air they wished to get rid of, but the organic matter that it contained. In a perfectly still atmosphere it would come to the ground or floor lovel, but a perfectly still atmosphere did not exist in a well-ventilated room. That being so, he thought it was only reasonable that they should extract the air from near the ceiling.

VENTILATION WITHOUT DRAUGHTS.

Mr. Arthur Rigg's paper on Wednesday last at the Society of Arts on "Ventilation without Draughts" was distinctly timely. The Houses of Parliament (especially the smoking room), London theatres (all of them), the Academy, railway carriages, the Metropolitan Underground Railway, the new electric railways, the Law Courts, and the theatre of London University all came under the ban of Mr. Rigg as examples of the way in which ventilation ought not to be done; and the only public places selected by him for approval were the lecture theatre of the Society of Arts, and, in a modified sense, the Royal Institution. The reason for this multiplication of failures appeared to be that there are two or three distinct systems of ventilation, which each have their merits, but which, by a perversity of Fate or the builder, are always applied to the wrong places. For instance, the most common form of ventilation, and the one which most commends itself to the public mind, is to allow the hot air to escape at the top of the room and the cold air to filter in from below. But this method has proved a disastrous failure in the House of Lords, and it affords many brilliant opportunities to the insidious and watchful draught, because it creates violent and rapid currents of cold air at points and in places where the warmer air of the room has not time to mix with the newcomer. Hence the draught and the stiff neck. Lord Kelvin's committee at Glasgow adopted a different plan for the new University buildings.

The foul air was removed from below. Inlets for fresh air were fixed high up and distributed round the circumference of the room. Provision was made for forcing in a given supply of fresh air. But novel methods like these, if put in the wrong place, may prove faulty, as, for instance, at the United Service Institution, where no square foot of the theatre is left untraversed by cross currents, and where the cold air coming in from above falls by the force of gravity on the head of general and subaltern alike. The system which Mr Rigg pins his faith to is one in which a regulated quantity of fresh air should be allowed to enter the room at a level about one-third to one-half of the height of the room, and that the air thus entering should be assisted in the process of mixing gradually and naturally with the warmer air of the room by means of a rotating fan. Summing up his paper, Mr. Rigg laid down the following rules:—(1) Ventilation should, as far as possible, be carried out by the plenum and not by the vacuum system; that is to say, by forcing fresh air into a room rather than by drawing air out. (2) Fresh air should be introduced as an upward current from openings above the heads of an audience, but not so high as the ceiling. It should be driven in divided streams into the upper part of the room, so as to mix with warm air already travelling there. (3) Exits for carbonic acid, dust, and watery vapour should be provided at or near to the floor level, if required. (4) The roof or ceiling of a properly ventilated chamber should be hermetically closed. (5) Open windows should only be used during warm weather, never in winter. (6) As natural draughts, cannot always be relied upon, fans, or a furnace, or other means of producing artificial draughts should be resorted to when necessary.

New Patents.

These patents are open to opposition until February 27th.

1898.—Gullies.—20,025. W. Durrant, Felixstowe. Just below the grating is supported a removable funnel, the lower end of which enters an iron bucket in the gully extending below the level of the bucket overflow. At the bottom of the bucket there is a non-return disc valve. The solids fall on this bottom, the light materials float on the water or liquid at the bottom of the funnel, and the comparatively clear water passes out between the funnel and the bucket into the body of the gully and thence into the drain. The idea is to prevent clogging.

Stone Sawing Machinery. — 27,567. J. T. Pearson, Burnley. The circular saw shaft is mounted on a massive base, and the end carrying the saw projects some distance. Below it is a truck on which the block of stone is supported clear. This truck is moved forward by bevel gearing, according to the cut. The saw may have slots, instead of holes, in which the diamond holders are secured. Hand regulating mechanism is provided.

1899.—Closing and Opening Windows.—1,059. H. C. Pruce, Birmingham. The windows are opened by pneumatic or hydraulic means. Each is connected by a system of levers with a vertical piston rod that enters a cylinder at each end. By turning a cock the necessary pressure is admitted, and, according to the cylinder which receives it, the windows open or shut. The invention is applicable to all kinds of windows, shutters, and analogous fittings, which can be held in any intermediate position.

Burning Acetylene Gas.—4,365. J. R. Wigham, Dublin. One of the objections to acetylene gas is that it must either burn full cock or be turned out altogether, as, when turned down the consumption of the carbon is not complete, and smell and smoke result. To obviate this a high pressure needle-hole jet is fixed at the side of each burner. This acts like a by-pass.

Door Hinges.—5,944. C. Rothkegel, Germany. The working surfaces of the hinges are cut in the form of a spiral, and contain a race for balls. The friction is thus greatly reduced, and the door, by reason of the form of the hinges, closes automatically.

The following specifications were published on Saturday last, and are open to opposition until March 6th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1898.—20,645, Maussner, fire and water proof material and method and apparatus for producing it. 27,380, Phillips, machines for making window stile pockets. 27,416, Clay, incandescent gas burners.

1899.—1,411, Le Blanc, apparatus for treating street sweepings and scrapings and town refuse generally. 2,672, Pitkin and Thompson, machines for making expanded metal work. 3,077, Ingham, means or methods of ventilating chimney pots, chimney stacks, and buildings. 3,259, Boyce, chimney pots. 3,426, Brown, joint for pipes constructed on the spigot and socket principle. 3,555, Automatic Universal Gaslighter, Ltd. (*Elsbach and Pollini*), manufacture and mounting of devices for automatically igniting combustible gas. 3,599, B. Mountain and Son, Ltd., and Armistead, machinery for making nails and rivets. 3,796, Anderson, stone sawing machinery. 4,124, Dowsing, electric stoves. 4,194, Wadsworth, dust carts. 4,211, Markham, handles for hatchets, butchers' cleavers, adzes, hammers, and other tools with similar striking action. 4,427, von Kosinski, apparatus for drying newly erected buildings. 4,460, Whittaker and Bryant, filters or like appliances for use in treating or purifying sewage. 4,560, Haws (*Haws*), acetylene gas lamps. 13,556, Perlich, self-igniting gas burner. 14,795, Snyder and West, acetylene gas lamps. 18,048, Knowles (*Krafft and Schüll*), machine for making wire lath supports for venetian blinds, &c. 20,753, Biheller, lanterns or globes chiefly for incandescent gaslights, arc electric lights, &c. 20,929, de Bruyn, artificial building blocks. 20,936, Meiz, manufacture of plain and ornamental or decorated ceramic ware, and moulded articles, panels, cornices, &c. 22,088, British Thomson - Houston Co., Ltd. (*Steinmetz*), incandescent electric lamps. 22,516, Stern, regulated liquid trap for the gas delivery pipes of acetylene gas generators. 22,527, Thompson (*Gebrüder, Buxbaum*), apparatus for carburetting air, or producing "air-gas." 22,714, Straub, plaster, cement and the like. 23,285, British Thomson-Houston Co., Ltd. (*Rice*), electric arc lamps. 23,288, British Thomson-Houston Co., Ltd. (*Wiswell*), inclosed electric arc lamps. 23,502, Jenner, apparatus for raising water and converting it into available power. 23,732, Murphy and Arnold, gas valves or stop cocks. 23,845 Fromholt, means and apparatus for sawing stone or other hard substances.

New Infant Schools at Barry have been built by Mr. Alban Richards, of Barry Dock. They will be formally opened shortly.

The Marquis of Lothian died on Wednesday last. Amongst other offices held by him was the presidency of the Society of Antiquaries. Newbattle Abbey, the picturesque seat of the family, near Edinburgh, is famous for its fine pictures and valuable library, and its interest for antiquarians lies mainly in the fact that the mansion is built on the actual site, and out of the very stones, of the famous Cistercian Abbey.

Artists' War Fund.—The Corporation of London is defraying all expenses in respect of the exhibition at the Guildhall Art Gallery, initiated by the president and members of the Royal Academy in aid of the wives and children of the men now serving in South Africa. Messrs. Clowes and Sons are presenting the catalogue; and the workmen of Messrs. Dicksee and Co., the agents and carriers, have volunteered to work overtime for the exhibition, without payment, as their contribution to the fund.

New Companies.

South Glasgow Property Corporation, Limited.

This company has been registered in Scotland with a capital of £70,000 in £1 shares (35,000 five per cent. cumulative preference), to adopt an agreement with William Hill, 141, West George Street, Glasgow, and to carry on the business of builders, feuars, &c. Registered offices: Baltic Chambers, 50, Wellington Street, Glasgow.

Canney Brick Company, Limited.

This company was registered on January 5th by Withers and Co., 6, Arundel Street, Strand, with a capital of £50,000 in £1 shares, to construct and maintain public works of every description; to undertake and carry out all kinds of reclamation and sanitary works; as timber merchants, sawmillers and sawmill proprietors; as colliery proprietors, coal merchants, &c.; as quarry owners and stone merchants, manufacturers of and dealers in building materials of every description; brick and tile makers, &c. The first directors (of whom there shall be not less than two nor more than five) are A. Mayhew, J. Douglas and J. Barker. Qualification, £250. Remuneration to be fixed by the company.

Stone and Co., Limited.

This company was registered on January 6th by P. le Brun, 30, Plough Road, Rotherhithe, with a capital of £37,000 in £20 shares, to acquire the business now carried on as Stone and Co., Limited (incorporated in 1884), and to carry on the business of brickmakers, merchants, and manufacturers of building materials, &c.

Borough-Green Brickfields, Limited.

This company was registered on January 8th by E. S. Parker, Finsbury House, Blomfield Street, E.C., with a capital of £2,500 in £1 shares, to acquire the business at Borough Green, Kent, by H. J. Lee, and to carry on the business of brick, tile, and pipe manufacturers, &c. The first directors (to number not less than two nor more than five) are H. P. Monckton (chairman) and H. J. Lee (managing director). Remuneration as fixed by the company. Registered office: 32, Walbrook, E.C.

St. John's Estates (Wakefield), Limited.

This company was registered on January 9th by Waterlow and Sons, Limited, London Wall, E.C., with a capital of £10,000 in £5 shares, to acquire the St. John's Estate, Wakefield, and to carry on the business of land and property owners, builders, decorators, contractors, &c. The first directors (to number not less than four nor more than seven) are to be appointed by the subscribers. Qualification, £200. Remuneration as fixed by the company.

West Barnham Estate Company, Limited.

This company was registered on January 10th by Charles and Read, 7, Quality Court, W.C., with a capital of £5,000 in £1 shares, to adopt an agreement with S. S. Marshall, Limited, and the West Barnham Estate, Limited, and to acquire and deal with any land and buildings. The first directors (to number not less than two nor more than seven) are S. S. Marshall, W. W. Pertwee, J. P. Goodacre and C. Stride. Qualification, £55. Remuneration as fixed by the company.

Rotherham Estates Company, Limited.

This company was registered on January 11th by Pashley and Hodgkinson, Rotherham, with a capital of £5,000 in £1 shares, to acquire a freehold building estate at Rotherham, Yorkshire, and to carry on the business of builders, brickmakers, coal and iron masters, stone merchants, &c. The first directors (to number not less than three nor more than five) are E. Hutchinson, G. Williams, M. R. Davies, G. Gummer and J. B. Jenkinson, Qualification, 30 shares. Remuneration as fixed by the company.

Professional Practice.

Aberdeen.—In the Aberdeen Small Debt Court on Thursday last a mason named William Buchan sued James E. Strachan, of Aberdeen, for £3 3s., being repayment of an account incurred to Mr. William Ruxton, architect, for preparing plans, &c., in connection with alterations at and additions to defendant's factory in Back Wynd. The claim was resisted on the ground that the defendant never instructed Mr. Ruxton, and that he had paid the contractor all expenses connected with the work. From the evidence it appeared that the Town Council would not allow the work to be gone on with till plans were prepared and passed, and the plaintiff went to Mr. Ruxton, the nearest architect, to get that done. Mr. Strachan saw him often and consulted with him as to the plans, and Mr. D. T. Byres, C.E., from the borough surveyor's office, deposed that the plans were in the name of the defendant. In giving judgment, Sheriff Burnet held that Mr. Buchan, in employing an architect, acted as agent for Mr. Strachan, whose duty it was to supply plans. These were necessary to let the work proceed. Defendant consulted about them, got the benefit of them, and must pay for them. He gave decree for the amount, with expenses.

Birmingham.—Two new blocks of buildings are being erected in Broad Street. The first block for the London City and Midland Banking Company, is at the corner of Hagley Road and Ladywood Road. The building, designed by Mr. W. Hale, architect, Colmore Row, is in the Renaissance style, the lower portion being executed in red terra-cotta, and the upper portion in buff terra-cotta while the flat wall spaces alone are in red brick. The block is four storeys in height, with a frontage of 80ft. to Ladywood Road and 57ft. to Hagley Road. The elevation is 37ft. to the top of the cornice, from which rises a steep mansard roof containing several dormer windows, while the corner is emphasised by a turret rising to a height of 65ft. from the pavement. Two shops are provided in Hagley Road, the bank occupying the whole of the frontage in Ladywood Road and about 23ft. on the Hagley Road side. The total cost of the building is about £7,000. Lower down Broad Street, at the corner of Sheepcote Street, branch premises have been built for the Birmingham District and Counties Bank. The frontage to Broad Street, including the porch, is 70ft., and to Sheepcote Street 75ft., while the elevation from the pavement is 55ft. The style of the building, designed by Messrs. Bateman and Bateman, of Edmund Street, is English Renaissance. The lower portion is constructed in Hollington stone and the upper part in Leicestershire red brick with stone dressings, the roof being covered with Clynderwyn slates. A feature of the roof architecture is the effective grouping of the chimneys. The public room of the bank on the ground floor is entered through a richly carved stone porch, and the apartments above have been fitted up as a manager's residence. The block of buildings is four storeys in height and its construction involves an expenditure of between £5,000 and £6,000. In addition to these two, other branch banks are in course of erection in Birmingham. For the London City and Midland Bank, Mr. D. Arkell, of Temple Row West, has designed a building in Coventry Road, at the corner of Regent's Park Road. It is classical in style and built of Hollington stone, with half-lead mansard roof, the gable being so arranged as to allow a large clock to be inserted. The building is three storeys in height, with a frontage to each road of 47ft. and an elevation of 43ft. from the pavement. The banking room is on the ground floor, and the rooms above will be let as offices. The cost of the building is estimated at about £10,000. Lloyd's Bank are concerned in the erection of two new branch banks, while two others are undergoing enlargement. The work is being carried out in accordance with the designs of Messrs. J. A. Chatwin and Son, of Colmore Row. The old bank at the corner of Great Hampton Street and Harford Street has been pulled down, and a new one is being built entirely of buff terra-cotta, at an estimated cost of about £7,000. The height of the four-storey building is 50ft., and the frontage to Harford Street is 60ft. and to Great Hampton Street 40ft. The other new bank is being erected on a site at the corner of Monument Road and Beach Street. The building is of brick with terra-cotta dressings, and the height is about 35ft., with a frontage of 50ft. to each of the two roads. The bank at the corner of Stratford Road and Braithwaite Road, Sparkbrook, has been considerably enlarged by the addition of the adjoining house. The upper floors remain, but the ground floor has been reconstructed in Hollington stone and there is now a frontage of 53ft. to Stratford Road and 55ft. to Braithwaite Road. A similar extension has been made to the bank on the Coventry Road, at the corner of Cyril Road, the frontages having been increased to 51ft. in the former road and to 40ft. in the latter.

Bradford.—The elaborate works of decoration which have been in progress for nearly two years past in St. Clement's Church, Barkerend Road, Bradford, have now been completed. When the church was originally built, six years ago, the interior was given an air of distinction by the elaborate moulded and coloured ceiling of fibrous plaster which was put up in the chancel from designs by Mr. G. J. Frampton, A.R.A. This scheme of decoration has been carried throughout under the direction of Mr. W. M. Palin, of London, who conducted one of the biggest schemes of decoration in the country after that of St. Paul's Cathedral—namely, at the McEwan Hall of the Edinburgh University. With the distinctly French character which belongs to the architecture of the building and the "waggon-head" ceilings, comparatively uncommon in England, the church has somewhat of a Continental air. In the chancel Mr. Palin has painted two large frescoes, representing the "Adoration of the Magi" and the Crucifixion. The pictures being 12ft. in height by 9ft. in width, it has been possible to represent the figures life size. Apart from these pictures the walls of the chancel are decorated. The walls of the nave above the aisle arcades have received painted ornaments, and the spandrels are filled with angels holding musical instruments, the latter being executed in relief in coloured and moulded plaster. The wall over the chancel arch is also decorated in a somewhat similar manner, with angels holding a ribbon upon which is the word "Hallelujah." The walls of the aisles have received equally elaborate treatment though in rather a different manner. Between each window the wall has been divided into panels, in each of which appears a conventionalised tree representing the "Tree of Life" rising amid lilies, and on a ribbon various texts are inscribed.

Cardiff.—The Cardiff Intermediate School for Girls is now housed in a new building, which has been built in the Parade at a cost of nearly £30,000. Mr. George Thomas, F.S.I., of Cardiff, is the architect. On the ground floor there is an assembly hall 67ft. by 35ft., connected with corridors to both the new and old schools. On the same floor there are four classrooms, teachers' rooms, and waiting room. On the first floor are four classrooms, music room, and teachers' room; and on the second floor a lecture theatre, a cookery kitchen, studio, science room, and a library are provided. In the basement are a dining hall, kitchen, scullery, &c., a gymnasium, hat and cloak rooms, and lavatories. The new buildings provide classroom accommodation for 252 pupils, and the old school has accommodation for 183 pupils, making a total of 435. The front facing the Parade and the assembly hall are designed after the style of the earlier English Renaissance. The Parade front is executed in Portland stone, and the assembly hall in red brick and Portland stone. The interior of the assembly hall is faced with red brick and Bath stone, and has a panelled dado round it and an open timber roof. The new buildings are lit by the electric light, and heating is by hot water, except in the classrooms, which have Manchester grates. The contractors were Messrs. Lattey and Co.

Edinburgh.—In common with other city congregations in Edinburgh, that of St. Stephen's Free Church, Wemyss Place, has long had under consideration the advisability of transferring the sphere of its labours to one or other of the more populous suburbs. About twelve months ago the move was decided upon, and, after careful deliberation, a site at the east corner of Comely Bank Road and Fettes Avenue (which was at that time occupied by a temporary church) was selected and duly secured. Competitive designs were asked for from a number of Edinburgh and Glasgow architects, and, as a result, that by Messrs. J. N. Scott and A. Lorne Campbell, of 44, Queen Street, Edinburgh, was selected. The site is of considerable area and open, and the plans, for which warrant was granted by the Dean of Guild Court last week, show, in addition to the church proper, a large hall, with retiring and lavatory accommodation attached, while provision is also made for the ultimate erection of a manse. Designed in the later Gothic style, the church has its entrance frontage towards Comely Bank Road, and at the same time presents a picturesque elevation to Fettes Avenue, which at some future time will be still further enhanced by the erection of a lofty square tower, the base of which only is to be erected at present. The plan of the church consists of a nave, with side aisles, transepts and choir. The aisle arcade is lofty, and has a clerestory over, while the choir, the floor of which is raised somewhat above the level of the nave, is also defined by a handsome arch. The tower is situated at the angle formed by the west transept and the nave and the hall immediately behind the choir. The church, which is designed to seat 750 persons, is expected to cost somewhat over £7,000. It is intended to make an immediate start with the building.

Hawkhurst.—At Ticehurst, near Hawkhurst, Sussex, there has been erected, from designs by Mr. Aston Webb, a parish institute, with reading room, games room, billiard room, lavatories, a large entertainment hall, with stage, green room and lavatories, and an ample caretaker's residence of six rooms, with outhouses. The building stands on the high road about three hundred yards from the church, and looks southwards over a recreation ground laid out for football and cricket, with a playground for children annexed. Red brick has been used, and there are some handsome doorways and windows with facings of Bath stone. The doors of the three main entrances are of finely-carved oak, the woodwork of the interior being chiefly of Oregon pine. Gas and electric bells are provided, and the whole building is warmed with hot water coils, though there are cheerful fires as well in the reading and games rooms.

Neath.—The new Board schools comprise two separate blocks, one for boys and girls and the other for infants. The school accommodates 300 boys, 300 girls, and 350 infants, making a total of 950 children. The boys' and girls' school forms the main block, and faces Gnoll Park Road, consisting of a central hall 81ft. by 35ft. surrounded by ten classrooms. On the first floor there are art and cookery rooms and scullery, together with headmaster's and headmistress's rooms, with lavatories. The infants' block comprises a large marching space or assembly hall, with six classrooms and cloak rooms. On the first floor there is a large board room and also mistress's and teachers' rooms, with lavatories conveniently arranged. The rooms are heated by open grates and Musgrave's hot water small-pipe system. The classrooms and hall have pitch pine wood block flooring, and matchboarded dados are arranged for all the rooms. The front elevations are faced with local stone relieved with Bath stone dressings, pediments, coping to gables, &c.; and there are large playgrounds at the back of the school with covered portions, and latrines to each department.

The total area of the site is two acres, and is enclosed by a boundary wall with palisading wall and railing to front and sides. Mr. J. Cook Rees, of Neath, was the architect, and Mr. D. Jenkins, of Swansea, the contractor. The cost has been £10,700.

Norwich.—Shotesham Parish Church has been restored at a cost of about £2,300, under the direction of Mr. W. S. Hicks, architect, of Newcastle-on-Tyne. A new oak roof, new seats, finely-carved oak screens to the chancel and two transept arches, a carved stone pulpit, and a carved stone reredos have been provided. A carved altar and credence table, new prayer desks and sedilia, new brass eagle lectern, new glazing to all the windows (copied from the windows in Milan Cathedral), the substitution of an organ for a harmonium, paving the sanctuary, baptistry, and all aisles with marble paving of various colours, forming baptistry and opening out of tower, erection of new oak screen to baptistry, building of a new vestry, heating the church with hot water, new concrete floor to the entire church, new large window in nave, restoration of tower and porches, making good the walls, panelling chancel walls with oak, new chancel ceiling, new embroidered sanctuary hangings, construction of ringing chamber in the tower, new spiral staircase to tower, repairing all the old stonework in windows, undersetting the walls of tower, and forming concrete trenches round the church—this completes the list of improvements effected. The stone carving was done by Mr. Milburn, of York, the wood carving by Messrs. J. Howard and Sons, of Norwich, the windows by Messrs. Reed and Millican, of Newcastle-on-Tyne, and the carpenter's work for the contractor by Mr. Hurn, of Norwich. Mr. Robert Webb, of Shotesham, was the general contractor. During the restoration several objects of antiquarian interest have been discovered, all of which have been carefully preserved. The most interesting is the stone eagle, which has been replaced in its original position on the sanctus bell gable; it bears the inscription "Veni Emmanuel." The frescoes are also of great interest. Three water stoups and steps leading to the rood loft were also discovered.

Keystones.

A new Congregational Chapel at Blackpool has been built in Alexandra Road, South Shore, from designs by Mr. Nuttal, at a cost of £4,500.

Additions to the Drill Hall, Dundee, have been made from designs by Mr. T. S. Robertson, architect. Three extra rooms for officers, an armoury, two halls, and a sergeants' room have been provided.

Two London Street Names that are to disappear.—The County Council propose to call the whole thoroughfare from Charing Cross to the Parliament Houses by the name of Whitehall, obliterating two historic streets—Parliament Street and King Street.

A new Board Room and Offices at West Hartlepool are being built in Hart Road for the Board of Guardians at a cost, including the site, of £6,000. Mr. Wilson, of West Hartlepool, is the architect, and Messrs. Gradon and Sons, of Durham, are the contractors.

Aberdeen Corporation Lodging House.—The cost of this building has been £11,800, which is about £1,000 in excess of the original estimate. Mr. Dick, of Newcastle, the architect, says that specially strong foundations had to be put in, whilst a considerable amount was spent on the heating apparatus.

A New Theatre at Harrogate, known as the Grand Opera House, has been built on a triangular site between Chapel Street and Cheltenham Parade. The predominating feature of the interior decorations is pure white, and the upholstery is in blue. There are two circles, constructed on the cantilever principle, and the electric light has been installed.

Building Etymology.—According to that high authority, the "Globe," the real origin of the word "brick" is the proud reply of a king to an invading enemy who mocked at his unwalled towns: "My troops are my walls," he answered, "and every soldier is a brick." As a term of endearment it is said to have its origin in the "wall red" undergraduate.

A Rowton House at Liverpool, called "Bevington House," has been built in Bevington Bush, near the west side of St. Martin's Market, Scotland Road, and comprises 500 cubicles, or sleeping apartments, 7ft. 6in. by 5ft., for which the nightly charge is 6d., which includes the use of the other resources of the house. The entire cost of the building is stated to be £25,000.

Forfar Parish Church was re-opened for public worship on Sunday last. For eighteen months it has been closed while the new organ, presented by Mr. James Duncan, was being erected by Messrs. Forster and Andrews, of Hull. Extensive structural alterations were also necessary. The decorations were executed by Messrs. Bowie, Fisher and Co., of Glasgow.

Newcastle Art Gallery: £20,000 Offered.—Mr. F. M. Laing, a rich licensed victualler in the city, has offered £20,000 for an art gallery at Newcastle, provided the public subscribe £8,000 for furnishing and equipment. His idea is to so enlarge upon the design of the public library as to accommodate lending, reference, reading, and all departments on the basement floors, leaving room on the upper floors for the picture galleries.

Additions to Dewsbury Technical School.—On Friday last a new wing to the technical school at Dewsbury was opened. It has cost nearly £6,000, and provides six classrooms, two physical laboratories, and new rooms for the dyeing and weaving departments, including a new loom room, which will be provided with looms of all the types in use in the district for worsted, woollen, cotton, and carpet weaving. Mr. J. Lane Fox was the architect of the building.

Britain and the Paris Exhibition.—Great Britain will be well represented at the Paris Exhibition; first, by a Royal pavilion, which will contain an art exhibition; secondly, by some buildings which have been erected in the Trocadero gardens for India and the British Colonies; thirdly, by several annexes which are to be devoted entirely to British exhibits. The Peninsular and Oriental Steamship Company are constructing a replica of the building they had at the London Naval Exhibition some years ago.

Collapse of a Building at Keighley.—On Friday last an enlargement to the foundry of Messrs. George Hattersley and Sons, Limited, loom makers, Keighley, which was in course of erection, was blown down by the wind, causing considerable damage. The structure was being built upon the wall of the foundry and the old boundary wall of adjoining vacant land, and the skeleton framework of wood and iron had been fixed. The length of the building was about 80ft. or 100ft., and the width about 40ft. It was fortunate that the mishap occurred while the workmen were away at dinner.

The General Staff of Messrs. Young and Marten, Limited, held their annual dniner recently at the new railway stores and siding at Maryland Point, Stratford, London, E. Each chief of department sat at the head of his assistants, and the whole was presided over by Mr. E. Montague Edwards (the managing director), supported by Mr. B. Carter (head of the paperhangings and gas fittings department). In replying to the toasts of "The Firm" and "The Chairman," Mr. Edwards referred to their new premises—which comprise a building having three floors 430ft. by 60ft., and three others 196ft. by 28ft.—and ventured to say that no firm of their kind possessed such stocking area. In addition to this warehouse they had acquired a wharf at Millwall, which gave them still further facilities. During the evening the kindly manner in which the firm treated their employées was alluded to, and received a hearty response.

The Ancient Church of Hengrave, in Suffolk, no portion of which was earlier than 1500, has been restored by Mr. John Wood, who purchased Hengrave Hall about two years ago. The architect was Mr. Herbert Green, of Norwich, and the contractors were Messrs. Cornish and Gaymer, of North Walsham.

COMING EVENTS.

Wednesday, January 24.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. John Castell-Evans, F.I.C., on "Natural Forces: Light, Heat, and Electricity." 8 p.m.

Northern Architectural Association.—Students' Evening.

Society of Arts.—Mr. Meade-King on "Local Government and its Relation to Parish Water Supply and Sewerage." 8 p.m.

Thursday, January 25.

Glasgow Institute of Architects.—General meeting at 2 p.m.

Society of Architects.—Mr. Alfred Roberts, M.S.A., on "The Designing of Electric Lighting Generating Stations." 8 p.m.

Institution of Electrical Engineers.—Meeting at 8 p.m.

Royal College of Art, South Kensington.—Mr. Arthur Thomson, M.A., M.B., on "The Anatomy of the Human Form: The Lower Limb." 6.15 p.m.

Society of Antiquaries of London.—Meeting at 8.30 p.m.

Friday, January 2.

Architectural Association.—Mr. W. R. Lethaby on "Cast Iron." 7.30 p.m.

Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.—Mr. David Skinner on "Notes on Builders' Lifting Appliances." 8 p.m.

Institution of Mechanical Engineers.—Annual Elections. Mr. William Schönheyder, M.I.M.E., on "Water Meters of the Present Day; with special reference to small flows and waste in dribbles." 8 p.m.

Royal College of Art, South Kensington.—Mr. Lewis F. Day on "Ornamental Design."—IV. 11.30 a.m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. John Castell-Evans, F.I.C., on "The Atmosphere: Pressure and Composition." 8 p.m.

Birmingham Architectural Association.—Mr. Paul Waterhouse, F.R.I.B.A., on "A Corner of Old France." 6.45 p.m.

Society of Architects.—Meeting at the Athenæum, Bedford Circus, Exeter. Mr. Ellis Marsland on "The Statutory Registration of the Profession." 6.30 p.m.

Institution of Civil Engineers. (Students' Meeting.)—Mr. C. B. Fox on "The Simplon Tunnel." 8 p.m.

Saturday, January 27.

Dundee Institute of Architecture, Science and Art.—Mr. R. S. Douglas on "Greek and Gothic Abstraction from Natural Forms: A Comparison." 7 p.m.

Institution of Junior Engineers.—Fifteenth Anniversary Dinner at the Westminster Palace Hotel. 6.30 p.m.

People's Palace Architectural Society.—Visit to the New Railway, Mile End Road, at 2.30.

North of England Institute of Mining and Mechanical Engineers (Newcastle-upon-Tyne).—Council Meeting at 1.30 p.m.

Monday, January 29.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. Edward F. Willoughby, M.D., D.P.H., on "Elementary Statistics." 8 p.m.

Surveyors' Institution.—Ordinary General Meeting at 8 p.m.

Royal College of Art, South Kensington.—Mr. Hugh Stannus, F.R.I.B.A., on "The Historic Evolution of Applied Art: XII.—Mahometan Christian Art." 6 p.m.

Society of Arts.—(Cantor Lectures).—Mr. Bennett H. Brough on "Metalliferous Deposits."—II.

London Institution.—Mr. Walter Crane, A.R.W.S., on "The Elements of Linear Empression." 5 p.m.

Tuesday, January 30.

Society of Arts (Applied Art Section).—Mr. Cyril Davenport on "Niello Work." 8 p.m.

Wednesday, January 31.

Society of Arts.—Sir W. M. Conway on "The Undeveloped Resources of the Bolivian Andes." 8 p.m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers).—Mr. John Castell-Evans, F.I.C., on "Air and Ventilation; Combustion and Respiration." 8 p.m.

Northern Architectural Association (Newcastle-upon-Tyne).—An Evening of Notes, by Mr. Jas. T. Cackett, F.R.I.B.A. 7.30 p.m.

British Archæological Association.—Meeting at 8 p.m.

Thursday, February 1.

Royal College of Art, South Kensington.—Mr. Arthur Thomson, M.A., M.B., on "The Anatomy of the Human Form: The Lower Limb." 6.15 p.m.

Civil and Mechanical Engineers Society.—Mr. F. H. Hummel, A.M.I.C.E., on "Graphical Solutions of Certain Problems in Engineering." 8 p.m.

Society of Antiquaries of London.—Meeting at 8 p.m.

Friday, February 2.

Architectural Association.—(Discussion Section.)—Mr. G. M. Nicholson on "Opening-up Land for Building Purposes." 7 p.m.

Sanitary Institute.—(Lectures and Demonstrations for Sanitary Officers.)—Mr. John Castell-Evans, F.I.C., on "Water—Composition, Pollution and Purification." 8.30 p.m

ROYAL COLLEGE OF ART, SOUTH KENSINGTON.—Mr. Lewis F. Day, on "Ornamental Design." 11.30 p.m.

ROYAL INSTITUTION.—Mr. Marconi on "Wireless Telegraphy." 9 p.m.

Saturday, February 3.

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Meeting at Carpenters' Hall at 6 p.m.

SYSTEMS OF SEWERAGE.

At the present time considerable attention and interest is being paid to various systems for the disposal of sewage, each of which has its own advocates and supporters.

Respecting chemical precipitation, Mr. Dibden says: "The results of numerous experiments made by myself on both large and small quantities of sewage liquid have fully demonstrated the fact that the use of an excessive quantity of lime, while affording a rapid settlement of the sludge and a more or less clear effluent, dissolves a by no means inconsiderable quantity of the offensive matter previously in suspension, and this is apt to render the last state of the liquid worse than the first." Of precipitation, Dr. Tidy, in a paper read before the Society of Arts, says: "It is not adequate to produce an effluent of a high degree of purity; where such an effluent is required, it can only be obtained after the sewage has been filtered, under proper conditions, through land on which vegetation is growing." This brings us to a consideration of the sewage farm. Sewage must not stagnate on the land; therefore the land must be carefully gradated into levels. The sewage must pass through, not over, the land; therefore the farm must be carefully underdrained. The process works well at Rugby and at Merthyr Tydfil. Edinburgh has for two hundred years obtained great advantages by the irrigation of the Craigentinny meadows with liquid refuse of the city. Paris, also, has treated a small portion of its sewage in this way, on the plains of Gernevilliers. But of continental examples the most important are Berlin, Danzig, Breslau, and Milan. In the latter city the liquid refuse is collected in large sewers which join one another in a canal called the Vettabbia, which carries the refuse on to about 4,000 acres of land, whence, descending from level to level, it falls into the river Lambro ten miles below the city. It is calculated that to each acre is applied the liquid refuse of about forty persons.

The two kinds of bacteria which destroy refuse, or dead organic matter, are named *aërobic* and *anaërobic*. The former is the agent of and destroys by decomposition; the latter is the agent of and destroys by putrifaction. The *aërobic* is so called because it can work only in the open air. The *anaërobic* receives its name from the fact that it requires little or no air, and is the agent which for centuries has done its work unknown in cesspools. Owing to its labours being carried on in the absence of air, the elements often recombine and form other dangerous compounds, hence the work of the oxidising *aërobic* bacteria is much to be preferred. Miguel estimated that in a gramme of soil at Montsouris there were 750,000 germs; and in the Rue de Monge 2,100,000. Therefore, if sewage be spread over the surface of the soil, freely exposed to the atmosphere, it will be attacked by the bacteria of decomposition, the elements will be oxidised and reduced to mineral form, and the purified water will percolate into the earth, to reappear elsewhere as springs. As the water disappears the air will follow it into the pores of the earth, so that any decomposable matter lodged in them will be attacked and destroyed. If sufficient intervals of rest are given to the piece of ground it will continue to receive and purify indefinitely. This, then, is the sewage-farm broad irrigation system

Experiments with tanks were first carried out in Massachusetts in 1887; these experiments continued intermittently until 1891; then in 1894, Colonel Waring, the experienced American sanitary engineer, erected plant on a practical working scale in Newport, R.I., where the bacterial theory was applied to a filter-bed by artifically supplying a forced air-pressure for the stimulation and sustenance of the bacteria. The sewage was pumped from the main outfall sewer of the city and contained not only fresh waste, but the putrid overflow of many cesspools; yet the results were above the most sanguine expectations. The liquid on leaving the tanks was clear, white, odourless and tasteless. It was collected in a large tank where discolouration would have been at once apparent, and in this tank fish lived and thrived. Colonel Waring states that the engineers and committee drank of it freely and pronounced it good; and frequent chemical analysis proved it to be good drinking water. An average of the figures representing the purification accomplished showed that 92·5 per cent. of the organic matter was removed, and at one time a removal of 99 03 per cent. was effected.

Soon after this experiment Englishmen turned their attention to the matter, with the result that up to the present time six filters at least have been patented, some having intermittent action and some continuous action. They are Scott-Moncrieff's filter, Ducat's filter, Lowcock's filter, with continuous action and with intermittent action, Dibden's "bacteria tank," Cameron's "septic tank," and Garfield's coal filters, patented by Mr. Garfield, engineer of the Wolverhampton Sewage Outfall Works. Dibden's "bacteria tank" is used at Sutton Sewage Works, Surrey; and Cameron's "septic tanks" are in use at both Yeovil and Exeter.

BIRMINGHAM DRAINAGE SCHEME.

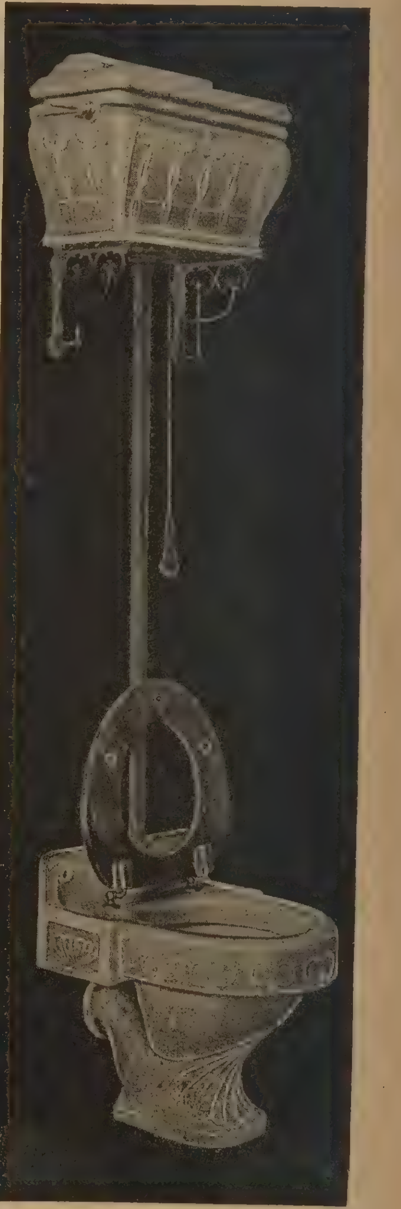
The work of resewering the whole of the city of Birmingham has been authorised by the City Council, and the Public Works Committee, who are responsible for its accomplishment, have commenced with the worst district—that embraced in the area known as Egbaston and Harborne Ward. The cost of this part of the undertaking is estimated at £155,000. The work, which was begun early last summer, is one of considerable magnitude, for it involves the laying down of sixty-four miles of sewers, and will not, it is expected, be completed under four years. The Public Works Committee have about 500 men engaged in the enterprise at Harborne and in the Pershore Road district, while similar operations, conducted by two contractors, are in progress in connection with the Chad Valley sewer and the Rea main sewer. The sewers are laid at the rate of one mile a month. In addition to laying down foul-water pipes, storm-water pipes have to be placed underground, and Mr. Price, the city surveyor, states that it is, as a rule, impossible, having regard to the stability of the work, to carry out the two operations at one time.

With regard to the suggestion that the two sets of pipes might be laid in one trench, thus avoiding the opening of the ground on two separate occasions, the explanation is that it is scarcely practicable, because the outfalls for the two sewers are entirely different. The outfall for the storm water is the river Rea, and that for the foul-water sewer (which is considerably below the level of the bed of the Rea) is Saltley. The foul-water sewer is generally laid at a depth of from 10ft. to 12ft., whereas a depth of 5ft. or 6ft. is sufficient for the storm-water pipes. If there were a difference in depth of not more than 2ft. between the levels of the two sewers it would be possible to place the two sets of pipes in one trench by laying the storm-water pipes on a bench of earth. That is an advantage, however, which rarely occurs, because the difference of the levels, generally speaking, is more than 2ft., and in such cases it would be dangerous to lay the pipes in one trench, since the sinking of the earth, in the process of consolidation, would be intensified in the greater depth, and the result might be a displacement of the earth-bench on which the storm-water pipes rested. If that occurred, the storm-water pipes would be interfered with, their action would not be efficient, and in the course of a comparatively short period the ground might have to be reopened to remedy defects.

Dr. H. H. Vernon, J.P., medical officer of health for the Southport Corporation, died last week at the age of sixty-eight. He was appointed medical officer in 1873, and the main drainage scheme of the town was carried out soon afterwards.

SOME NOTEWORTHY SANITARY APPLIANCES.

A retrospect of the architecture produced during the last hundred years will be less edifying than it ought to be, and to-day there are houses being put up which are a disgrace to those who designed them and to the profession generally. But upon one thing all critics are agreed, presumably because they cannot disagree, that the advances made in sanitary work are both surprising and satisfactory. A comparison of the methods of disposing, for instance, of house refuse at the present time and half a century ago fills us with astonishment that the death rate in the old days was not much higher than it was.



A "TITANITE" CISTERN AND CLOSET.

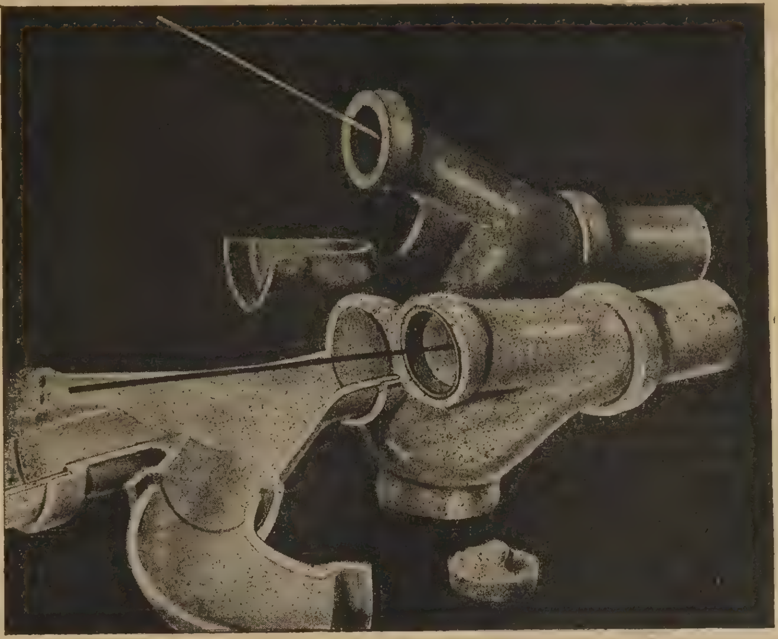
It has been said, and no doubt with much truth, that the present is an engineering age rather than an architectural one, and this being so, it is only natural that improvements follow improvements in all sorts of appliances and systems. Sanitary engineering is no exception to the general rule, though in many branches it can only be in the details that there is scope for improvement; the bases have been found, and will remain unchanged.

In the matter of these details Messrs. Adams and Co., of 72, Park Lane, Leeds, London, &c., have taken much interest. With regard to traps, for instance, it is desirable in modern work to sight from manhole to manhole, and to secure direct inspection. Adams level-eye trap is so formed, the trap itself being twisted slightly to one side, that for inspection and cleansing it is practically level; a rod can thus be freely used, or a light readily seen, from manhole to manhole.

It has formerly been considered proper to case in (with wood, &c.) latrines for barrack use, and to flush these by hand-controlled valves. Messrs. Adams and Co. have supplied a new type. The circular pans are made of very strong glazed ware, and a flat back provides good seat attachments. The pans are connected to a horizontal pipe, at the extreme end of which is a large rubber plug to prevent, until lifted, the exit of water, &c. A flush tank above delivers water direct to a central pipe, from which a supply to each pan is taken. The two plug valves are coupled and raised by the attendant in one operation, thus allowing the outgo of the excreta and its flushing forward by the discharge from above, an excess amount of water filling the pans again to the requisite level. No boxing up or casing is required, and the pans are accessible for cleansing in every part.

Trough closets are undoubtedly convenient. They are not generally, however, as sanitary as it is possible to make an apparatus of the kind. The large open surface of the trough, and the floating matter in the liquid itself waiting removal by the flush, is objectionable and possibly dangerous. To obviate such troubles a latrine has been brought out by Messrs. Adams with pans of strong, highly-glazed ware connected to a horizontal pipe; the form of the pan with the perfectly flat back prevents the accumulation of dirt, &c., behind. Water is retained to a sufficient height, and a flush tank of small capacity discharges at intervals, so that the pans are virtually always free from deposit. The same latrines, as also single pans, may be fitted with pneumatic control, which starts the flush at any desired interval after use. The water supply is thus automatically shut off when not required, effecting a considerable saving.

Messrs. Adams have found it impossible to produce in fire-clay the strong, and, at the same time, high-class goods required in modern work, such as unprotected closets, lavatory basins, &c. They are, therefore, manufacturing these in their new material "Titanite," which is a mixture of clays that lends itself not only to strength of structure and high glaze, but also to artistic design. The closet set illustrated shows this, the cistern and closet being made of "Titanite." It will be seen that the closet has a back skirting, with a vertical flush pipe inlet, the seat being attached by silver-plated hinges. The cistern, as shown, is syphonic. The cistern brackets are of brass, lacquered.



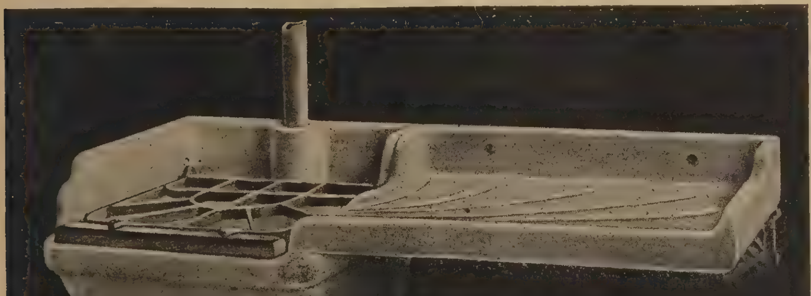
LEVEL-EYE INSPECTION TRAP.

In the asylum or hospital closet set made by the firm there is a flat back, which prevents, as already stated, the accumulation of dirt, and enables a thorough cleansing to be effected, while the square base support gives the strength so necessary for such work, avoiding at the same time the need for building into wall.

The upper portion of the "Lotus" urinal is rectangular, whilst the lower part takes the usual angular form, thus securing more space at the top than exists where capping is of curved or rectangular form. A front outlet discharges direct to the drain, obviating the need for the insanitary open gutter and metal grating.

A new "Bedford" urinal is manufactured by Messrs. Adams in their "Titanite" ware. It is fitted with accessible downpipe, a matter of considerable importance for cleansing when it is realised that to cleanse an ordinary downpipe is impossible, and that the downpipe is generally the chief cause of smell.

The original deep trap automatic flushing tank, as manufactured by Messrs. Adams, does not, like other flush tanks, require a reverse ball valve, a tipping bucket, or other mechanism. It is so constructed that water rises to a level above the dome and gradually overcoming the pressure of air within forces the trap, syphonic action instantly following.



A SLOP SINK.

The slop sink illustrated is an adaptation of the firm's flat back pan, and is formed with a flat back for greater cleanliness, a hinged grating, and, where desired, bed pan cleansing jet, &c., and slop drainer. Constructed of fireclay, the whole forms one of the simplest and most cleanly sinks made.

Messrs. Adams also make a "Titanite" lavatory basin, which looks neat with its light brass (lacquered) brackets. The waste plug is supplied either in white metal or vulcanite.

Where it is desired to construct underground urinals in positions where the sewer is not of sufficient depth, Adams' patent sewage lift may be used with advantage. The apparatus is entirely automatic, coming into operation only when there is liquid to be raised.

Masters and Men.

The Men at the Jarrow Cement Works are out on strike.

National Federation of Building Trades.—The annual meeting of the Midland Centre of the National Building Trades Employers' Federation was held last week at Birmingham under the presidency of County Alderman Bowen. In their report the executive board congratulated the members on the continued prosperity of the building trade in the Midlands, and after referring to the various meetings held during the last year and nine months in the area covered by the centre, made reference to the dispute in the early part of last year with the operative plasterers. Notwithstanding the signing of the agreement of May, 1899, differences continued to exist in several localities between the employers and the operative plasterers, and the efforts of the council of the National Association of Master Builders of Great Britain and Ireland to arrange a conference with a view to the settlement of the same had so far failed. The report further stated that since August last several new associations of employers in the building trades in the Midland area had been formed and affiliated with the Federation. The attention of the employers was directed to the movement in existence for the general federation of the various trades unions throughout the country, by which combination it might fairly be assumed the organised operatives would secure increased power to enforce their demands. In order that the employers might be in a position to effectively deal with aggressive action or unreasonable demands backed up by the trades unions, the executive urged upon al master builders and employers in the several branches of the trade the necessity for being combined in a national federation. The National Federation existed not for aggressive action, but for the protection and promotion of the common interests of the employers and the general welfare of the building trade. The report and statement of accounts were carried unanimously, and Mr. James Wright (Nottingham) was elected president for the ensuing year. The following officers were also elected: vice-presidents, Messrs A. Chambers (Leicester) and John J. Moffat (Birmingham); treasurer, H. Willcock (Wolverhampton); auditors, J. Sharman Wood (Worcester) and J. V. Porter (Derby). A deputation from the National Association of Master Plasterers waited upon the meeting for the purpose of asking the Midland centre of the federation to make an effort to settle the plasterers' dispute at Nottingham. This matter was discussed at considerable length, and it was decided to arrange a conference with the view of securing an amicable settlement.

Federation of Trade Unions.—A meeting of the Council of the General Federation of Trade Unions was held at Birmingham last Friday. Mr. Pete Curran presided, and there were about fifty delegates present, representing 380,000 members of trade societies. Amongst those represented were:—The Perseverance Carpenters and Joiners (451 members); Electrical Trades Union (880); Amalgamated Society of Engineers (85,121); Amalgamated Society of Gasworkers, Brickworkers and General Labourers (4,009); National Plate Glass Bevellers (551); National Amalgamated Labourers' Union (3,561); Navvies, Bricklayers and General Labourers' Union (3,221); Amalgamated House Decorators and Painters (4,397); and National Stove-grate Workers (1,415). The chairman, in welcoming the delegates to Birmingham, said they were assembled to endeavour to bring about a consolidation of labour forces which would ultimately abolish or, to a great extent, minimise industrial warfare. Since the Federation was inaugurated in July last year it had made rapid progress, and it now included over fifty societies, amongst them some of the largest in the country. At present they were engaged in interviewing the executives of a number of other societies which had not joined them, and the reports to hand were of a very satisfactory character. They thought that the majority of the organisations would join the federation. They did not believe that the establishment of the federation could in any way portend labour wars, but that consolidation would bring about more conciliatory methods of settling industrial problems than the use of that very injurious weapon the strike. They wanted to make it clear to the commercial as well as the industrial world that their object in federating was to meet employers in general on a common basis. A few days ago a meeting of the employers in the building trade was held in the city, and the chairman announced that it would be necessary for them to federate nationally, in order to meet the united forces of the operatives' federation. They wished them good luck, believing that if both bodies met on the common federation basis great questions would be better settled than they would be if action were taken in the sectional or isolated way which had been characteristic of the past.—The Secretary, Mr. I. Mitchell, announced that six months ago they started with forty-four societies and a membership of 340,000. Now they had fifty-two societies (two having just joined them) and a membership of 380,000. The balance in the bank was £8,000.—The delegates then proceeded to the business on the agenda, which had reference principally to the mapping out of the Kingdom into provincial centres, and the general questions of devolution arising thereon. The centres adopted for the various districts were London, Bristol, Birmingham, Manchester, Leeds, Newcastle, Glasgow and Belfast, the meetings to be movable at the discretion of the management committee. The management committee was instructed to proceed with the formation of district committees forthwith.

Aberdeen Painters' Wages.—The Aberdeen Master Painters' Association are making efforts to abolish the standard rate of wages clause in the rules of agreement with the operatives. They have written to the Secretary of the Painters' Union intimating their requirements in this matter, and also in regard to the definition of "country money," which, they say, should only take effect when the workmen proceed beyond the suburban area.

Workmen's Trains in Lancashire.—The Lancashire Federation of Trades and Labour Councils, which includes Bolton, Bury, Preston, Leigh, Manchester, Oldham, Wigan, Rochdale, Warrington, Burnley and other councils, are taking up the inadequacy of the railway companies' provision of cheap trains for workmen. The matter will be discussed at a conference of delegates in Manchester next Saturday, and, should the representations now being made to different railway companies fail, a huge petition to Parliament will be promoted. It is contended that the service of workmen's trains, particularly in Lancashire, is deficient, and that the accommodation is often very unsatisfactory.

Builders' Notes.

For stealing tools value 12s., a bricklayer's labourer was last week committed at Clay Cross Petty Sessions to one month's imprisonment.

Mr. Joseph Milburn, J.P., of Whitley and Marlborough, Wilts., died last week. He was the patentee and manufacturer of Milburn's noiseless revolving chimney cowl.

A Warning to Painters.—On Wednesday last, in a County Court action at Westminster, a Mr. Hunton claimed £40 for damage done to his face and clothes through the fall of a paint pot from a ladder. The court awarded him £15.

A Huge Cement Combine.—It is stated that a very important combination of cement manufacturers is in process of arrangement, and a company is being formed in connection with it. The capital is to be £9,000,000, of which a large part will be offered for public subscription.

Messrs. J. Mensaque and Brothers, encaustic and glazed tile manufacturers, who have works at Seville, Spain, inform us that they have opened an office and show room at 14, St. Mary Axe, E.C., where their Moorish tiles—exact copies of those in the Alhambra at Grenada, the Alcazar at Seville, and the Mosque at Corboda—may be inspected.

A Good Clock for Workmen.—Owing to the plea made by a number of late workmen that they could not hear the clock strike one, at the end of the dinner hour, the trustees of the Duke of Bridgwater have given an order for a large turret clock to be placed on their offices at Walkden. When one o'clock comes round the clock will strike thirteen times.

New Bridge over the Kelvin at Glasgow.—On Wednesday last the memorial stone was laid of the bridge now being constructed across the river Kelvin, at Kirklee Railway Station, a short distance above the Botanic Gardens, Glasgow. Mr. Forman, C.E., has designed a bridge which has an elliptical arch with a span of 80ft. and a rise of 31ft. 9in.; the soffit of the arch will rise 36ft. above the bed of the river. The main arch will be flanked by two semi-circular arches of 18ft. span, supporting the approach roads, and affording openings for ornamental walks to be formed on both sides of the river in connection with the Botanic Gardens. The masonry of the bridge is of Dumfries red sandstone, with polished granite columns in the balustrade. The roadway will be about 50ft. wide.

Old Bricks.—A collection of Chaldean bricks has just been exhibited by M. Heuzey, of the Louvre, to the French Académie des Inscriptions. The earliest were rudely shaped, evidently made without a mould, and had their upper faces arched, each brick marked by way of stamp by the impress of the maker's thumb. These, which were found in some quantity in the very lowest strata excavated at Telloh and Nippur, are considerably over 8,000 years old. Next to them came the bricks made for the city of Sirpula, bearing the ancient cognizance of that city—an eagle with a lion's head. And so we go through the stamped and dated bricks of kings like Eannadu, who reigned in Babylonia some four thousand years before our era, to the beautifully painted and glazed ones found by Layard on the site of ancient Babylon.

New Stone-Cutting Machinery.—A diamond saw for cutting stone has been patented by Mr. George Anderson, Taymouth Engineering Works, Carnoustie, and there is now one at work in the establishment of Councillor James Stewart, quarrymaster and builder, at Grantsbank, Dumfermline. Hitherto a great drawback in connection with diamond saws has been the cost involved by the losing of the diamonds, but Mr. Anderson has devised a means by which the precious stones are prevented from dropping out. The principle adopted is that of fixing by electricity. The diamonds are dropped into small holes bored into steel sockets, and the sockets are then placed into an electric welding machine, with the result that the diamonds have a compact mass of metal sealed around them. The saw is 5ft. in diameter, and in its periphery 126 sockets are inserted at intervals of 1½in., 42 being in the centre and 42 at each side. At a recent test, the saw made 560 revolutions per minute, and on two occasions it cut a stone 4ft. 8in. long in eleven minutes, this being at the rate of a little more than 5in. per minute; but a much higher speed can be developed.

A Mart for Inventions.—The International Patentees' Exchange and Mart., Ltd., 1900, has been formed with the following main objects: To provide a central exchange for inventors; to afford them a permanent exhibition and sale rooms; to assist them in making their articles known to the trades interested and to the public; to expedite sales by bringing inventors and purchasers together; and to establish a laboratory, with qualified experts, and to provide motive power for demonstrating the efficiency of all kinds of patents. For exhibiting any article for twelve months, £1 per sq. ft. will be charged, and for an illustration in the syndicate's monthly magazine, with subject matter, the charge is £1 1s. Ten per cent. will be charged to the inventor when any sale is made by the Exchange; fees for demonstrating by motive power, or otherwise, the capabilities of inventions to be arranged. Premises comprising 20,000ft. super. have been provided at 142-146, Old Street, London, E.C., where all communications may be addressed. The exhibition will be free to the public (except Wednesdays, which day is reserved for members and exhibitors only) and will be run entirely upon commercial lines for the assistance of inventors.

Can Fire Hydrants be used for Ordinary Purposes?—On Friday last, in the High Court of Justice, the special case of the London County Council v. the East London Waterworks Company was heard. The questions for the opinion of the Court were:—(1) Whether hydrants, fire-plugs, and apparatus provided by the defendants pursuant to section 32 of the Metropolitan Fire Brigade Act, 1865, and (or) section 34 of the Metropolis Water Act, 1871, might, in the absence of any agreement under the London County Council (General Powers) Act, 1894, lawfully be used for any purpose other than supplying water for extinguishing fires. And if the Court should answer the preceding question in the affirmative (2) whether such additional user was limited to the purposes specified in section 37 of the Waterworks Clauses Act, 1847, or to any other purposes; (3) whether such additional user might take place without the consent of the London Council; (4) whether such right of user was confined to the defendants themselves, or might with their permission be exercised by other persons. Mr. Justice Bruce said that he was clearly of opinion that the first of the questions ought to be answered in the affirmative. With regard to the others his Lordship answered (2) in the negative, (3) in the affirmative, and (4) in the negative. Mr. Justice Phillimore concurred.

Building at Whitby has been fairly brisk during the past year and bids fair to continue this year. Extensive alterations and additions have been made to the Hotel Metropole; a new bank for the York Union Banking Company is nearing completion (Mr. Gwyther, of London, is the architect); a large block comprising some shops and a boarding house has been built in the main street from the designs of Mr. E. H. Smales; and there is a parish room in course of erection. A large hydro. establishment containing 120 bedrooms will shortly be commenced on the sea front. The Town Council are providing new lavatory accommodation and shelters near the Marine Parade, and are laying out pleasure grounds on the Khyber Pass. A great many shop front alterations have recently been made. Several villas have been and are being built on land near the sea with half-timbered and stucco fronts from designs by Mr. G. S. French, architect; also, in the Avenue, some are being erected from designs by Mr. Henry Walker, architect; villas are also being built in many other parts of the town, and at Robin Hood's Bay. At Sleights some bungalows and small villas have been erected from plans by Mr. G. S. French, Messrs. Clark and Moscrop, of Darlington, and Mr. Milligan; while at Sandsend, near Whitby, a large hotel is being built on the esplanade, and bungalows on land belonging to Lord Normanby. Amongst other works to be commenced shortly are a cottage hospital, an electric light station, a new bridge over the river, and a Methodist church.

Engineering Notes.

New Waterworks for Llanelly.—For the construction of additional waterworks at Llanelly the tender of Mr. Lewis P. Nott, the contractor for the new dock now in the course of construction, has been accepted. It was the lowest.

The new Tugela Bridge, in the construction of which the Patent Shaft and Axletree Company, Ltd., of Wednesday, have made a world's record, is 105ft. long and 16ft. 6in. wide, weighing about 750 tons. Though built from special and not from stock designs, the bridge has only taken three weeks to complete.

Millbay Station, Plymouth, is being enlarged. The work was commenced two years ago, and everything is expected to be completed in eighteen months' time. The cost to the Great Western Railway Company will probably be £70,000. The railroad has been widened to from 80ft. to 90ft. and an additional platform has been provided. Local stone, with Portland stone dressings and bands of Torquay red stone, will be used for the station buildings. Mr. W. T. Jinkin is the contractor, but the Company are doing some of the work themselves.

Electricity for the London District Railway.—The District Railway Company has deposited a Bill for next Session asking for powers to construct a generating station at Chelsea in furtherance of the scheme for working the line by electricity. The company also asks for leave to work by electricity on its own lines, and on the lines of the Metropolitan Company over which the District has running powers. Provision is sought for the mutual supply of electricity, under agreement, between the Metropolitan, the District, and the Brompton and Piccadilly Circus Railway Companies.

A Tramway Power Station at Ringsend, Dublin, has been built for the Dublin United Tramways Company; it is said to be the largest of its kind in Europe or America. Two chimneys, 220ft high, have been erected on a base 28ft. high, built on concrete blocks, the brick lining of the chimneys being 10ft. in diameter. The boiler and engine houses are each 83ft. high from the lowest floor to the apex of the roof, while the main building has a width of 80ft. inside, with a steel roof in a single span of 200ft. The roofing is of terra-cotta tiles, with a strong slating on top. The coal tower is one of the features of the station; its machinery was furnished by Messrs. C. W. Hunt and Co., of New York. The equipment and arrangement of the Ringsend power station has now enabled the Tramways Company to operate over a hundred miles of street railway track. Mr. Bryden is the local representative of the consulting engineer, Mr. Parshall, of London. About 200 cars are now at work in the city and suburbs.

Leeds Association of Engineers. — The members of the Leeds Association of Engineers paid a visit the other evening to the Leeds Corporation Gasworks at New Wortley. After passing through the retort house, worked by hand, the visitors were shown two methods of stoking by machinery—namely, the West's compressed air and the Arrol-Foulis hydraulic systems, both of which afforded much interest. These machines draw and charge 450 through retorts five times every twenty-four hours, and are manipulated with ease by the machine men.

Incandescent Lighting: An Appeal Case.—In the appeal case of the Welsbach Incandescent Gaslight Company v. The New Sunlight Incandescent Company, action was brought to restrain an alleged infringement by the defendant company of the plaintiffs' patent of 1893. The defendants alleged that before the date of the patent the plaintiffs' predecessors in business, the Incandescent Gas Light Company (who in 1897 transferred the patent and their business to the plaintiff company, which was formed by way of reconstruction of the old company) had manufactured and sold the alleged invention, so that the patent would be invalid. The Court, on January 17th, dismissed the appeal, but ordered that the costs should be costs in the action.

Surveying and Sanitary Notes.

St. James's Church, Muswell Hill, N., is proposed to be removed and rebuilt, using as much of the old material as possible. It will also be enlarged, the cost of the work being estimated at £13,000.

Public Improvements at Matlock Bath.—On Wednesday a Local Government Board inquiry was held at the Town Hall into an application by the Urban District Council for powers to borrow £900 for purposes of public walks and pleasure grounds, and also for a new street.

Extensions at Aberystwith.—The Corporation propose to spend £12,723 in extending the marine promenade in front of the University College of Wales, and round the Castle point to South Terrace, and to build workmen's dwellings on a site adjacent to the Smithfield, at a cost of £3,200. A Local Government Board inquiry has been held.

Sir Richard Thorne's Successor.—The president of the Local Government Board has appointed Mr. William Henry Power, F.R.S., medical officer to the Board, in place of the late Sir Richard Thorne, K.C.B. Dr. H. Franklin Parsons and Dr. R. Bruce Low have been appointed assistant medical officers.

Drainage Scheme for Crofton, Wakefield.—Mr. R. H. Bicknell, an inspector of the Local Government Board, conducted an inquiry on Friday last into the application of the Rural District Council for power to borrow £6,000 for drainage purposes at Crofton and New Crofton, the repayment to extend over thirty years.

Sewage Works at Hindley Green, Wigan.—New sewage works at Hindley Green were opened on Wednesday last. The work has been carried out by Messrs. Brown, Phillips and Co., contractors, under the direction of Mr. A. Holden, the engineer and surveyor to the District Council, and comprises a sewage receiving well, 30ft. by 15ft. by 10ft. deep, sludge well, 20ft. by 10ft. by 10ft. deep; four settling tanks, each 40ft. by 20ft. by 6ft. deep; four artificial (coke breeze) filters, each 20ft. by 12ft. by 3ft. 4in. deep; inlet channel, sludge lagoon, screening chamber, engine house and store room, gas engine, and four pumps each capable of lifting 15,000 gallons 21ft. high per hour. The whole of the sewage requires pumping, but flows by gravitation to the works. The estimated cost of the works was £5,249, and the actual expenditure has been £5,056 14s. 6d. The system adopted is that of chemical precipitation in tanks, and filtration through artificial coke breeze filters. The effluent resulting is expected to satisfy the requirements of the river authorities.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.

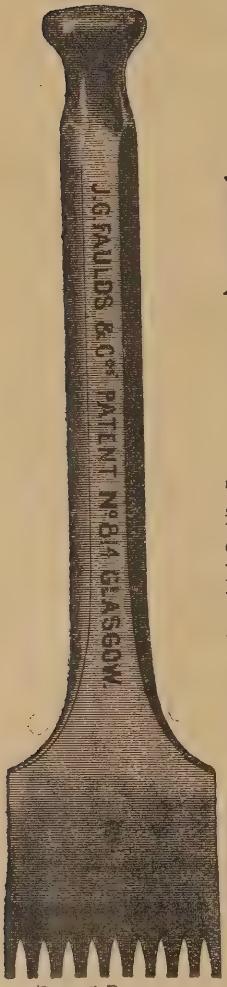
TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.

J. G. FAULDS'

IMPROVED

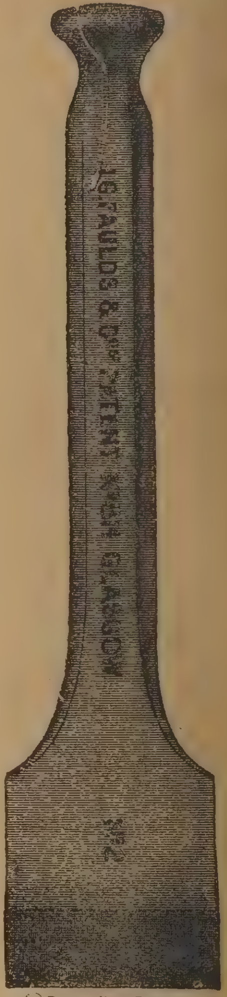
Multiplex Stone-Cutter.

Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.



J.G. FAULDS & Co's PATENT No 814 GLASGOW.

Drove, showing Cutter in Slot.



J.G. FAULDS & Co's PATENT No 814 GLASGOW.

Reversible Cutter, with "Drove" Edge out.

THESE IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

SOLE INVENTORS, PATENTEES, AND MANUFACTURERS—

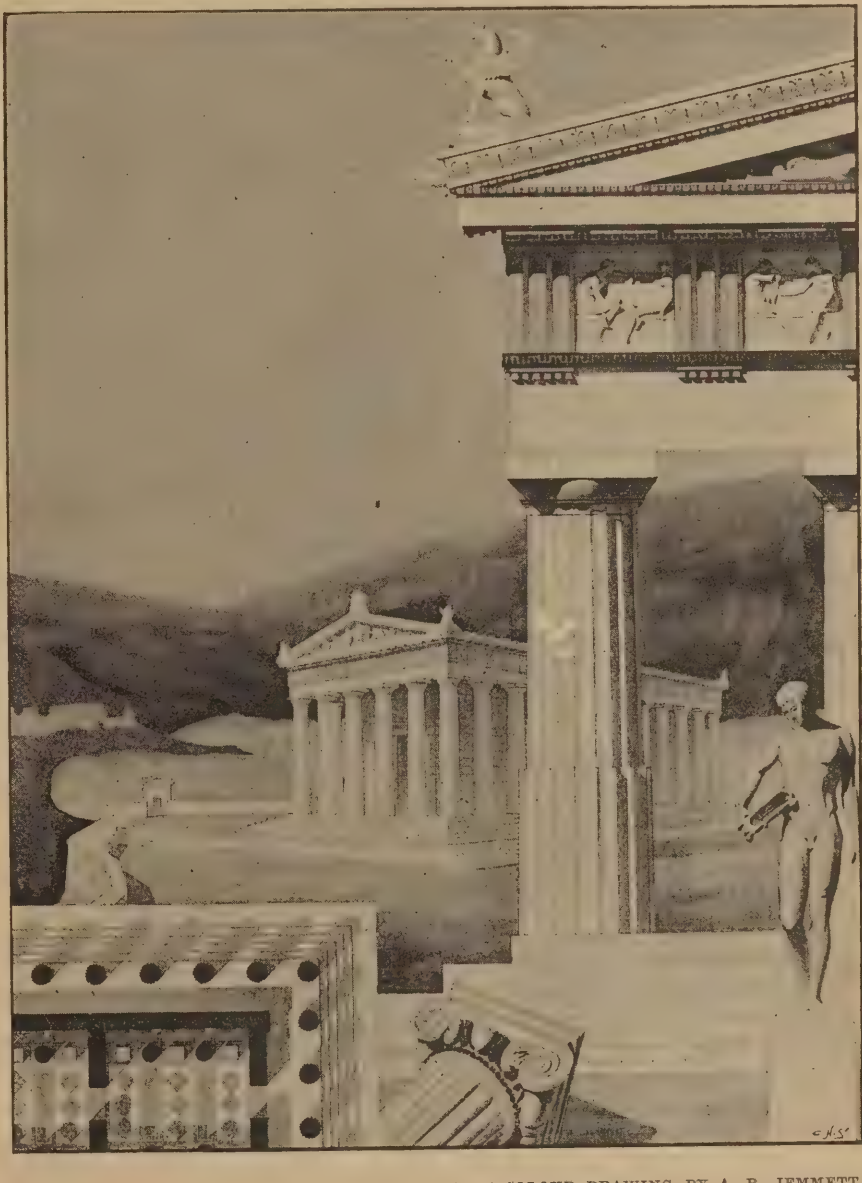
An Architectural Causerie.

Signs of the Times. THERE are works in progress at the French Embassy, by Albert Gate—works which have for their object the enlargement of that huge and, exteriorly at least, ugly mansion, which was the first of the millionaires' palaces in London. These works have caused some alterations at Knightsbridge, by which one of the most singular sights in London has become imperilled, even if not to be destroyed: that curious sight, always pointed out to country cousins, of a church standing between two public-houses. This by the way; for we are not especially concerned with this extraordinary juxtaposition of Beer and Bible. It is the change at the Embassy and the memories it recalls which concern us, for in the works in progress here we find eloquent testimony of the growth during half a century of wealth and ostentation. To go back to the time when the building, which is now the French Embassy, was erected in 1845, is to be removed to quite another world. Albert Gate was formed then, and the two great mansions built which flank it. They grew to completion amid the wonderment of Londoners in general and the satire of the wits in particular. They were considered so huge that the possibility of their ever being occupied was scouted in the nickname they earned. The "Two Gibraltars" they were called, because, said those satirists, they could never be taken. One, however, was taken and that speedily. Hudson, the ex-draper and "Railway King," installed himself there, the millionaire of the moment; the other, less fortunate, was divided up and let in that way. It is now, however, in the occupation of one person. Hudson did not last long; like many another among our home-bred millionaires, or reputed as such, he could not retain the wealth he had amassed. The soil of England is not favourable to these monstrous growths which spring up suddenly here, and, like Jonah's gourd, vanish as swiftly. Hudson's crash was sudden and complete, and the Great Northern Railway Company came into possession of the mansion. Probably if the French Government had not taken it over, the Man in the Street would have been justified of his satire, and the place have remained unlet, for those were the days before modern Nabobs, whether of Emma Mine fame, whether Nitrate Kings, Diamond Kings, or the like, had come into existence, and the upkeep of such an establishment would have been prohibitive to ordinarily wealthy purses. Perhaps the first mansion to be built in London for one of the millionaire breed was the long-vanished "Kensington House" for the recently dead Baron Albert Grant. Mr. James Knowles, who also designed Tennyson's house at Aldworth, was the architect of it, and you may see the elevation duly set forth in the professional papers of that period, about 1873. Not that it is worth looking up, save for curiosity, for it exhibits the worst vices of the French taste of the period, and, like the Gothic house at Aldworth which has a Mansard roof, is utterly indefensible.

The point with us at present, however, is that when Grant failed no one was found wealthy enough to risk taking the great vulgar palace built for him and never occupied from the day of its completion to that of its demolition. Far otherwise, with the continual growth of wealth, would it be to-day, when every mushroom plutocrat builds a mansion in Park Lane or in some other equally famous spot. Only, a curious fatality seems to impend over those of the new rich, who build for themselves these lordly pleasure-houses. Barnato had not quite seen the completion of his flamboyant mansion before his end came, and "Colonel" North, who indeed did not build in town, but at Avery Hill, Eltham, died—and *not* the millionaire he had been—shortly after he removed into that palatial residence. But these more recent houses, as ornate as and larger than those of a generation ago which could not find tenants, are soon peopled again when they are to let. For the standard of living is rising, and wealth is growing, and no mansion in town is large enough nowadays to be dubbed a "Gibraltar" for the reason that the French Embassy was originally so named more than fifty years since. C. G. H.

Vandyck and Rubens. THERE is magic in dates if they are rightly assorted, and to those who regard art history as but part of the world's history the significance of Rubens' birthday in the year 1577 should not be overlooked. His pupil Vandyck saw the light in 1599, and Velasquez in the same year.



STUDY FOR A GRECIAN TEMPLE. FROM A WATER-COLOUR DRAWING BY A. R. JEMMETT.
(*See Page* 401).

Whilst the paintings at Burlington House are attracting so much attention the works of his master should not be forgotten, and those at present on view at the New Gallery are particularly worthy of notice. The most splendid, perhaps, is a "Moonlight Scene," which might be chosen to illustrate the first chapter of a Complete History of Landscape Painting, and which either Hobbema or Van der Near may have studied.

We spoke in a recent article of the earlier works of the Flemings, and may be allowed to continue where we left off. It was said that with the substitution of canvas for wood a new epoch of art commences, for, judging of what meets the eye in modern work one would say that painting in oils upn canvass must be reckoned a plastic art, the media being so much in evidence that we hear more about the executant's mastery than about the subject or anything else. One may feel as little respect as Voltaire for Philip IV. of Spain, and yet look with delight on the portraits Velasquez painted; and the same may be said with a difference of the English king and his court.

To Vandyck, among painters of portraits, must the palm be given? A portrait to one who can paint comes as naturally into the day's work as anything else that turns up, and there was hardly a painter amongst the old masters who did not produce some unsurpassable work of this kind. It may happen, of course, that portraiture becomes a mere business as soon as the talent is recognised. Take Millais, for instance. He was as regularly at work in his studio during his most prosperous years as a solicitor's clerk in an office. Nine months in London. Three months in Scotland, where most of his landscapes were painted. How much of such work was perfunctory, containing only as much of Millais as the patron may claim as his due, and how much of the Vandykes here? Whatever opinion he forms of this artist, the outsider need not be ashamed of it. If he says he sees nothing, then clearly he wants some help; if on the other hand that not more than a third seem to deserve more than a passing glance, and of the best that only some parts can be praised, he will, after saying all this, be entered in my good books as one who knows a good thing when he sees it, whatever it happens to be. Even I, who am expected to know more than I possibly can, may plead, excusing my ignorance, that out of one thousand Vandycks only fifteen are signed, and as for the remainder the consequence of this uncertainty is that there is a good deal of guesswork for critics, and some very painful experiences, for no sooner have marks of approval been set against the number of some supreme work than the "expert" happens along, leaving us of the same opinion as to its excellence, but depriving us of all the pleasure we had in thinking we knew a good Vandyck.

Now what of the style of these paintings, for it was that after all which determined the character of English portraiture until Reynolds and Gainsborough came. We see it depraved in the hands of Peter Lely, and Kneller, but in Gainsborough's sweetest portraits is the essence of Vandyck's style. The portraits themselves, inasmuch as they illustrate history, will always retain their value, and from this point of view the poorest may be the most interesting. The fat hand with its tapering fingers outspread, as useless as it is showy, may be thought to betoken the imbecility of its possessor, but this was not the painter's intention we know, nor the noble sitter's idea. The right leg like a Doric column, the left like a weeping willow—it may seem that there is nothing in Nature or art more futile and silly than the type preserved by Vandyck. But happily there are not a few exceptions to this very general rule, and amongst the world's wonders may be reckoned the best Vandycks.

Less potent in England, perhaps, because of Vandyck's establishment here, has been the influence of Rubens. His talent, applied indifferently to everything luscious and opulent within the domain of art, was exactly what the world wanted, and in France under Louis XIV. his influence must have been enormous. There is the perfection of composition and everything else in the laughably animalistic pseudo-classical scenes, of which drawings are shown in this gallery. We can trace to this source the guileless debauches of Ettz, whose once popular "tea trays" are only purified copies of Rubens.

ERNEST RADFORD.

On Reflection.

Registration Ridiculed. "A TRADE UNION of a distinctly vicious and mischievous type;" that is what, according to the "Liberty Review," the architectural profession will be if compulsory registration becomes law. We do not suppose our contemporary would apply such a description to the medical profession, or that it would advocate the throwing open of that profession to every quack who chooses to trade upon the gullibility of the public; yet, to be logical, it ought to do so. The demand for legal registration is simply a demand that the architectural profession shall be closed—as the medical profession has long been closed—against all who cannot give evidence of a certain standard of efficiency. This, the advocates of registration maintain, would have the two-fold advantage of protecting the public and raising the status of the profession. Continuing our analogy, we presume no one will deny that the medical man of to-day stands far higher in public estimation—and rightly so—than did the barber-surgeon of an earlier day who displayed a bowl of blood in his shop window as the symbol of his trade. It is beside the mark to point out, as our contemporary does, that many old houses were well built and beautiful, and that we have often no record of the names of the architects who built them, or of those who built the Gothic cathedrals. Registration is a modern remedy for a modern evil. But, of course, the "Liberty Review" cannot see the matter in this light; having a fixed idea that every addition—no matter what—to the functions of the State is an evil to be opposed as an attack upon individual liberty, it naturally misses the point of the agitation for registration, and pours scorn upon the idea of "architects by Act of Parliament."

Wanted, a Cheap Architect. IF anyone thinks that the status of architects is what it ought to be, let him peruse the following advertisement, which appeared the other day in a Welsh newspaper:—

TO ARCHITECTS.

THE TOWYN AND PENNAL SCHOOL BOARD offer a prize of £3 3s. for the best plans and specifications of Infants' School at Towyn, with accommodation for 120 infants, with offices, boundary walls, entrance gates, &c., cost not to exceed £500. The winning plans and specifications to be the absolute property of the Board. The Board do not bind themselves to accept the best nor any plan. The competitors are to state their terms for superintending the carrying out of the works, and for furnishing working drawings, full particulars, &c. Sealed plans and specifications to be sent, &c.

No doubt the members of the Towyn and Pennal School Board are estimable members of society, but is it not obvious that they must have a very low estimate of the dignity of the architectural profession? We dare say there will be plenty of competitors for the three guineas, and that the School Board will succeed in finding a very cheap architect. We do not blame them; they no doubt know the architectural market in Merionethshire better than we do, and we quote their advertisement simply as evidence of the depths to which a profession unrecognised by the State may fall.

Municipal Shortsightedness. IT is interesting to note what slow progress the advocates of large municipal enterprises make with the general body of the population concerned. In one place, a new town hall causes dispute, or perhaps the site for a new town hall; in another, the purchase of an open space for the public; in another, a scheme for electric lighting, or the erection of public baths; but the opposition to all these schemes has generally the same common cause, the fear of an increased rate. Householders have, naturally, a great horror of a large rate bill. But the matter of expenditure should not invariably overrule all other considerations. Here is a case in point. According to precedent, the good people at Portsmouth have long been discussing whether they should or should not build a technical institute for the advancement of the younger generation. At the back of the town hall there is a piece of ground known as the Mayor's Lawn, which, when the building was erected, was specially reserved in order to set off the architecture. This was a very good idea, but it is now to be set aside, for, by a majority of four, the Council have decided to build the technical institute on the spot. The admirers of the town hall have been pleading that such a course would be a desecration and a vandalism; besides which, they say, to put up a building in harmony with the town hall would entail an expenditure for extras equal to that which would be incurred in building on one of the eighteen other sites suggested. Of these sites, some had been declared to be too small, and some unsuitable in other ways; but the Council's committee decided this detail. Anyhow, it looks as if the technical institute is to be built by the side of the town hall, and that it will appear out of place there. Mistakes of this kind have their counterpart in almost every town, and they are continually being repeated. The provision of open spaces in front of large buildings, especially public buildings, is not considered half enough, and in a matter of this kind those in charge should be allowed a free hand, and not be hampered by a niggardliness which is made more prominent by silly extravagance in other directions.

Amateur Builders. THERE has just been opened at Bristol a Baptist Chapel, which has been erected in a somewhat novel manner. The congregation of the Victoria Park Baptist Church, wishing to add a new wing to their building, and not having the wherewithal to pay for the work, determined to do it themselves. Accordingly a number of what might be called "building picnics" were organised for Saturday afternoons, and, under the direction of certain expert members of the congregation, the whole of the work, with the exception of the bricklaying and plastering, was completed without costing a single penny for labour. There is something very admirable about the spirit and enthusiasm of these amateur builders, and specially pleasant is it to notice that a local contractor, so far from being filled with anger at the loss of a possible commission, made a present to the church of the stone used in the foundations. It is impossible, however, not to reflect upon the possible dangers of any considerable extension of this kind of thing. The jerry-built house we know, and even the jerry-built church, but how much better—one is inclined to ask—is the amateur-built house or church likely to be? To build badly because, with the best intentions in the world, one cannot build well is no doubt morally a less reprehensible proceeding than to build badly of set purpose with a view to pecuniary gain, but practically the results of the two things are the same. In the erection of any considerable structure it must not be forgotten that many highly skilled industries are engaged, and it is not to be expected that the zeal of the amateur will make up for the hard-earned skill of the experienced artisan. In making these remarks we are not reflecting upon the Victoria Park Baptist Chapel, which may, for aught we know, be a model of constructive excellence, but are simply pointing out a rather obvious danger attaching to experiments of this kind.

The Study of the Human Form and its Influence on Architecture.—III.

By A. R. JEMMETT.

(Concluded from page 367, No. CCLVIII.)

It is hardly possible to doubt that the study of the human form has had a certain influence on the architecture of the past, particularly on that of the Greeks, and so indirectly on all that which followed it. Vitruvius devotes a chapter to discussing the proportion of the human body, and suggests that the Greeks discovered in it certain definite proportions, which they applied to determine those of their temples. Viollet-le-Duc, commenting on this passage, considers there is more truth in its spirit than its letter, that instead of a metrical scale they more probably discovered a method; that they regarded man as the ideal of structure, and so endeavoured to design their buildings on the same principle.

Familiar as the architects of those days must have been with the human form in its highest development; when the undraped figure was continually before their eyes; when physical beauty was a popular cult, and wives made offerings to the gods for beautiful children; it would, indeed, be interesting to know how much of their exquisite sense of form and unerring taste was due to this familiarity. Perhaps we shall never rival them in these respects until we have equal opportunities, and take the same frank and wholesome delight in the beauty of the human form.

A TWELVE HOURS STUDY. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

It seems evident, also, that there were current among their philosophers many ideas not generally accepted now as to the inward and mystic significance of the human body, such as that of the macrocosm and the microcosm, and such ideas may have had a certain influence on the architects. Perhaps we shall never know their precise effect, or the full extent of the general influence of this study, but the evidence points to the conclusion that it was considerable, and suggests that we shall never arrive at a just appreciation of their architecture unless we have a previous appreciation of the human form.

But if the Greeks knew all that was to be learnt by observation of the form from without, we have the added advantage of systematically observing it from within, of understanding better the functions of the organs and the effect they have on the outward form. We can know it better as a structure, an organism, and are in a position—thanks to the comparative anatomists—to compare it with other organisms. The application of this comparative method, both to the structures of Nature and to the architecture of the past, is, perhaps, the one great advantage we possess over the architects of antiquity.

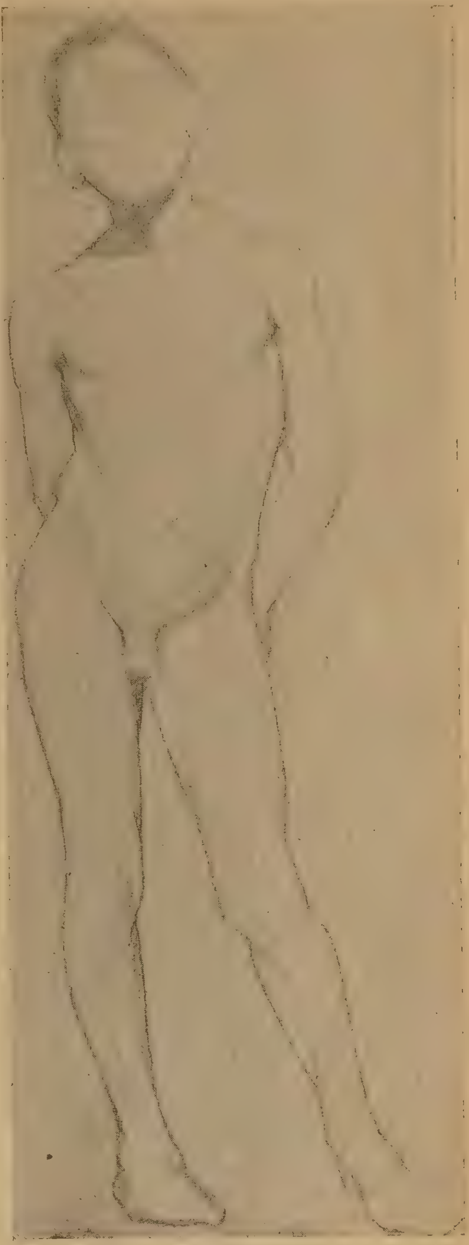
Let us then, for a moment, consider the human form as an organism, as a form which grows and develops in obedience to the creative force within itself; which is the natural and inevitable expression of that spark of the mysterious principle of life with which it had been endowed; which so presents a complete unity of conception, a separate and independent creation. For what else are the works of the architect but organisms also, which grow out of and express the living idea within, and present this same unity of conception? and what better precedent can be followed than their prototypes in Nature?

Now, if we apply the comparative method to the natural organic structures, we see why it is that man is the highest, and why his structure is the best precedent for us.

In every organism, from the highest to the lowest, we find a general law—that its structure shall tend to exactly express its functions, its needs, its nature, neither more nor less. In man, as the life is the highest and most complex, so too is the structure which expresses it. In simple organisms which fulfil one particular function, the characteristic form of the structure is adapted for that purpose, as that of the earthworm. In more complex organisms the form has to be equally adapted to several functions; but, some pressing need of existence often develops some organs out of proportion to the others, and so spoils the proportion of the form, as in the giraffe.

But in the more perfect ones we no longer find any one part developed at the expense of another—such as the vertebral column at the expense of arms and legs, as in the snake; or large hind legs at the expense of arms, as in the kangaroo—they are all more equally developed, and so the structure is more equally balanced.

Man seems to sum up in himself—to include, each in its due subordination—every faculty of the lower animals; in studying him we are studying all. Being endowed with reason, he no longer needs the special development of any organ. His nature, besides being the most complex, is thus the most equally developed, and the structure, which expresses his nature, is, therefore, the most equally developed also. It is the highest example of that beauty which is the result of perfect balance and proportion of parts, of the harmonious combination of many opposite qualities, the harmonious working together of many diverse functions. So that he presents a perfect model for the architect who has to balance the different parts of a large and complicated building; to give and take; to reconcile the conflicting interests of different departments; to keep every feature in due subordination to the rest; to provide for the fulfilment of every function, satisfy every need, and then to knit and weld the whole together into a beautiful organic structure.



A TWO HOURS STUDY. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

As in Nature, so in architecture, we find simple or complex organisms to perform simple or complex functions, to express a simple or a complex life. How simple is the organism of such buildings as a mortuary or a tithe barn. They fulfil but one simple function which suggests their characteristic forms; they express one simple phase of life and nothing more. How complex is the organism of a palace or a town hall, a hotel or a hospital. They fulfil many functions, express many phases of life. They have a centre of intelligence and administration which controls the whole body, means of rapid communication with every part, arteries through which the human life circulates, means for taking in everything necessary to their maintenance, and for passing away refuse. They might, without much exaggeration, be called the bodies of which man is the living spirit. When in daily use, and the tide of life ebbs and flows through their corridors and halls, they live and breathe; when shut up they sleep; when deserted they die, and, falling into decay, turn again to dust. Their existence, like that of a man, is for a limited time, but their memories, like his, may be immortal and influence generations yet unborn.

Who that has walked along the quay of the Seine, and watched across the water the vast grey mass of Nôtre Dame gradually unfolding its length and seeming to move as we pass, but must have been impressed by its organic unity of conception, and have felt a vague suggestion of some colossal and mysterious living creature sleeping midst the passion and tumult of the life around—a dreamless sleep of a thousand years. There, in the Isle of France, to the artist ever a sacred spot—a spark of the Promethean fire has descended; a germ, instinct with the mysterious principle of life, has developed into a glorious organic creation—expressing the faith of humanity and its unutterable longing for the face of the Unseen.

A TWO HOURS STUDY. FROM A CHARCOAL DRAWING BY A. R. JEMMETT.

To develop a parallel between the evolution of natural organic structures and of those recreated by the hand of man, to note the coincidences, to trace the common principles, were a fascinating inquiry, but impossible here. To take the human form alone and discuss it in detail, to suggest the various principles to be found therein—that all are alike in construction, all, so to speak, in the same style—infinite variations on one eternal theme; that the importance of every feature accords with the dignity of its function; that a feature is beautiful only in its right place;—were interesting and important, but beyond our scope. Besides, when we look for guiding principles of design, we shall probably see, each man for himself, that which appeals most to our own habits of thought, as much as each one of us is capable of seeing; but there is one point to which attention might be drawn, as having a distinct influence on our way of looking at things, on our ideals, our conception of architecture.

The more we know about the human form, the more we compare it with other structures, the more we see the universal tendency of Nature, that every feature shall have its structural, its physiological reason, shall exist only in the discharge of a function.

When we look, therefore, for the reason of the beauty of the figure, we can find nothing that has been introduced simply for the purpose of pleasing. Its beauty is not something added to an otherwise perfect structure, its beauty is the perfect structure; which structure is the result of its perfect organisation; the equal development, the harmonious working together of every faculty of human nature, physical, mental, and spiritual. Neither can we find any conscious effort to obtain beauty; it does not seem to be the primary object for which the structure was created. The real aim seems to be structural perfection, beauty to be the proof of this perfection; the beauty varying as the perfection of the structure.

There is, at the Museum of the College of Surgeons, a ghastly collection, which every architect should see, of imperfect human organisms and malformations; monstrosities at sight of which the natural man revolts. But why? Why do we instinctively turn from an eye in the centre of the forehead, or a leg in the centre of a stomach? As features, as limbs, they are as perfect as any other; yet should we not say that the man who admired them was unhealthy, unnatural? Why do they fill us with disgust? Is it that we—being so familiar with the natural, the normal structure — know instinctively that such features are in the wrong place, mean nothing, discharge no function, and destroy the organic unity of the whole; that the order of Nature has been interfered with; that the thing is unnatural; and is it not our nature to shrink from the unnatural?

If a perfect building can be compared to a perfect organism, to what can we compare those that have not this structural perfection, this organic unity, but to such monstrosities as these? And if we were as familiar with perfect models of architecture as with those of the human form, if our instinct was as true in the one case as the other, would they not fill us with the same disgust?

We are naturally led to ask how far such considerations apply to architecture, whether the same general organic tendency that is visible in Nature is visible there? Is the beauty of a building the result, the proof, of its structural, its organic perfection? Does its beauty vary as the degree of this perfection? Can a structure be perfect as a structure without being beautiful? It may be as perfect as reason can make it, but is it as perfect as it could be made, were enthusiasm and a passion for perfection added? Are the structures of the mechanician or the engineer perfect as structures? Do any one of their forms exactly express the necessities of the case, as we find them expressed in the human form? Is the precise form of a rolled iron joist, or a cast iron column, dictated by the strain upon it, or by convenience of manufacture; and, as two joists are rarely weighted exactly alike in practice, why are they made the same shape? Such forms are lifeless things, they tell us little of the strains to which they are subjected; but the bones of the human skeleton, or the trunk of a tree, are modelled to express the forces acting through them. They are, so to speak, evolved by the forces, the actual force itself materialised.

Is the lack of beauty in mechanical constructions to be attributed to this indifference to exact expression, this lack of feeling, of enthusiasm for perfection? Is not the difference between the artist and the mechanician, the architect and the engineer, this, that while the one reasons coldly, the other reasons at a white heat, and so gets a deeper imaginative insight, and produces a structure that more exactly expresses its nature; which is more beautiful because it is more perfect as a structure?

Should we then consciously strive after beauty? Is it not too elusive to be grasped in this way. Would it be better to aim, like Nature, at structural perfection, believing that beauty will be its ultimate reward, as happiness is said to be that of virtue?

If then we aim at this absolute perfection of organic structure which is to be seen in the works of Nature, can it be obtained without something of the gift of instinctive insight? But, on the other hand, is it safe to presume we have this gift, and to trust too much to our instincts?

No doubt we ourselves are works of Nature, and so, in a sense, it may be said that, inasmuch as the structures of birds or of insects are natural instinctive structures, so too are those of man. But this distinction must be drawn, that, whereas the brute creation blindly obeys the voice of Nature, and so builds by instinct perfect structures—is, as it were, a perfect medium through which the creative force of Nature can operate—to man has been granted free will, to obey, or not, as he pleases. Whereas a bee must build a perfect honeycomb, or a bird a perfect nest, because they cannot help it, man may build imperfectly and foolishly if he likes; and the point is, he generally does like. This privelege of making a fool of himself, of looking ridiculous, which distinguishes man above other animals, is one of which he is naturally proud. When he builds, he will surrender his reason without a murmur, ignore the existence of his moral sense, but this one privilege, his patent of nobility, he will defend with life itself.

STUDY OF A HEAD. FROM A CHARCOAL DRAWING BY A. E. JEMMETT.

A TWO HOURS STUDY. FROM A CHARCOAL DRAWING BY A. E. JEMMETT.

The instincts of a natural and perfect man would necessarily be perfect; doubtless he could always build instinctively and yet build truly; he would be, as it were, an instrument in the hand of Nature.

Carlyle, after quoting the dictum of Novalis that Shakespeare's dramas "are part of Nature, too, deep as Nature herself," remarks that "it is Nature's highest reward to a true, simple, great soul, that he gets thus to be a part of herself. Such a man's works, whatsoever he with utmost conscious exertion and forethought shall accomplish, grow up withal *unconsciously* from the unknown deeps in him—as the oak tree grows from the earth's bosom, as the mountains and waters shape themselves—with a symmetry grounded on Nature's own laws, conformable to all truth whatsoever." Might not this be an appreciation of some great master builder of the past, of ancient Greece or the Middle Age? Do not their creations grow? Are not they "grounded on Nature's own laws, conformable to all truth whatsoever"? And does not this remark help us to see why it is that Shakespeare's personality is not easily to be discovered in his works? A complete devotion to Nature leaves no thought for self. And when we come to consider the greatest achievements of architecture in this light, we see also how little they reflect the personal idiosyncrasies of their designers. Could we give an intelligent account of the individuality of Ictinus, as distinct from that of Callicrates, or any other contemporary architect? When we look at the Parthenon we forget to think of the architect, and so unconsciously pay him the highest possible compliment. And if we do attempt to look behind the art to the artist himself, do we discover anything but a tremendous intellect? If we look through the human form for Nature herself, do we see anything but an infinite power?

Does it not seem then that the more perfect the creation the less it betrays the creator's individuality; that the moment we perceive his individuality we perceive his limitations? Possibly the personality is there, but the main object of a building is not to advertise it.

The nature of the artist does, unfortunately, modify the conception that germinates in his mind; as the nature of the soil modifies the seed; as the nature of the parent modifies the offspring. But is this a thing to be proud of? When we see a perfect plant we do not think of the nature of the soil, we admire the plant; it is only when it is stunted or deformed that we have time or inclination to notice the poverty of the soil. So that in cultivating a distinct individuality, as is the fashion just now, we are only advertising our own limitations. Why cannot we be content to follow Nature? She does not go out of her way to produce crippled, twisted, and abnormal plants just to advertise the peculiar bad character of the soil in which they grew. Then why should we? If we must be original, let us be so by doing the thing that is artistically right; if we do this, we shall be original indeed.

It well may be that such conclusions as these are but fancies, which cannot be logically deduced from the human form; and if they can, it well may be they are beside the mark. But the truth is a diamond of many facets; from any point of view surely we can, if we will, catch at least a glint of its light. And though we are all too prone to see things as we wish to see them, to clip and trim the "Garment of God" to the size and shape of our own little theories; yet, if we do bring away from such a study as this misconceptions of what we have seen and felt, at least we have learnt how great is Nature, how insignificant are our own personalities.

PRIZE DESIGNS AT THE R.I.B.A.

A GRATIFYING feature of this year's competition is the good choice of subjects given for the principal designs. The Soane is an Art School situated in a park, and the Tite is an isolated clock tower and belfry. These programmes give the student a free hand, and save him the needless and irritating restrictions imposed by the bad sites and L.C.C. regulations that have usually been in force both at the R.I.B.A. and at the Academy.

A protest against deformed sites and arbitrary restrictions of all kinds has been made in this journal year after year. It is to be hoped that the Institute, having at last got rid of them, will never return to them, but will give the students a chance to produce, for once in their lives at least, complete architectural conceptions. Might one be permitted to suggest, as a further improvement, that in all such subjects as "A School of Art in a Public Park," a small scale plan be required of the immediate surroundings, and the laying out of the approaches, &c., as this is of as much importance as the building itself, and makes the scheme more complete?

With regard to the drawings submitted for these two prizes; the general impression is that there is great lack of characteristic design, presumably the result of want of thought or knowledge, and right method in designing. We find windows and doors, statuary and colonades, from Italian palaces and English churches of the seventeenth century, put into a school of art or a clock tower, without any regard to their meaning or fitness. This destroys all true artistic expression, and robs the designs of their interest and charm.

In the competition for the Tite Prize, the first place is awarded to Mr. Percy E. Nobbs, who has a practical, workable sort of design,

G G G

well thought out, and illustrated by good drawings. The perspective has a good atmospheric effect, although the lower part of the tower seems a little out of tone with the upper part, and has perhaps too much work in it. Indeed, as a design, this tower strikes one as being in two different pieces, one above the clock and one below. The upper part might have been taken from a church of the Hawksmoor or Gibbs type, and there seems to have been no attempt to express characteristically just the definite features of the programme and nothing else. This design might have been improved by more of a base, to start it from the ground; it looks just a little as if it was a church spire cut off and stuck in the pavement. There is some nice carving in the detail, and the figures are good in intention and drawn in with some spirit. It is necessary, however, to take exception to the festoon hanging from the keystone, across the voussoirs of the arch, with the arch joints running through it. Of course, we have often seen it done, but it is not right, and it is not beautiful, and there is no need to go on repeating it.

A medal of merit has been awarded to Mr. W. A. Mellon for a design which is much more pretentious and not so good in style. Its features and details are almost absolutely characterless, though pleasing enough in themselves; and the design, as a whole, hangs together and stands up well. This tower stands on a raised platform approached by steps, and each side is treated alike, although there is a door in one side only. It is hardly the thing to have steps leading up to a window or a blank wall, and in a case like this, where only one door exists, it would have been better to treat the platform on the other sides of the tower differently from the entrance side. The prize design is better in this respect, as it has a few steps up to door only; the entrance side is treated differently from the others, and so is more expressive.

The design under motto "Fafnir," has more character than that placed second, although it is not so pleasing. The angles over the clock, filled up by the crouching figures, are very weak and unhappy. The drawings of this design are coloured; the perspective is not very good.

"Andromeda" has gone out of his way to produce a variant on the west front of St. Mary-le-Strand. Not knowing what to do with the unnecessary accommodation this provides, he calls it "museum." Surely it is so much better just to stick to the programme and give what is required; a clock chamber at sufficient height from the ground, a belfry over it, and a roof on the top.

The design by "Hollyhock" is interesting. The perspective shows a real ability for pen and ink, and the whole design somehow suggests that its author has it in him to do good work; but this is quite off the right lines. It is not in the least like a clock tower and belfry, and it irresistibly reminds one—with a thousand apologies to the designer—of a design from a child's architectural box of bricks, made in Germany. It is not practical. Where are the clock chamber, and clock case, and weights? Where are the bells hung, how do they ring them, what is the meaning of the segmental pediment, &c., &c.? It is a pity to see ability wasted in this way.

The design by "Kudos" has a certain amount of novelty and right character. The drawings are good, and the figures well put in.

The design by "Sphinx" strikes one as being one of the best. Its general appearance is more characteristic of its purpose. Its proportions are happier. It is treated with a wide-spreading base, with steps leading up from all sides to entrances on every side of the tower. Altogether it seems more original and more artistic.

The Owen Jones prize is awarded to Mr. G. A. Paterson for a dainty and delicate set of drawings that show much care and pains. They are principally from Italy and Sicily. The interior view of the aisle of St. Mark's, Venice, strikes one as being out of tone, and as not giving the colour effect of the original. San Miracoli seems better in this respect.

A medal of merit is awarded to Mr. J. B. Fulton for a set of drawings that are strong and rich in colour and show much ability. Mr. Fulton, indeed, seems to possess quite exceptional powers as a draughtsman. He exhibits a great number of sketches executed while on his tour as Tite prizeman for last year. Some of these sketches, such as the views of Rome and Florence, are quite charming; and the drawings of statuary are remarkable for spirit and strength. The great danger of this sort of work seems to be that the artist gets to look on every object, whether building or statue, simply as a subject on which to show his skill. Everything, however diverse its natural character, is rendered in the same way, and becomes simply an excuse for a charming black and white pattern and tangle of lines, and so the artist eventually begins to think a great deal more of the cleverness of his pattern than of the qualities of the objects he represents. His pencil simply runs away with him. This is hardly the way to derive much benefit from the works of antiquity, nor does it show sufficient respect, either to nature, or to the works of the great artists. Of these present drawings, while the views of Florence are delightful in their way, those of many of the well known buildings fail entirely to represent anything of their characteristic beauty; although at the same time they are charming as mere examples of line drawing. The same thing is seen in the drawings of statuary. There are, in some of them, a wonderful life and spirit, and a fine feeling for quality of line; but as a representation of the subject, look at the sketch of the Medici tomb by Michael Angelo, which really is no better than a caricature, as a representation of the figures of Night and Day. This design has been treated as an excuse for a pattern, and though this sketch exhibits the same fine quality of line, it is about as badly drawn, in the real meaning of the word, as it possibly could be. There is little doubt that Mr. Fulton has been endowed with a rare gift—a gift of the gods; might one be permitted to remind him that it carries with it an equal responsibility?

The Pugin Studentship has been awarded to Mr. James M'Lachlan, and a medal of merit to Mr. J. A. Woore. There are a great many drawings in for this prize, showing a high standard of work, and it cannot be easy to pick out the best, for there is not much to choose between several of the sets.

The silver medal goes to Mr. Fulton for his drawings of St. John's College, Oxford. A charming subject, charmingly rendered. The elevation to the quadrangle, with its wealth of carving, is illustrated by a most harmonious and artistic drawing.

The Soane Medallion has been awarded to Mr. C. E. Power for a design which exhibits so many and such radical defects that one is reluctantly forced to the conclusion that this award needs explanation. The only apparent reason for the success of this design is the pleasing general effect of the elevation, which is quiet, simple, and dignified. But the question is, how is this effect obtained? A glance at the plans reveals the fact that they have been distorted and spoilt to produce a purely arbitrary external effect, which, though pleasing in itself, is not the expression of the plan, and so, in an artistic sense, is false and dishonest. The width of the central projection, with large pediment, is purely arbitrary; it expresses the position of the main cross walls neither on the ground floor nor on the first floor, and these cross walls are not even over one another. The pediment itself is a sham. Behind it we find (instead of a roof following and expressed by the slope of the pediment) the roof ridge, parallel with the front of the building, and in the slope which starts up and back from the level of the spring of the pediment, the skylights for the life room, which is the central room on the first floor.

The two end projections, which form the angle features of the design, have nothing whatever to do with the plan, and simply express nothing. The corner rooms are utterly spoilt by this arrangement, and the projections are used as cupboards. The same thing happens to the lecture theatre end of the back elevation on the first floor

The range of four large windows, between the central and end projections, are again arranged without any regard to the rooms inside. Cross walls butt into the narrow window mullions. What would be the internal effect of the council room, with one large semi-circular window out of the centre, and a small portion of another jammed up in the corner? This sort of thing is not architecture. If the ground and first floor plans be compared it will be seen that they have little relation one to the other. Cross walls, with chimney stacks, shown on the ground floor, disappear entirely on the first floor, where the rooms occupy the entire width of the rooms below and the width of the corridor. The flues have therefore to be taken across half the width of the room and the width of the corridor to the outside wall before they get to the first floor level, where they are sometimes shown on the drawings and sometimes not. On the ground floor a library runs as one big room along one side of the building; on the first floor the main wall of the large hall is continued across this room as a thick, structural wall, with a chimney stack on it, butting against the outside wall over the centre of a large window; and the lecture theatre, which occupies part of the space above the library, has simply no connection with the walls below. This sort of thing is not even building.

The fact is that the ground floor is one design, the first floor is another, and the elevation is a third which has nothing to do with either.

Inside the building are two areas for light, which, on the ground floor, are none too large for light and ventilation; on the first floor a wide corridor is taken across one end, diminishing the area by about one-third. Apart from the bad construction, this is entirely contrary to the general principle that all such areas should get larger as they go up, and the building be set back, if possible, for the better admission of light and air. With regard to the elevation, taking it as we find it, and considering it simply as a screen to what is behind, it is possible that, as a matter of taste, it would have looked better if the four divisions of windows each side of the central block could have been three or five.

Considering that the designer has evidently felt himself at liberty to do as he liked in the matter, it is rather curious that he did not arrange this, and considering how much restraint and good feeling this elevation shows it really is very curious that he did not feel how hideously inartistic so false an effect must be. This design is illustrated by a perspective, which also appears to be somewhat of a false effect. The building is shown standing above a range of three terraces, with retaining walls, balustrades, and steps, which rise up from a lake or river. The height of the spectator's eye is taken somewhere about the level of the balustrade of the lowest terrace, while, at the same time, as much of the building is seen above the top of the highest terrace balustrade as if the eye was somewhere about that level. Had it been shown correctly the top balustrade would have cut off a considerable portion of the building, and would have given it quite another effect.

On seeing the award go to this design one naturally expected to find that all the others were similar, only worse, but this is not the case. One cannot help feeling that by this award a certain amount of injustice has been done to the other competitors, and from another point of view, a graver injustice still to the successful student, who will naturally be encouraged to proceed on lines that will lead him nowhere, for it is not too much to say—and it is a thing which should be said—that to produce architecture by such means as this is utterly and absolutely impossible.

Hanging just opposite to this design is one with the motto, "Insperata Floruit," which—whatever faults it may possess—is at least a sensible and straightforward plan, with a sound, general scheme of construction, which the author has endeavoured to express in a straightforward and natural manner in the elevations. Its faults in this respect are the architectural and refreshment rooms, and, in a less degree, the museum in centre. The central areas are far better than in the prize design, and, widening as they go up obtain a much better circulation of air. A fault that is common to both this and the prize design is that the main horizontal lines of the building do not express the floor levels. The large columns break through the first floor line, and the main entablature is, in this case, about half way up the height of the first floor floor. An attic above this entablature is perforated with circular openings. As these first floor rooms are principally painting and modelling classrooms, these circular openings, giving spots of light inside, are not good.

The elevation generally is not so pleasing as that of the prize design; by comparison it is clumsy, and many of the features are out of scale and proportion, but, what is of far greater importance, it is more truthful and more expressive of the plan. Taking this design all round, it is better construction, better expressed, and an attempt on right lines; and if this is so, it is better than the prize design, and more the sort of work that should be encouraged by the Institute.

To a great extent the same remarks apply to the design by "Tendimus." This also is straightforward construction, simply expressed. It has defects of arrangement, such as the position of the lavatories at and over the front entrance. It is no doubt handicapped by being in an unfashionable style, the Neo-Greek, but its elevations are, in their way, quite as good as the prize design, and the general construction of the scheme is far superior.

The great difference between these two and the prize design is that these two, in their different ways, with their different degrees of success, are both on the right lines, while the prize design is not.

Of the other designs, perhaps "Autumn Tint" is the best, though the plan has grave defects of arrangement.

Correspondence.

DAMP IN DISTEMPERED WALLS.

To the Editor of THE BUILDERS' JOURNAL.

HULL.

SIR,—With reference to the reply to "T. B. W." on page 376 of your issue for January 17th, I have had a lot of experience in colouring new walls with various distempers, and I find that, so long as you use only primary colours, everything works well. In nearly every instance where I have used green I have found that the lime in the plaster has eaten out the blue and left the yellow. Blues and greens should be especially avoided. Ochres, reds, browns, and pinks may be used without any fear.—Yours faithfully, P. T. R.

SEWAGE PURIFICATION WITHOUT FILTRATION.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, E.C.

Sir,—May we be permitted to again refer to some of the more important points raised in our letter in your issue of January 10th, to which Mr. W. Kaye Parry takes exception in his reply of January 17th?

We have read his address to the Dublin University Engineering Students' Society, and are quite willing to accept his figures; they are however, calculated from estimates for future installations, not from returns of actual working, such as those we quoted; and we submit that no matter how eminent the authority may be who prepares an estimate, the actual results of careful experiments are preferable as a basis of calculation.

We set out in our letter that our own experience had been in connection with small installations; but may it not be fairly argued that if a small plant can be worked economically, a larger one will show still better results.

The cost per million gallons of 10s. 6d. represents the cost of the nitrate of soda alone, nothing being allowed for preliminary screening, application of the chemical to the sewage, or sludge disposal; the figures we quoted respecting Sutton are taken from the published accounts, and cover a year's working in each instance, namely, the year ending March 31st, 1895, for chemicals and broad irrigation; and that ending March 31st, 1899, for biological treatment.

In the first case, 69,888,000 gallons cost on an average £15 11s. 11d. per million, taking into account the amount earned by the farm and sale of sludge, which came to £117 7s. in the year; in the second case, 157,164,000 gallons, or more than double the quantity, cost only £3 19s. per million, with a larger set-off from the farm of £384 19s. 4d.

The experience at Sutton has been that the effluent produced by the old system of chemical treatment would not satisfy the requirements of the Thames Conservators, while the biological effluent did, and still does to-day.

The sludge pressing cost £7 a week up to 1895; there is no sludge now, and no offensive odour proceeds from the beds with a flow of 500,000 gallons a day.

The sewage of Sutton may be described as domestic; moreover, it reaches the farm in a very short time after entering the sewers, and in a comparatively fresh condition, necessitating screening for the removal of paper; it also contains a good deal of mineral detritus.

The sewage of London presents more difficulties as it contains "manufacturing refuse of the most varied description" (we quote from the report of Dr. Clowes to the London County Council), and later in the same report, "the coke beds have removed the whole of the suspended matter or sludge." This refers to raw sewage.

Reporting on the sewage of Manchester, which is particularly rich in trade refuse, Messrs. Baldwin Latham, Frankland, and Perkin are in favour of biological treatment without the use of any chemicals.

With the support of such authorities as these we are encouraged in our opinion that for small or large quantities of any class of sewage biological treatment, pure and simple, compares favourably with any other at present in use.

We look forward with more than usual interest to the next volume of "Specification," and thank you for allowing us to so far trespass on your valuable space.—Yours faithfully,

HENRY OUGH AND SON,
A.M.I.C.E., A.R.I.B.A.

CLEANING WINDOWS.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—Now that the London County Council are seriously contemplating framing by-laws prohibiting the cleaning of windows from the sill on the outside, the suggestions of your correspondent A. E. Goddard, on page 370 of the issue for January 17th, are valuable and opportune, and my object in writing is to accentuate the fact that, if similar regulations are adopted in London as were attempted in Glasgow, the effort would prove equally as futile.

Your correspondent is apparently misinformed as to the nature of the Glasgow by-law dealing with the matter. It came into force, I believe, in 1894; it was not to the effect that no person was to sit or stand on the sill, *but* that no new building would be certified as habitable unless fitted with windows which could be cleaned from the inside of the room.

The result of this regulation was that a great number of devices (some new, but the majority old ones, varied) were put before the public. Most of the ironmongers of any note throughout the city had a patent window, and the office of the master of works (corresponding to our superintending architect) was for months inundated with pattern windows, to enable the Dean of Guild Court to select one which they could recommend. An exhibition was held, prizes offered, and yet with all this the by-law is not enforced, but is a dead letter. The City Trust Corporation themselves practically evade the by-law in many of their new buildings in the vicinity of the Trongate and Salt Market.

The requirements in a reversible window with sliding sashes are:—(*a*) Sashes hung on both sides; (*b*) sound construction; (*c*) so simple in action that an ordinary girl can safely reverse it; (*d*) no complicated parts whatever; (*e*) not likely to get out of order; (*f*) inexpensive.

Now it has been proved that no reversible sashes have been or can be made to satisfy all these demands. The extra cost of what may be termed the Glasgow windows varied from 9d. to about 20s. each opening. The first-named series were miserable makeshifts; the latter were complicated and so expensive as to be prohibitive in ordinary buildings.

The nearest approach to the above requirements is the window with divided stiles; yet this is bad construction, as it is weak and very likely to jamb and get out of order, for if the sash stiles of a window are of the ordinary width (that is, 2¼in. to 2½in.), they are right, both as to strength and appearance. It follows, therefore, that the stile is too weak if it is divided, and if made wider it would be clumsy and obstruct the light; and there are other objections which need not be dealt with now.

The reversible windows, then, judging by past experience, cannot prove a satisfactory remedy, and as to sitting or standing on the sill with protective guards of whatever nature, this is antiquated. An old but unrepealed Act prohibiting such a method of cleaning windows is also a dead letter, for the reason, it may be presumed, of its impracticability.

The remedy, then, to be a success, must be on other lines—namely, a simple apparatus by which a person of ordinary intelligence may clean the outside of the window from the inside of the room, and on the floor level; and, I am informed, that such a contrivance is about to be put before the authorities and the public. An apparatus at a cost of perhaps 10s. that will answer for any number of windows must, on the face of it, be preferable to either the complications and expense of a reversible window at an extra cost of, say, 10s., or the cost and expense of erecting a protective guard sufficiently strong to answer the purpose.

Thus, I conclude that an apparatus for cleaning is the only simple solution of the difficulty, and the old Act has but to be revived and put into force throughout the country and extended to London.—Faithfully yours, A LONDON SURVEYOR.

TILE FIXERS AND BRICKLAYERS.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, S.W.

SIR,—Will you allow me to put before your readers, and trade unionists in particular, our position as tile fixers in the recent disputes with the bricklayers, who have gradually, and of late most persistently, laid claim to tiling (both wall and floor) when it has been straightforward work and in a large enough quantity. They claim the work by saying that the size imitates brickwork, or else that all tiles are bricks, and therefore it is part of their work to fix them, and threaten to strike if tile fixers are allowed to do the work. In many cases the builders, through pressure, have been forced to give way and allow bricklayers to do the work, while the tile fixer, whose trade and only means of livelihood it is (all of whom have been engaged working for years at it, and are thoroughly qualified to undertake all classes of work satisfactorily), are obliged to stand by and see a strong society (by means of its strength) gradually appropriate their trade.

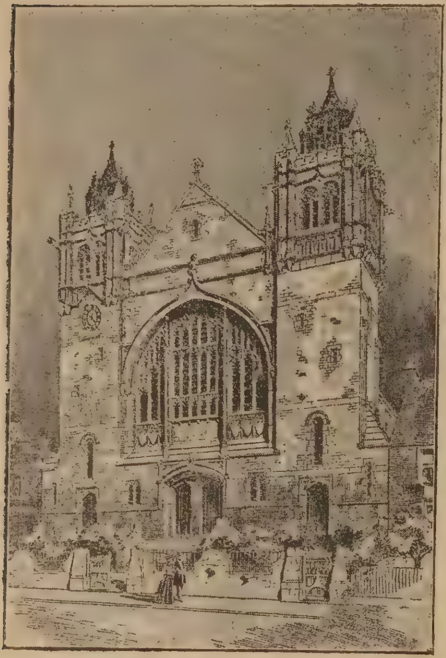
Remonstrances to them have proved useless, and have been treated with contempt, and we therefore appeal to all engaged in the building trade to give us their sympathy and support in upholding our right to what is, and always has been, distinctly tile fixer's work.—Yours faithfully, J. C. CARLEY,

*Secretary of the Amalgamated Society
of Tesselated Tile, Faience and
Mosaic Workers and Fixers.*

A New Branch Library at Armley, Leeds, is to be built at Stocks Hill from designs by Mr. Percy Robinson, of Leeds. The building is in the Renaissance style, and will be of brick, with stone dressings.

Professional Practice.

Bristol.—On Wednesday last the foundation stones of the new Baptist church at Horfield, Bristol, were laid by the Lord Mayor of Bristol (Sir Herbert Ashman). We give below an illustration of the church, which is estimated to cost about £7,000. The design is by Mr. R. Milverton Drake, of the firm of Messrs. Drake and Pizey, and was selected by an independent assessor in a competition amongst local architects. It is in the fifteenth century Gothic style of architecture, the lower portion of the Gloucester Road façade being kept simple and plain, whilst lightness is given to the upper portions of the towers and the bold west window, which is 26ft. in width. The material used is local pennant stone with Monk's Park freestone dressings. As regards the general accommodation, the plan provides for upwards of 1,000 worshippers in the church, whilst there are also spacious classrooms and vestries, the whole to be heated with hot water; particular attention will be paid to the ventilation. Mr. Ridd is the contractor.



NEW BAPTIST CHURCH, HORFIELD, BRISTOL.
R. MILVERTON DRAKE, ARCHITECT.

Dublin.—A new Baptist chapel has been built on the North Circular Road, Phibsborough, Dublin, from designs by Mr. George P. Beater, M.R.I.A.I., of Dublin. Messrs. E. and R. Warren, of Dublin and Blackrock, were the contractors. The chapel is built of red brick, with granite and Portland stone dressings. It is in the Gothic style, and consists of a nave and west aisle, with provision for a gallery at the north end. The building will seat about 300 persons, and is fitted with pitch-pine benches, the windows throughout being glazed with leaded lights of simple design. The roof is of open timber work, and the timber is left its natural colour, and is unvarnished. Exhaust ventilation is by means of a Keirel's patent hydro-pneumatic fan, and the fresh air supply is obtained through hopper ventilators placed about 6ft. above the floor level. In front of the platform is placed the baptistry, which is lined with white enamelled tiles, and behind the building proper, but in communication with it, are the gentlemen's and ladies' rooms, with lavatories, &c. The heating chamber is in the basement, under the vestry, and is fitted with one of Musgrave's hot-air apparatus. The caretaker's house is a separate building, but is on the same plot of ground.

THE "BUILDERS' JOURNAL" SHILLING FUND.

FIRST LIST OF SUBSCRIPTIONS.

Most of our readers are by this time aware of the fact that we have started a Shilling Fund to assist the admirable project that has been set on foot for building a Home of Rest for disabled soldiers as a gift to the nation from the building trades. Full particulars of the scheme were given in our last issue, but for the benefit of any who may not have seen that number we repeat a few details.

Character of the Gift.

The purpose of the gift is to meet as far as possible the needs, which all the patriotic funds hitherto established have to a great extent overlooked, of the permanently disabled soldier discharged from the army with a pension inadequate to supply even the barest necessaries of life. It is proposed to erect and equip six cottage homes containing in all 100 beds, and in selecting inmates for the homes preference will be given to soldiers who have at some time been members of one or other of the building trades.

The homes will be erected on a freehold site at Bisley, generously given by Lord Pirbright. Their management and maintenance will be superintended by a special sub-committee of the Sailors' and Soldiers' Help Society, an excellent institution of which H.M. the Queen is patron.

Methods of Helping.

The Executive of the Building Trades Gift, whose address is 1, Waterloo Place, Pall Mall, S.W., invite offers of gifts in kind; they have issued printed details, giving the exact quantities of materials, fittings, &c., required, and those of our readers who wish to help in this way should write for these particulars.

Obviously, however, there are many thousands connected with the building trades whose gifts could not possibly take that form, and in the hope of enlisting the help of many who would otherwise be left out, we have started a Shilling Fund.

By this means all who are in any way connected with the building trades—architects, architects' assistants, draughtsmen, students, builders, clerks of works, foremen, workmen, and apprentices—will be afforded an opportunity of taking their share in the national gift.

Some Expressions of Opinion.

We have received a number of letters expressing approval of our scheme. Mr. Edwin O. Sachs, chairman of the executive of the national gift writes:—

"I should like to take this opportunity of saying how much I appreciate the gift of the proprietors and the energetic manner in which the matter has been taken up in the Builders' Journal. I am sure you will be delighted to hear how well things are progressing in every direction."

Mr. Sam Waring, one of the stewards representing the donors, writes with reference to our fund: "I should say your suggestion is an admirable one, likely to be taken up with enthusiasm and well supported."

A well-known technical instructor writes: "Allow me to congratulate you upon the Builders' Journal Shilling Fund. I will do my best to assist the fund; please send me a dozen collecting forms, and I will place them in good hands."

A very gratifying communication, the first, we hope, of many similar ones, reaches us from Mr. A. Shearing, builder and sanitary engineer, of Kentish Town, who writes: "I have pleasure in enclosing cheque in aid of the Builders' Journal Fund, subscribed by my employés to-day, including a subscription from myself. I am pleased to add that every hand subscribed most willingly." We feel sure that a similar willingness would be displayed by workmen generally if their employers would set them an example of generosity as Mr. Shearing has done.

The following is a list of subscriptions received up to Monday afternoon:—

		Shillings.
Proprietors of the Builders' Journal		1,000
H. L. Florence, F.R.I.B.A.		200

		8
Total		1,486½

In addition to these gifts in money we have received from Messrs. Lander and Co. an offer of some warm air grates; this offer we have passed on to the executive of the gift, who are inviting contributions in kind. Many applications have been received for the collecting forms which we have prepared to enable readers to enlist the help of their friends. We shall be glad to send these forms to any of our readers who will make good use of them.

Contributions, which may be by cheque, postal order, or stamps, should be addressed to—

Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

GROINED VAULTS.

Cardiff.—Student writes :—"Is there any book published dealing with constructive masonry, more especially with groined vaults, and how to draw them, as required in the testimonies of study for the R.I.B.A. final examination?"

"Practical Masonry," by William R. Purchase, price 6s., is a good book on the subject. It can be obtained from B. T. Batsford, 94, High Holborn, W.C.

SETTLERS' HOUSES.

Glasgow.—J. D. M. writes :—"Can you tell me of a book dealing with the construction of wood-frame houses as used by colonial pioneers?"

No book has been published on this subject, but "New Cottage Homes and Details," by Messrs. Palliser, architects, U.S.A., price 15s., will supply much useful information. Mr. Batsford will supply it.

FIXING HINGES IN STONE STEPS.

Enfield. — Constant Reader writes :— "Which is the correct way to fix the box of swing hinges into stone steps?"

I have fixed springs in stone landings with Portland cement, with satisfactory results. Sufficient time—say four to eight hours—must be allowed for the cement to set before using the springs. If the landing is thin, and you should cut through, then you must first stick up a slate with plaster of Paris to hold your cement in place. If, however, you cannot use cement, screw down from the floor plate into lead plugs, cutting the holes slightly larger at the bottom, and filling them with molten lead and caulking. G. H. J.

CARRYING UP CHIMNEYS.

Grimsby.—C. E. T. writes :—"By reason of new buildings being taken up higher than the buildings previously existing on a site, the chimneys of the old premises smoke. Is the owner of the new premises legally bound to carry up the old chimney stacks to prevent smoke nuisance, and if such be the case and any settlement is thereby caused to the old premises, who is liable for the damage? The new and old premises are owned by separate parties."

The owner of the new premises is not legally bound to carry up the chimney stacks to prevent the smoke, nor has the owner of the old premises any remedy against him. The very point was decided by the Court of Appeal in the year 1879, in the case of *Bryant* v. *Lefeever*.

DOWN-DRAUGHTS IN CHIMNEYS.

Maidstone.—W. T. W. writes :—"Could you kindly tell me the best remedy for down-draught? I have a chimney stack which contains three flues, ground floor, first floor, and second floor, and in each of the rooms there is a peculiar smell; it seems stronger for about half-an-hour after the fire is lighted, but gradually goes off. One of the flues has a ventilator fixed just below the ceiling line in the room. I should also like to know the simplest book I could get on measuring up work of all kinds."

Before attempting to cure a down-draught it is advisable to find out what causes it, and upon this point the querist's letter sheds no light. Rather, it might be inferred, and with some show of reason, that the trouble complained of arises not from down-draught, but from a sluggish up-draught. When a flue will not "draw" properly upon a fire being lighted at its base, a simple cure, though a somewhat risky one if the flue is foul, is to first light a handful of shavings, or a sheet of newspaper, just above the fireplace immediately before applying a light to the fire. This starts an upward current of warm and lighter air, and usually the moist and smoke-laden air which arises from the kindling of the fuel will follow it. Down-draught is usually the result of a short straight flue, or the "flopping" of the wind down on the flue after contact with some adjacent higher building, but it may arise from a variety of other causes, failing the locating of which it would be advisable to consult some local expert. The simplest work on measuring is Beaton's "Measurer and Estimator," price 1s. 6d. (Crosby, Lockwood and Son).

PERCENTAGES AND PROPERTY VALUATION.

Tunbridge Wells. — X. writes :— "Will you kindly inform me what are the recognised percentages to allow for all outgoings in valuing property. I know the recognised *individual* allowances, but wish to know of a short method to obtain the net rental of property by taking off *one* percentage from the gross rent. If you can give this for different classes of property I shall be very much obliged."

There is no one recognised percentage to be deducted for all outgoings, as very little consideration would show that such could not apply. Outgoings may include repairs, rates, taxes, tithe, insurance, management (or agents' fees), fee-rents, fines, renewals, and a host of other things; or the necessary deductions may be very few and simple. A common deduction for repairs on house property is 10 per cent., being 5 per cent. for internal and 5 per cent. external repairs; but on small residences 12½ per cent. is necessary, and on cottages 15 per cent. or even more. The net can approximately be arrived at from the gross in the case of house property by deducting from the gross :—One-fourth if gross value is under £20; one-fifth if it is over £20 and under £40; and one-sixth if it is £40 and over. The Metropolitan Assessment Committee publish a scale showing the maximum rates of deductions for rating purposes, differing for no less than eleven different classes of property. E. BRAND, P.A.S.I.

ASPHALTE AND CONCRETE ROOFS.

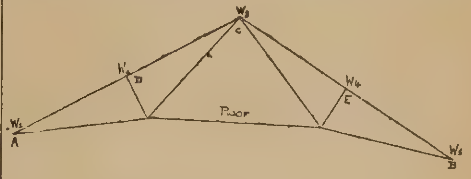
Birmingham.—F. writes :—"It is proposed to construct an asphalte and concrete roof over a corridor 10ft. wide. Steel joists could be supported on the side walls at intervals of 3ft. 6in., but no intermediate support for the concrete is possible. What would be the cheapest, lightest, and most shallow method of construction? Also what is the least bearing necessary for the concrete resting on the flange of joist?"

For cheapness, combined with strength and permanency, use Portland cement as a matrix, and a good local waste, or lye product, as an aggregate, gauged in the proportion of one part of matrix to five parts of aggregate. For lightness use coke breeze or pumice stone as an aggregate. Mix the matrix and aggregate thoroughly together in a dry state, then add just sufficient water to render the mass stiff but plastic, and then incorporate the whole by rapid and regular mixing, and gauging by the aid of a drag or "larry." Lay this stiff concrete as soon as gauged on the centering in layers about 3in. thick, and well ram and beat each layer until flush with the tops of the joists. For a shallow floor, fix wood centering against the lower surface of the joists, and after the concrete has been laid and set strike the centering, and set the whole ceiling surface with gauged putty, lime and plaster, or with one of the white and quick-setting cements which are manufactured in Birmingham. The upper or floor surface may be finished with a fine Portland cement concrete instead of asphalte. If the fine concrete is laid while the rough concrete is green, the whole would be one consolidated and impervious body. With regard to the least bearing for the concrete on the flanges of joists, a bearing of 1in. would be sufficient for joists 3ft. 6in. apart. Unless open spaces or channels at the sides of the joists are required for some special purpose, allow the concrete to take the full bearing on the flanges and sides of the joists, which will strengthen not only the joists, but also the roof, and also reduce the cost of construction. If open spaces at the sides of the flanges are required, lay hollow cast concrete blocks along the sides of the joists before the concrete is laid. This method would reduce the cost, and increase the general strength of the work.

W. MILLAR.

STRESSES IN ROOF.

Neath.—F. S. J. writes :—"Kindly state which method for obtaining strains in roof members is correct. Fig. 1 is from Rivington's and Fig. 2 from Wilson's 'Building Construction.' The base line XY in both represents the total weight, and as the construction in Fig. 1 starts from the extremities, and in Fig. 2 from points nearer the centre, it stands to reason that the same result cannot be obtained by both."



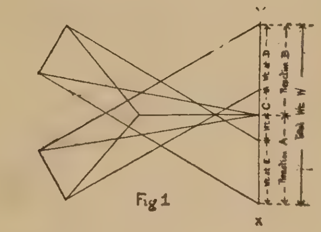


Fig 1

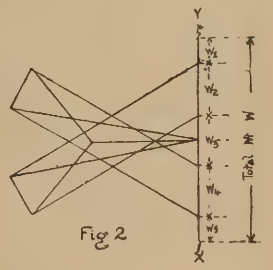

Fig 2

Both results are correct for the conditions given, but in "Notes in Building Construction," Vol. IV., Plate 3, Figs. 356-7, the external load acting at foot of principal rafters, not passing through the truss members, is omitted. In Wilson's illustration this load appears, as it should do, in both frame and stress diagram.

HENRY ADAMS.

Mr. William Edwards Tirebuck, of Liverpool, died last week. Among other books, he wrote "Dante G. Rossetti; his Work and Influence," "Great Minds in Art," and "William Daniels, Artist."

New Workhouse for Hunslet, Leeds.—Three years ago the Hunslet Guardians spent several thousand pounds in building and equipping at Rothwell Haigh a series of cottage homes for poor children; in a week or so the new offices erected in Glasshouse Street, at a cost of £2,500, will be ready for occupation; and tenders are now invited for a new Union workhouse, estimated to cost £60,000. The site is at Rothwell Haigh, some distance from the children's homes, and the buildings will be on the pavilion system, comprising receiving wards, tramp wards (on the cell principle), administrative block, residence, committee and work rooms, dining hall, and stores. Altogether, provision will be made for between 400 and 500 inmates. Mr. J. H. Morton, of South Shields, is the architect.

Bricks and Mortar.

APHORISM FOR THE WEEK.

"There is a time in every man's education when he arrives at the conviction that envy is ignorance; that imitation is suicide; that he must take himself for better, for worse, as his portion; that though the wide universe is full of good, no kernel of nourishing corn can come to him but through his toil bestowed on that plot of ground which is given to him to till."—EMERSON.

The Cates Competition. THE following are the conditions for the competition for the Paris Exhibition Prize, 1900, offered by Mr. Arthur Cates:—Candidates to be members of the Architectural Association, without limit as to age; to have passed the R.I.B.A. final examination, or to have passed the intermediate examination; and also to submit drawings equivalent to the testimonies of study required to be sent in for the final examination. To also submit practical working drawings and some brief descriptive reports of a technical character, satisfactory evidence of ability in architectural and constructive design, with good, accurate draughtsmanship, being essential. Application, with drawings, &c., to be sent in to the honorary secretaries at 56, Great Marlborough Street, W., not later than April 30th next. The examination to determine the award of the prize to be partly written and partly oral, and conducted by gentlemen appointed by the committee. The subjects will be:—(a) French, as written and spoken; (b) technical French, as used in relation to architecture and building; (c) the metrical system, and its application to architecture, building plans, surveys, and accounts; (d) general knowledge of architecture, if thought necessary by the examiners. The examiners will have full power to award the prize or not, as they may think fit. The successful candidate will be required to spend not less than four weeks in Paris to study, examine, and report on the architecture and buildings of the Exhibition, and must, on or before December 22nd next, deliver to the honorary secretaries an accompanying illustrated descriptive report. The successful student will receive £20, to be paid in two instalments, the first on his leaving England, and the second on his submitting the illustrated report to the satisfaction of the committee of the Architectural Association. He may be required to read a paper before the Architectural Association on the subject of his study. The illustrated report, or a complete copy, to be presented to the Architectural Association, who shall have the right to publish the whole or any part in "Architectural Association Notes."

The Late Thomas Collins. IN reference to the late Mr. Thomas Collins, whose death we recorded in a recent issue, a well-known architect who knew him well, writes:—"In the late Thomas Collins, head of the firm of Collins and Godfrey, of Tewkesbury, the building trade has lost one of the most honourable and high-minded men that ever adorned it. He rose from small beginnings to his eminent position not only or mainly by industry and ability, though he had plenty of both, nor certainly by attention to his own interests, of which he thought very little, but by force of character. His rule over his foremen and other employees was patriarchal. He knew them not as 'hands,' but as men, and his kindly shrewdness taught him how to pick them. If an architect complained, he took the blame himself and never blamed others; but afterwards, 'when the old gentleman was displeased,' the right people knew of it. The short, thick-set figure, the massive head and broad homely face, with blue eyes very far apart, the old-fashioned courtesy of his manner, and the humour and kindliness of his talk made up a personality not to be forgotten. His work is well known and wide spread. This note is only of the man himself—the 'candida anima' of his profession."

Enamel Painting. THE foundation of a painting in enamel, said Professor Herkomer during a recent lecture at Burlington House, is copper. For his part he did not believe in convex plates. It seemed to him essential that for pictorial purposes the plate should be as nearly flat as possible, and most of his later enamels were practically flat. The lecturer then explained the use of the wooden blocks on the table. The copper plates were cleaned on them, before commencing to paint, with the aid of an engraver's flannel "dolly" and emery powder. The old plan was to use acid, but he did not like it. The absolute cleanliness of the copper was, however, essential—the least fraction of grit or finger-marks might ruin the plate. The next thing was to cover the plate with the first flux, and the lecturer gave elaborate directions for preparing the enamel powder by grinding it in an agate mortar, and subsequently washing it many times to get rid of the milky impurities which, if allowed to remain, would make the colour muddy and dirty. The method of applying the enamel powder to the back and front of the plates was then described. The back was not so important, but the spreading of the coating on the front required great care. The plate was now ready for drying and firing, and the uses of the muffle, of the high stove, and of an ingenious screen of glass and asbestos designed by the lecturer, were now made clear. The time occupied in firing had to be judged from feeling and experience—science could not measure it. Through the asbestos and glass screen you could peep at your work now and again, and when done the plate should have a certain brassy, salmony appearance. When cool, the plate was ready for the tracing of the design on it with carbon paper—a design which should have been made beforehand with the greatest possible care. "To every painter," said the lecturer in conclusion, "comes a disappointing moment in the middle period of his career—a moment when he begins to feel the limitations of his art. A change of some sort is wanted, and at this time painting in enamel will serve a man if it suits him. It is emphatically work for an artist's middle period."

The Origin of Granite. AT a recent meeting of the Manchester Literary and Philosophical Society, Mr. C. E. Stromeyer, M.I.C.E., attempted to explain the apparent paradox, noticed in granite and similar rocks, that the felspars, hornblendes, &c., must have crystallised before the quartz which surrounds them, although the melting temperature of quartz is much higher than that of the other minerals, the difference being as great as that between the melting temperatures of lead and ice. The author suggests a possible method of freezing, say, water or felspar while the one is in contact with molten lead and the other with molten quartz, one of the most infusible substances known. The rate at which the earth's temperature increases the deeper one penetrates into it is fairly well known, from which it is estimated that at depths of from 50,000ft. to 200,000ft. the melting temperature of both quartz and felspar will have been reached; but at these depths the earth's pressure exceeds even that in gun barrels caused by the explosion of powder. This enormous pressure must produce a considerable change of melting temperature in the minerals of granite, and the author suggests that certain experiments, which he indicates, should be made to determine the amount of change.

Chances of Fire at the Louvre. THERE exists at present in a wing of the renowned Louvre at Paris an appreciable risk of fire. Everybody recognises the danger, the authorities as well as the public. Owing to a lack of space (and funds) it has been found expedient to house the Ministry of the Colonies in a wing called the Pavillon de Flore. Governmental departments of all kinds enjoy a reputation for collecting huge bundles and stacks of official papers, and in France this matter is carried to an abnormal extent; so that at the present time the Colonial offices are packed from floor to ceiling with inflammable material. To make matters still worse, stoves are provided for heating purposes, and the pipes from these run over the wooden partitions which have been erected to divide up the different rooms. All that is needed is a spark, or the flues to become overheated, either of which is equally feasible. Then, as soon as the Pavillon de Flore was well alight, very great difficulty indeed would be experienced in preventing the outbreak spreading to the Louvre proper, which is an old and inflammable building. It need hardly be pointed out that such a policy as this is a most wrongful one, and it is to be hoped that better councils will prevail, and other accommodation will be found for the Ministry of the Colonies, in order that a present danger to those inestimable art treasures at the Louvre may be removed.

The Basilica Emilia. MANY discoveries are being made by the excavations of the Basilica Emilia at Rome. Penetrating from its southern porticoes into the central area, or nave, it has been found that in the third century, owing to some disastrous fire or collapse, the dividing wall had to be entirely rebuilt with brick and coated with marble; except towards the eastern extremity of the building, where the tufa walls of the Augustan Basilica have survived to some considerable extent. Tons upon tons of "Africano" marble (the remains of columns) have been brought out by the workmen; but not even a chip of the Phrygian (or pavonazzetto) marble, which, according to Pliny so impressively adorned it. These third century drastic restorations naturally suggest that the interior of the building must have suffered in such a manner as to have included the destruction of the Phrygian columns. The pavement of the central hall, or nave, is composed of slabs of "bigio" and "Africano," but the most important evidence regarding the basilica is that with regard to its size. Instead of proving to be anything like the limited edifice represented in well-known topographical works, it is manifest that it was no less than 300ft. in length, that is only 35ft. less than its great rival the Basilica Julia.

Our Inset Sheets. THE eighteenth century porch and doorway is seen in South Kensington Museum, and is placed at the end of the English furniture. It originally formed the entrance to a house (now demolished) in Great Ormond Street. The porch is dated 1707, and is executed in pinewood; the fanlight over the door being formed in lead. The Museum authorities know nothing further of its history. The illustrations are from measured drawings by Mr. Philip J. Turner, of 112, High Road, Chiswick, W. The perspective of St. Simon's Church, Saltram Crescent, Paddington, W., is one of a competition set, submitted by Mr. William A. Pite, F.R.I.B.A., of 3, Upper Montague Street, W.C., and placed first. The site was difficult and hampered by its restricted boundaries, but this has since been obviated by an advantageous enlargement. The materials were to be red brick and stone, and the bell turret is surmounted by a lead spire. Le Caudray is situated on a headland in Guernsey, overlooking the wild scenery of Rocquaine and the Hanois. It is built of blue axe-faced granite throughout, with sanded red tile roof, and contains a large hall, dining and sitting rooms, five bedrooms, and usual offices. It was entirely built by direct labour, as, owing to the distance from the town, no contracter was willing to undertake the work. Mr. S. Carey Curtis, of Kensington, W., was the architect. The house (erected for a Mr. Ledward) at Abinger, near Dorking, was designed by Mr. John Belcher, and is built partly of local ironstone, red brick, and half-timber work and plaster.

LEGAL NOTES FOR ARCHITECTS AND SURVEYORS.*

By ALGERNON BARKER, B.A.,
BARRISTER-AT-LAW.

THERE is a proverb which is somewhat uncomplimentary to the man who acts as his own lawyer. I venture to think, however, that a knowledge of the law may be of considerable use to a layman in preventing him, when he is on the edge of a legal precipice, from acting as his own lawyer, and in helping him to act wisely when his solicitor has left his office and gone home.

The man who would conceive and plan the buildings which act as the temples of our commerce or the nucleus of our home life, or form the outward expression of our religious devotion, meets with many difficulties. There are the brute forces of Nature—the wind which makes his Tudor chimneys smoke, or, still worse, blows them down, or the frost which lays its injunction on him during the winter. Worse still, there are jealous neighbours who allege that he is encroaching on their fields, or wrongfully leaning against their buildings, or darkening their ancient lights. Then he may have to keep a wary eye on the builder, to see that the building contract is duly carried out. Again, there are the local authorities, armed by Parliament with extensive powers in the hope that they will use them wisely, and it is with the powers of these authorities that I now propose to deal with. The law I wish to lay down must, however, be taken with this qualification, that it does not necessarily apply to the metropolis or to Scotland.

The statutes that concern us speak of "buildings" and of "houses," and it would be well at the outset to ascertain what these words mean. In construing a word you must take it in its ordinary and popular sense, unless you gather from a perusal of the whole Act that it is to be otherwise understood. Further, so far as possible, without straining the language of the Act, you must carry out its intention. This intention must be gathered from the words of the statute itself, the whole of it being duly considered.

The Meaning of "Building."

First as to "building." This word occurs in two kinds of provisions, and its meaning varies according to which of these two provisions contains it. It occurs in provisions for the benefit of the public generally and in provisions for the health and safety of inmates of buildings. I must emphasise the chameleon-like nature of this, and indeed of all words. It is of little use to search through cases as to inspecting dilapidations, or as to voters' qualifications, in order to ascertain the meaning of this word.

In provisions for the benefit of the public the word "building" must be taken to include any structure, whatever its material, if only it is large enough, and is intended to be permanent; thus a wall 15ft. high is a "building" in breach of an obligation not to build within so many feet of the footpath, and a huge wooden trellis is a breach of a covenant against putting a "building" in a yard. If, however, the size is not great the erection will not be a "building"; *e.g.*, a small conservatory 4½ft. by 2½ft. was permitted to project in front of the line of buildings, and in another case a small railing; and it was held that a wall 5ft. high was not a breach of covenant against building within so many feet of the footpath, as it was about the height that would be necessary to secure privacy against pedestrians. I have quoted several cases of covenants, but the principle is the same. As to the necessity for permanence, the case with regard to the huge wooden trellis above alluded to may with advantage be examined. Common sense tells us that in order to carry out the purposes of these restrictive covenants, or of statutes forbidding "buildings" in certain places, a wall must be included, for it would be almost as objectionable if it broke the vista of our streets or encroached on our public parks, or on our highways, as would any other building.

Very different, however, is the meaning of the word "building" when it is found in provisions for the health and safety of inmates. A "building" in these provisions requires size and permanence, as it did in the former class of provisions, and thus your builder's shanty, intended to be removed when the new terrace you are putting up is completed, does not come under the term "building." One other condition, however, is requisite, and that is capacity. To use more homely language, it must be something a man could get into and move about in, and must have a roof to shelter him. But if these conditions are present, it matters not that the house is uninhabitable. It may have no fireplace, no chimneys, and no foundation. It may be of any material. It may have wheels, if it is used for the purposes that buildings are used for. Thus, night houses for cattle and coach-houses have been held to be "buildings" for the purpose of these provisions, but not a boiler standing on a base of bricks 4ft. high.

The Meaning of "House."

Next, as to the meaning of the word "house." This word does not occur in provisions for the benefit of the public, but it is frequently found in the other class, provisions for the health and safety of inmates. It requires the three conditions of size, permanence, and capacity mentioned above, but adds to them one other, that is, habitability, though this may be absent if the word comes under the interpretation clause mentioned below. Thus, it includes an unconsecrated chapel which was inhabited by a caretaker, and the whole of which could have been inhabited without any structural alterations. Conversely, nothing that is uninhabitable, unless it comes under the interpretation clause, can be a "house." This lack of habitability may arise from two causes—from structural defect in the absence of such things as a fireplace, windows, or doors, or from the legal bar to using the structure for purposes of habitation, which results from consecration, as in the case of a church, which has been held not to be a "house" in this connection. Thus, we must exclude such opposites as a cowhouse and a church. We must, however, in accordance with the interpretation clause of the Public Health Act, as modified by later Acts, include "schools, factories, and buildings where persons are employed." Thus, taking what I may call the common law and the statutory definitions together, you might, I think, include schools, factories, offices, shops, warehouses, theatres, and all premises where a caretaker sleeps.

When the word "dwelling-house" is found in the Acts we deal with, it seems to mean a house of which the main purpose is residence. The mere fact that a caretaker resides on the premises, such as a chapel or warehouse, would not of itself be sufficient to make them a "dwelling-house." Before leaving this part of my subject, I may mention that the interpretation of the meaning of words contained in a statute is a matter of law, but the question as to whether any particular subject matter with which you may have to deal comes within the definition of any word so interpreted is a question of fact.

Your first question in considering the rules which I desire to lay down will be, "What am I building?" Some of the provisions that we shall consider apply, as we have seen, to "building" in the most comprehensive sense; others to "buildings" in the narrower sense, excluding, as I may remind you, anything without a roof; others apply to "houses" and all the other premises by judicial decision or by interpretation clause comprised in that word. Others, again, apply to particular kinds of premises, to dwelling-houses, to common lodgings, to cellar dwellings, to factories and workshops, to bakehouses, to dairies, or to schools.

Another question in considering the rules hereafter mentioned will be, "Where am I building?" or, to be more practical, "is it within the jurisdiction of an urban or a rural district council?" Much will depend on the answer to this question, so widely do the powers of these councils differ.

The differences between the town or city council and an urban district council is not great. The dignity of the former may be wanting to the latter, but so far as the provisions which affect the man who builds are concerned there is little or no real difference. Very different, however, are the powers of an urban district council from those of its humbler rural brother.

An urban district council can, by the Public Health Act, set back a building the front of which you are completely restoring, and can under another statute punish you for building beyond the house on either side of you. It can prevent you from building upon its sewers or under its carriageways. It can forbid you to build a house without a drain. Then again, by adopting the Public Health Act Amendment Act, it can gain further exclusive powers. It can forbid a room over a cesspool, ashpit, or privy to be inhabited. It can permit you to substitute an ashtub for the ashpit. It can see to the substantial construction of and sufficient ingress into and egress from places of public resort, and also to the safety of grand stands and similar erections. Again, an urban council has power to make the by-laws authorised by section 157 of the Public Health Act of 1875. And, if the Public Health Act Amendment Act is adopted, it can make by-laws as to paving of yards and open spaces round dwelling-houses and as to providing secondary means of access to ashpits and similar places for the purpose of removing house refuse.

The country cousin has none of these powers unless it obtains them from the Local Government Board. One luxury, however, the rural district council has all to itself. By the Public Health (Water) Act, section 6, it can punish the man who builds a "dwelling-house" without first obtaining a certificate that there is a water supply at a reasonable distance from it. Here again, however, the Local Government Board may step in and give this power to an urban authority at their request.

A second time again it will be well to ask yourselves, "Where and under what statutes am I building? Has the council adopted the Public Health Act Amendment Act? Is there any local Act or by-laws that may concern me? Who am I building for? Is their a special Act or are there special powers or restrictions in any Act which may enlarge or curtail my liberty?"

There are the public general statutes, such as the Public Health Act, 1875, the Public Health (Water) Act, 1878, the Public Health (Buildings in Streets) Act, 1888, the Factory Acts, the Chimney Sweepers' Act, 1840, and the numerous Acts as to town gardens, commons, and open spaces.

Then we may have to deal with an adoptive Act, the Public Health Act Amendment Act, which, until it is adopted by a district, has no more force of law in any district than some incipient Bill in Parliament. With the formalities precedent to adoption I will not trouble you. The urban council cannot pick and choose which of the sanitary provisions in Part 3 of the Amendment Act they will adopt. They must take all or none. Rural councils stand in the same position as to those provisions which they can adopt without leave of the Local Government Board, but where they need this leave they do gain a power of choice, as the Local Government Board only gives them such powers as they ask for.

Then there may be the local Acts, the contents of which are so various that I cannot deal with them here. They must, however, be carefully read as they may, with regard to the place in which you are building, utterly upset any of the law laid down in this paper. I cannot too strongly emphasise this fact. In these local Acts are usually incorporated the whole or parts of the Towns Improvements Clauses Act. Then, again, there may be by-laws, which we shall consider later on. Or, again, the education code for the time being, which has the force of law, may have much to say to the architect who is building a board school, and the Education Acts may enable him to defy the Public Health Act or similar Acts in certain respects. Or, if you are building for a railway company, there will be the special Acts laying down, it may be, further restrictions or enabling you to escape from those which apply to buildings in general. I will not enter into the questions which arise when these Acts, or when sections of Acts, or when a by-law and a statute seem to conflict. I hope to consider this matter more fully in a pamphlet which I propose to publish.

---

* A paper read before the Northern Architectural Association on January 17th.

Provisions.

The first class of negative provision for the benefit of the public is that which regulates the vista of our streets, either in accordance with a "prescribed line" under the Public Health Act, or through a "governing building" (a term which I will explain) under the Public Health (Buildings in Streets) Act. These methods differ in several important respects. The first deals only with "buildings or the fronts thereof taken down to be rebuilt or altered," and not with buildings being erected where none stood before. The second deals with new buildings, or new additions in front of, or on the top of, old buildings. In the first the line of buildings is the general line of all the houses in the same street, but depends for its very existence on its being prescribed by the Urban Authority. In the second it is not the general line of buildings at all which regulates, but merely the most backward next-door neighbour, called the "governing house," no prescribing being necessary, but consent to build forward being required. The first, the prescribing method, gives compensation and exacts no penalty, but is enforcible by the ordinary methods of injunction and indictment. The second exacts a penalty which can only be recovered before Justices of the Peace. In the case of the prescribing method, an offending building must be pulled down by the defendant if the High Court make an order to that effect. In the second, the building which projects beyond its most backward neighbour cannot be pulled down at all.

Let us consider the first or "prescribing" method under section 155 of the Public Health Act, 1875. This enacts that, "where any building or the front thereof in any street has been taken down to be rebuilt or altered the Urban Authority may prescribe the line in which" its successor "in the same situation" is to stand, and the successor (as I may call it) shall be erected in accordance with such prescription. Compensation is to be paid or tendered to the owner, the amount to be ascertained if necessary by arbitration in the usual manner. Short though this section is, almost every word of it has been a text for judicial interpretation and a cause of innumerable disputes. You may ask, "Is my structure a 'building' so as to be set back?" The answer is, "Even if your structure were only a wall 15ft. high or a cowhouse, back it must go if it is large enough and is intended to be permanent."

Then, again, you may question whether it is in a "street" for the purposes of this section of the Act. Well, if there are houses more or less continuous along one or both sides of your road, and that road is used for public carriage traffic, it is a "street;" thus, Claremont Road (Newcastle) is a "street," though on one side stretches the breezy town moor. A mere foot passage with houses on either side, such as we see in Durham or in other quaint old cathedral towns, will not be a "street," and I think, though the matter has not been clearly decided, that the road must be one which has been dedicated to the public, that is, it must be a public carriageway. My reason for this opinion is that the provisions as to the building line are provisions for the benefit of the public, and, therefore, the authority would seem to have as little right to regulate the vista of a private street as it has to choose the pattern of your drawing-room carpet.

Some Illustrated Examples.

One more question. Suppose that, as shown in Fig. 1, there lies in front of your terrace a footway, and in front of the footway a common garden extending the whole length of the terrace. Will the terrace be in the street? On the whole I am inclined to think, having regard to decided cases, that this will depend on what openings there are from the common garden into the street, and also as to whether or not the footway is public; the more nearly the terrace with common garden is assimilated to the ordinary case of houses with separate gardens opening into the street, the more likely is such terrace to be held to be in the street. An increase of the assessibility of the common garden into the street would have this effect.

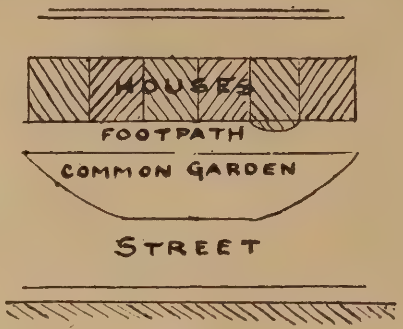

FIG. 1.

Another question, however, which has been decided by numerous cases, may arise for your consideration. You are engaged on a corner house (see Fig. 2). On one side, facing the aristocratic street, the front door is situated, while on the other side is a door for tradesmen. Is the corner house in the latter street also? There is no doubt that it can be, and probably is, but this will be to some extent a question of fact.

Then, again, what is the meaning of "taken down in order to be rebuilt and altered"? It means substantially taken down. A case which may be useful in explaining this is the case of the *Attorney General* v. *Hatch*. In this case the owner of a baker's shop, which projected beyond the building line, wished to turn it into a two-storey windowed milliner's shop. He accordingly took out the fronts of the ground and first floors, but left undisturbed the second storey, shoring it up first with wooden beams and later with iron girders. The urban authority came with their compensation money in their hands, but the owner was not to be tempted, so an action was commenced against him. In this it was held that in order to bring a building under the provisions as to the prescribed line, the front of such building must have been completely pulled down (that is, as far as the foundations), though a few bricks of the front left standing would not save the owner. Conversely, in another case it was held that a building the front of which was left up as far as the first floor cannot be prescribed for, as its front has not been pulled down.

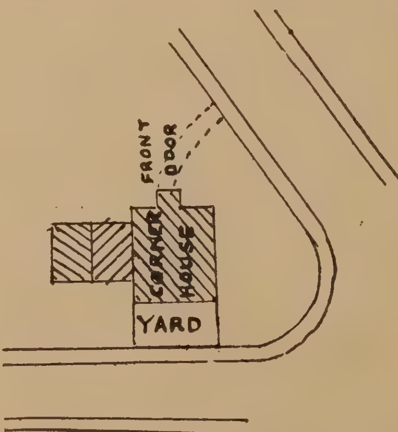

FIG. 2.

Therefore, if you want to keep your own position in a street, do not be in too great a hurry to pull down your building. Supposing you have an ugly yellow brick house which is fast going to decay, but which, on account of its forward position, commands an interesting view up and down the street and covers valuable ground. You wish to turn this into a "marble hall." You can, if you like, pull down the front all at once, in which case you will lose your position in the street. Or you can pull out the bottom part of the front and put in your marble, meanwhile shoring up the higher storeys, and then restore the higher storeys until the whole building has a new front; or you may begin on the top storey. A local authority who tried to fix you with a prescribed line would be in this dilemma. You could always say, "I have not pulled it down, it is too early to prescribe;" and also, at the same time, "I have begun to build it up; it is too late to prescribe."

Another question: Suppose you have two semi-detached houses and you pull the front of one down. Have you pulled down a whole front, or only half a front? Well, if the houses were separately occupied, and had no internal means of communication, you have pulled down a whole front and the authority may prescribe for the front that you pull down. But if you have pulled down the front wall of your house it will not avail you that you have left the rest of the building standing. Suppose, however, that you have pulled down the whole front extending, say, a foot back, can the authority prescribe a line a yard back? No, I think, certainly not. Their line cannot go back further than the site you have just vacated.

The Meanings of "Prescribing" and "Line."

Now we come to the meaning of the word "prescribing." If a surveyor authorised by the council comes along the road and points with his stick, or paces out the line, saying, "Thus far and no further shalt thou go," has he prescribed, or must he send for pen, ink and paper? He has duly prescribed and need not do so in writing. The authorities, however, must prescribe a line particularly in each case. They cannot do so by a general notice or by by-laws, though they may possibly be able, in certain special circumstances, to obtain much the same effect by by-laws as to new streets and air spaces, as we shall see.

Next, as to the word "line." It should hardly be necessary for a lawyer to teach you how to draw a line, but there is some law in this matter. In *Tear*, or *Sear*, or *Fear* v. *Freebody* (no one seems to know the plaintiff's name) the only decision as a matter of law with regard to the meaning of the word "line" was that it need not be a mathematical or geometrical line; but the case is in other ways instructive The facts were as follows:—Portland Road, see Fig. 3, ran from east to west, and had a 6ft. footway and a 28ft. carriageway. At the extreme east, on the north side of the street, was a house which plaintiff was building flush with the footpath; then adjoining it, followed, going westwards, a row of nine houses called Priory Terrace. This row stood back 11ft. or 12ft. Of these houses the first two were forward, the next five back, the last two again forward. The forward houses projected beyond the backward houses by 9in. Then came a gap of 4ft. and then two houses called "boundary cottages," standing back some 11ft. or 12ft.; then another gap of 4ft. followed by Portland Terrace, the houses in which also stood back 11ft. or 12ft. This last terrace consisted of twelve houses. The first, a wider house, standing forward; the second, a narrower house, also standing forward; then came three narrower houses, standing back; then two narrower houses, standing forward; then three narrower houses again standing back; then a narrower house, standing forward; then a wider house, also standing forward. The difference between the backward and the forward houses was 9in. The backward houses of Priory Terrace and Portland Terrace stood at the same distance back from the pathway and so did the forward houses. You thus see these buildings made quite a pretty design. The arbitrator found that each row, namely, Priory Terrace, Boundary Cottages, and Portland Terrace, had

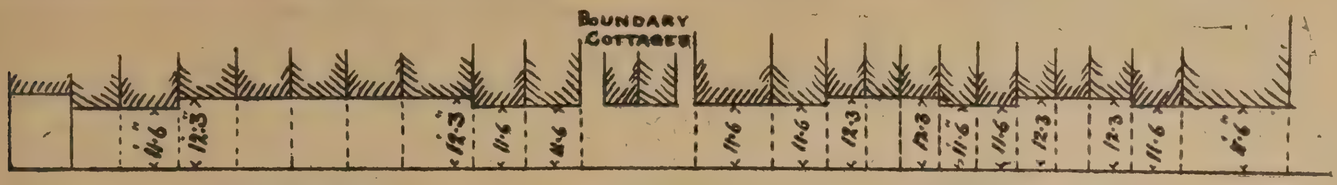

Fig. 3.—Portland Road.

a line of buildings, and also that all these rows taken together had one general line of buildings. These were the circumstances in which the judges decided that the line of buildings need not be a mathematical one. The judge also said that the object of the provisions as to line of buildings was to secure the ornamental character of the street. The Court evidently approved of the arbitrators finding. I may, however, remark two things. It was not necessary for the case that all three rows should have one line of buildings. It was sufficient that Priory Terrace, which was next to plaintiff's house, should have a general line. Secondly, the question whether houses have a line is a question of fact.

Another rather curious case. A owned a pair of semi-detached houses, and pulled one down; to the left lay the other semi-detached house, and beyond it to the left a row of public buildings, which retreated further back. To the right of A's houses stood a row of buildings in line with them. You would have thought that A could have built on the same site as before, since he had one house on one side and a whole row on the other to keep him company in a forward position. But no! He had to put his rebuilt house back to the line of the public buildings, thus making a most irregular line, for on the left there would thus be a row of public buildings standing back, then there would come A's untouched house standing forward, then his rebuilt house standing back, then the row of houses standing forward. The case, however, is a Scotch one, and this may be the Scotch idea of a straight line. The reason why it was so decided was that A's two houses were for this purpose treated as one building and the untouched one was only considered as half a building and therefore ignored as a factor in regulating the building line.

Now, suppose that next to the house you have demolished, or the front of which you have taken down, there stands, not a row of houses, but a row of old sites, with, perhaps, a stone or two standing above their naked foundations. Can these interesting ruins be taken into account so as to set the line of buildings either forward or backward? Yes, they can, unless the owner has clearly abandoned all intention of rebuilding on these foundations. A mere delay, however, of two or three years will not be evidence of intention on his part not to rebuild.

Now suppose, on the other hand, that, next to the house the front of which you have taken down, a builder is putting up a row of unfinished houses. Your business will be to begin to rebuild before he has finished or nearly finished; for an unfinished house cannot, according to reported decisions, be a governing house for the purposes of the Public Health (Buildings in Streets) Act, and I apprehend that neither can it be taken into consideration in prescribing the line of buildings under the Public Health Act. (Of course, these houses must be on new foundations or they will come under the previous case.) Before the builder has finished his houses the authority cannot make you keep in line with them. After you have begun, the authority cannot prescribe for you at all. You will thus escape their attentions.

The urban authority can prescribe a line but the rural authority can only do so if they obtain powers from the Local Government Board. You may, therefore, find that, owing to the locality in which you are building, you are free from anxiety on this point. Then, as to the compensation. It need not be tendered when the line of building is prescribed. The amount is fixed by arbitration in the usual way. It is for you to consider whether it will be better to accept the compensation offered or wait for the arbitrator to award a greater or less sum, or to refuse the compensation and go to the expense of the piece-meal demolition and restoration which I have suggested.

If, in spite of the luring bait of compensation, you refuse to set back your building after a proper prescribing, the urban authority has two methods of punishing the owner and builder, but cannot punish the architect. They may get an injunction to restrain the continuance of the offending work, or to command the offenders to pull it down, but they cannot take the law into their own hands and pull it down themselves, except where it actually encroaches on a public way. They may also indict the owner or builder criminally. They can thus have his building pulled down by one Court and punish him in another.

Council for the defence may have several ways of meeting the action or prosecution. He may defend on the merits by denying that the structure the front of which was pulled down, or the structure put up in its place, was a building, as, *e.g.*, if it was a small railing. Or he may show that the street in which it stood was not a "street" for the purposes of the prescribing method, or that it was not "in" that street. Or he may bring witnesses and adduce arguments to show that the building or its front was never really pulled down, or that you did not vacate the site as far back as the authority wished to set you. As he may show that the line has not been prescribed in time, in what circumstances will you allow him to plead this point? Well, if you have done anything in the way of rebuilding, for instance, have put in fresh foundations or begun to build on the old ones, it will be too late for the authority to set you back. The principle is that the authority must not be trying to get you to pull down work innocently done in front of the line before they prescribed it, and waste your labour. You can say, "Had I known, I would not have rebuilt in front of the line." In the case that follows we shall see that even where you have begun to build behind the line previously to its being prescribed, the authority cannot waste your labour by not, indeed, asking you to physically demolish it, but by wishing you to abstain from doing that which is necessary in order to make your work of any use. You can say, "Had I known, I would not have built as I did." The principle is the same. Suppose, for instance, you have pulled down, and then, without having built anything, not even a foundation on the site of your demolished front, you have put up at the back of that site a building which absolutely requires some building or other in front of it as a necessary compliment. For instance, you have pulled down a building, and the site of the front of such building still remains vacant, but you have already begun to build a nave of a church at the back, and the authority try to cut off the chancel and vestry which you intend to build in front of the nave by prescribing a line, and thus forbidding you to build on the site of the demolished front. The urban authority are not entitled to do this. They have prescribed too late, for though you have not begun to build on the front site, you can truly say to them, "You let me put up a building, and then try to make it useless by cutting off a necessary adjunct. I should not have put it up at all if I had known you would do this." But if, for instance, you have begun work on a school at the back of the vacated front site which the authority wishes to keep open, and the buildings which you wish to put up in front of it and of the prescribed line are merely annexes, such as a lavatory, which could either be dispensed with or put elsewhere, and which, of course, I am supposing you have not yet begun to build, the local authority can in this latter case prescribe so as to cut off the site of your intended annexes. Delay will be fatal to the authority, though they have not been guilty of negligence, and though the builder had good reason to know that they were thinking of prescribing a line.

Your counsel, again, might be able to show that before you began to pull down you had good reason, not merely from the inaction, but from the conduct of the authority, to consider that they had no intention of prescribing a line, and that on the faith of this you were led to act as you did in pulling down. And, of course, if, before you began to pull down, you told them where you were going to rebuild, and they approved of your intention, they could not but lose their case. It may, therefore, be wise, and will usually be obligatory, before you pull down the front of a house to tell the authorities where you intend to rebuild. It has been decided, however, that the local authority could prescribe a line for a builder after having just permitted another builder to erect a house in advance of the line.

We will now presume that the local authority has been punctual in the proper sense of the word—that is, neither too early nor too late—that you have come under the provisions as to prescribed line, and that they have drawn the line correctly. Can they keep the owner waiting an indefinite time for the writ, or, perhaps, for the policeman who is to lead him off? Well, of course, if they are suing to prevent a building being put up, they must do so before it is put up, otherwise there is no limit to the time they may wait. Counsel for the defendant, however, will not omit to dwell on this delay with all the eloquence at his command. If the case goes against you, can you appeal? If the action is for an injunction you can, but, if the offender is indicted, there is no appeal except for technical defects.

I said that the authorities have no other remedies but the above, and I here repeat it. They cannot sue you summarily. They cannot themselves pull your building down. If they want it down they must go to the High Court. It is true that the courts have held that an authority may refuse to approve your plans, on the ground that they have contravened provisions other than those contained in the by-laws; but what of that? Disapproval is of itself merely a "brutum fulmen" The legislature only requires approval or disapproval to be shown in order that the builder may not be in the dark, but may have a danger signal before the authority proceeds.

You may, however, have also brought yourself under the Public Health (Buildings in Streets) Act of 1888, or you may have broken some by-law in your rebuilding. In such case the owner will be liable to other proceedings as well.

Setting Back Houses.

This brings me to the question whether a local authority can set houses back by making by-laws as to new streets or new buildings. Can they, by by-laws as to new streets, set back an old demolished building, the whole of which you have pulled down to the ground floor? It has been held that they cannot by by-laws do, without compensation and by a penalty, what a section of the Act has allowed them to do with compensation. But, for all this, if in building your demolished house, or, at any rate, in building a house where none ever stood before, you proclaimed an intention of laying out a new street, then you may come under the by-laws. You will in such case be unable to build, if, owing to the position of the house you intend to put up, you cannot do so without curtailing the street required by the authorities. They must, however, show that you had this intention of laying out a new street, either from plans which you have shown them and have begun to carry out on the land, or from work actually done in making or altering the boundaries of a road. They must also show that you would encroach on the actual footway or carriageway of the required street.

Next, can they set back an old demolished building by by-laws as to air space. Well, if you have not contented yourself with pulling down the front, but have also pulled down the rest of the house to the level of the ground, I certainly think they can. Any disobedience to by-laws renders the offender liable to summary penalties, and your building will be pulled down and the expenses of removing it be recoverable against the owner. There is a method of setting back old buildings, and that is by conpulsorily buying the sites, but with this we are not concerned. Now we come to the Public Health (Buildings in Streets) Act, 1888, which, I may remind you, deals with new buildings as well as old ones, and only applies to urban districts or to such rural districts as have obtained leave from the Local Government Board to enforce it. In this last respect it resembles the prescribing method. Under the above Act you may not without the written consent of the urban authorities put up a new building, or put up a new addition in front of an old building, or put up a new addition on the top of an old building, in such a position that the new building or the new addition will project in front of the main front wall of that building next to you which stands furthest back and is in the same street. I shall speak of your neighbour's building as the "governing building."

What additions will be forbidden? Any addition that comes too far forward, if it is large enough. A small wall and a small conservatory would be legal; a large wall or a large conservatory would be illegal. What kind of building must your neighbour possess for it to be a governing building? It must I think be something in the nature of a house described by the Act as having a "main front wall." As to what is a street, we have already discussed this matter and we have also observed that a corner house can be in two streets.

Suppose the alleged governing house stands, for instance, 64ft. back from the street; it cannot prevent you from adding to your building, as it can hardly be said to be in the street for the purposes of the Act. Then, again, suppose that your house is in an old street and someone makes a new and wider street in continuation of this old street. Can you put up an addition which would be in front of the houses in the wide new street? Yes, certainly; the two streets are distinct. Again, it has been held that a wide street of palaces and a narrow back street, though one formed a continuation of the other, are not the same street. As to whether a building is in the same street, and also as to what is the "main front wall," we may refer to a Bristol case, illustrated by Fig. 4. In this case there was a shop B which the owner brought forward to near the roadway. Next to this shop on the other side of the lane, and of a small area, was the wing A of the Blind Asylum. This wing stood back a considerable distance from the road. Then came a large courtyard which ran a very long way back to the main body of the asylum. Beyond this courtyard and right up to the road came the other or left wing of the asylum. It was held that the front of the wing A was not the main front wall of the Blind Asylum, so as to keep the owner of the shop from building forward. The Court said that the governing "building must be looked at as a whole, its character, position and distance from the house or building which is being erected must be considered. A particular wing must not be selected. Nor are two buildings necessarily in the same street because one faces the same street or a continuation of the same street as the other." In another case as to main front wall it was held that a house which turned its side to the street (see Fig. 5) could not be a governing house. The side wall was not a main front wall.

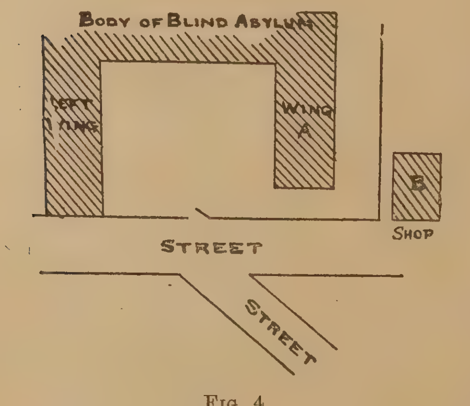

Fig. 4.

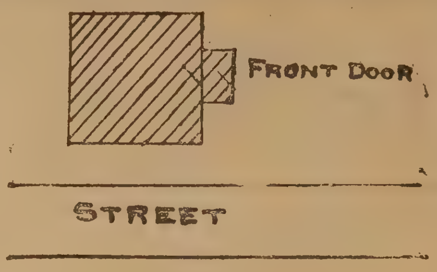

Fig. 5.

What is to be done then if you want to build your house forward or add to it some addition which would project? The consent in writing of the surveyor ought to be obtained, and it would be well to persuade him to enter it on the minutes of the Council, but no consent given by word of mouth or presumed from the conduct of the surveyor or the authority can avail you. In the absence of this consent there may be another method which I indicate below.

With the penalty I will not deal now, as the recovery of penalties forms the subject of a subsequent part of my paper. Suffice it to note that there is a continuing penalty of 40s. a day or less, which does not begin till the day after notice that you have infringed the Act and which must stop on the anniversary of the original offence when you first made any projection worth considering. Also note that a building put up in breach of the Public Health (Buildings in Streets) Act cannot be pulled down without your consent, except so far only as it projects into the footpath or roadway. A consideration of these two facts leads me to suggest that it may be worth your while to set your building forward, where, owing to circumstances, you are morally justified in not complying with the Act in this respect. Your building cannot be pulled down and the owner cannot be made to pay more than £730 and costs, and the extra land you gain may be worth more than this.

Another variety of the precept "thou shalt not build" confronts the architect in the case of open spaces, highways and streets. It rarely occurs to the man who perambulates the park or the public street or highway to ask, "To whom does this belong?" A private man or body of men may have the freehold, and always in the case of streets and highways does possess it. Their rights must be respected, for they own the land up to the sky, and, subject to any rights of subsoil being in some other private person or company, they own the soil down to the middle of the earth. The smallest freeholder may justly swell with pride as he contemplates the vastness of his estate. Thus, even the local authority are not complete lords of their own streets. They cannot authorise the laying of trade pipes, or make tunnels, for instance, for subways and similar works without the freeholder's leave. Their sole right is to lay gas pipes, water mains, sewers, or electric wires, and to protect these. Or a local authority may, in the case of open spaces, be either the freeholder or the leaseholder, and have rights as such. The rights of these freeholders and leaseholders, whether private men or local authorities, must be borne in mind when you wish to put out a projection overhanging, or to excavate a tunnel or cellar undermining, an open space, highway, or street; and I will presume that you have respected these rights. We pass on to the

Rights of Easements

which are vested in local authorities, that is, to those rights of the public to use and enjoy the open spaces and to promenade along the pavement or to drive carriages or haycarts along the streets or highways without let or hindrance, and to have their gas and water mains, or their electric wires and their sewers, undisturbed by underground tunnels and vaults.

If you wish to overhang an open space, highway, or street, you need not get the consent of the local authority in their capacity of guardians of the right of way; but you must not obstruct or endanger the public in their use of such open spaces or ways. Thus, in the case of a street or highway, your projection or bridge, if over the pavement, must be above man's height, and if over the street must be above the height of such vehicles as are likely to "use the street as a street." Thus it must be possible to take a haycart along the road, and perhaps a fire-escape. Nor must you put a cornice which might drip over passers-by on a rainy day.

If you wish to tunnel under an open space you must not disturb the soil so as to lessen the amenities of the park, and in the case of a street you must leave undisturbed such portion of the subsoil as the authority may need for their gas pipes, sewers, water mains, or electric wires, and not only must these be respected, but the whole stratum in which they lie must be treated as sacred. As regards tunnels, vaults, or cellars under the carriageway of any street of the urban authority (and this would include a bridge other than a county bridge, but not a main turnpike road), you can only make such excavations with a written consent of the local authority; such consent is only valid if in writing, and cannot be presumed from conduct. For breaking this rule there is a lump penalty, and a daily penalty recoverable before justices of the peace. The authority may also remove the building, and recover the costs of doing so before the same tribunal. There may be other bodies having statutory or other rights in the surface of the street and a portion of the subsoil, and these you must respect. In the case of disused burial grounds, you must not disturb the dead, unless you get special powers to do so.

If you wish to build upon the public park or to overhang it so as to obstruct passage, you must get the consent of the local authority, but, even if you are employed by them, they have a sacred trust for the public, and only such buildings as conduce to recreation can be placed thereon. You cannot even by their orders put up a town hall or a school, but you can put up a conservatory, a public library, or a museum, and, as it seems to me, such buildings as a boat-house, shelters, refreshment and other kiosks, baths, gymnasiums, and other places for indoor exercise, monuments, and rooms for entertainments, or a gatekeeper's lodge. No building of any kind, not even a bandstand, can be placed in a disused burial ground. Statues and monuments may be put in the streets only if the Public Health Act Amendment Act is adopted. (No freeholders' or leaseholders' consent can enlarge these powers.)

Before leaving these sins of commission, it may be well to consider the case of brick-burning. This is a nuisance at common law if it interferes with the amenities of the neighbourhood, but it is not subject to the technicalities of the Public Health Act regarding the nuisances or offensive trades. It is punishable by the ordinary methods if it does cause a nuisance.

Now for a few sins of omission against the public. You have a quarry by the roadside. Have you fenced it? If not, beware of the complicated technicalities of sections 91 to

111 of the Public Health Act, 1875. You are erecting or repairing a building or the front of it near the public street and have not remembered to put up a hoarding, nor a hand rail, or red lamp, as required by the Towns Improvements Clauses Act. If so, beware of the urban district or the town council. In any case these hoardings must not impede traffic.

Or the builder may have left a heap or an excavation for an unreasonable length of time in the street, and may have omitted to light such heap or hole at night. This is an offence under the Towns Improvements Clauses Act. Besides all these the owner may be liable for commissions or omissions under a local Act, and if there is one it may be well to see that proper water spouts are put on buildings to prevent their dripping into the streets, so that while the indignant passer-by is looking up to discover where your waterfall comes from he does not fall into your unfenced cellar. Lastly, the doors of your building must be made to open inwards, unless it is a public building with special leave obtained. Any by-laws also must be carefully attended to.

New Patents.

These patents are open to opposition until March 6th.

1899.—Expanded Metal.—2,672. F. H. PITKIN and J. THOMPSON; both of Chicago, U.S.A. The machine consists of a number of rotary cutters (driven through worm gearing and arranged in series), pressure rolls and stationary knives. By these means the sheet is simultaneously cut and expanded and the operation can be carried on continuously, the sheets being passed in flat at one end and coming out finished at the other. It is claimed that there is no danger of the metal fracturing when treated by this machine.

Stone-sawing Machinery.—3,796. G. ANDERSON, Carnoustie, N.B. The diamond circular saw is mounted on a sleeve that can slide on the shaft (horizontal), the position of the sleeve being alterable whilst the saw is running, by means of cross-beams, pulleys and chains, thus facilitating the adjustment of the cut. There are top and bottom guards to prevent the water and sand flying about, and any diamonds that become loose are caught in a trough. Hardwood blocks are provided to reduce shaking of the saw. The stone is mounted on a table, having rollers, operated by gear.

Sewage Filters.—4,460. C. J. WHITTAKER and W. C. BRYANT; both of Church, Lancs. The filters are polygonal or circular in form and the spaces between act as shafts through which air can be drawn into the bottom channels or drains. There is also an air shaft in the centre of each filter. The bottom is of concrete, sloped. Additions can be made to filters of this kind without any diminution in the efficiency of the aeration.

Acetylene Gas Generators.—22,516. A. STERN, Berlin. The delivery pipes from the various generators enter a tank which has a small depth of liquid at the bottom. The ends of the pipes dip into this slightly, thus forming a seal. There is an outlet at the top of the tank leading to the main pipe, and near the bottom is an overflow pipe to keep the water-level constant. The main feature is that the ends of the pipes are only immersed slightly.

The following specifications were published on Saturday last, and are open to opposition until March 10th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—176, NICOL, means of cutting mitre and other angle joints. 1,805, WILLIAM DICKEN, WILLIAM WADE, and LEONARD LUMSDEN GRIMWADE, continuous muffle furnaces or kilns. 2,186, BOND, apparatus for generating, storing, and supplying acetylene gas. 2,244, BAER, device for securing the plinths or washboards of walls. 2,798, HAMMOND, roofing tile. 3,005, LANE, electric switches. 3,109, RUTTENBERG and VAN ZANTEN, walls and ceilings, or covers or ornamentation therefor, and method of making them. 3,163, BROWNING, smoke consumer and fuel economiser. 3,930, WESTWOOD, bearings for girders, beams, trusses, &c. 4,216, GROVES, dust refuse and similar carts or waggons. 4,252, RUNGE, process of and apparatus for burning cement, lime, and the like in blast furnaces. 4,644, MACTAGGART and SCOTT, hydraulic pumps. 4,715, TIMINGS, manufacture of metal handle knobs and other metallic knobs. 4,750, MILWARD, chimney cowl and ventilator. 5,504, LINDSAY, construction of Banbury or Stock locks. 7,696, WEBB, handles for planes and other tools. 10,041, ROBERTS, means or apparatus for breaking or crushing coke, lime, and the like. 15,977, HIGGINS and SANDILANDS, apparatus for the production of acetylene gas. 19,070, DREW, guards for circular saws. 21,258, CODE AND KNUDSEN, adjustable pulley gear. 21,805, HADDAN (*Plano Manufacturing Co.*), chains. 22,085, BOULT (*Nieske*), the treatment of materials for fireproof and preservative purposes. 23,179, TURNER, gas generating apparatus, and more particularly means for generating acetylene gas. 23,181, MEYER, surface decorations and ornamentations. 23,309, SMITH, acetylene-gas generators. 23,548, EHRHARDT, portable shed. 23,937, ADOLFSSON, acetylene-gas generating apparatus. 23,964, CZERNY AND SCHLIMP, hydraulic presses for use in the manufacture of blocks of artificial stone.

Keystones.

At Marlborough College a new reading room, 90ft. by 30ft., several classrooms and a racquet court have been provided to commemorate the jubilee of the foundation of the college.

Art Gallery Destroyed by Fire at Newcastle.—The old Art Gallery in Grainger Street, Newcastle-on-Tyne, was burnt out on January 23rd. It was opened in June, 1839 and was designed by Mr. Richard Grainger, and included the rooms of the Arts Club, a café, restaurant, and the Vaudeville Theatre. The damage is estimated at about £40,000.

M. Rodin, the eminent French sculptor, will enjoy an exceptional distinction in the summer of this year. The greater part of his statues and reliefs will be brought to Paris and formed into a special exhibition in a building erected exclusively for their reception upon a site in the Rue Jean Goujon, in the Champs Élysées. M. Sortais, a young French architect who has not long returned from the Villa Medicis, has been selected by M. Rodin to design it.

Wesleyan Chapel Building.—The forty-fifth annual report of the Wesleyan Chapel Committee states that in addition to £369,441 expended on new erections and in reductions of debt, official sanction has been given to a further expenditure of nearly half a million. The scheme includes the following:—122 new Wesleyan chapels, estimated to cost £304,377; 21 ministers' houses, to cost £16,904; 168 enlargements and alterations, estimated to cost £92,415. These, with other projected schemes, bring up the total expenditure to £455,053.

Battersea Polytechnic.—The prizes and certificates gained by the winning students at this polytechnic were distributed on Wednesday evening last by Lord Russell of Killowen. The report showed an increase in the number of students, while the successes obtained were greater than in any previous year, the total value of the scholarships won by day and evening students being £1,250. The Principal stated that over 1,100 students presented themselves for examination, of whom 769 had been successful—twenty-three passing in honours and thirty-four gaining medals and prizes.

Glasgow Institute of Architects.—The Alexander Thomson Memorial Travelling Studentship of £60 has been conferred upon Mr. L. Rome Guthrie, trained in the office of Mr. William Leiper, R.S.A.

Municipalisation of Gas Works.—During the past year twelve gas undertakings in this country have been transferred from companies to local authorities, bringing up the total number of such transfers for the past twelve years to fifty.

The Rooms at the Palace of Versailles are proposed to be filled with carefully-made models of Louis XIV. furniture, as towards the close of last century most of the Versailles furniture was sold, and has been widely dispersed over Europe and America.

Glasgow's New Art Galleries. — On Saturday afternoon last about ninety of the High School constructional students inspected the new art galleries at Kelvingrove, now approaching completion. Mr. George Monteath conducted the party.

The Criterion Restaurant, Piccadilly, is being remodelled. American marbles now cover the walls of the buffet (which is 143ft. long and is supported by a series of arches and columns ornamented with plaques of lapis-lazuli and malachite), being inlaid with mosaic in gold and mother-of-pearl. The restaurant was opened in 1873.

A Judge on the Housing Problem.—Judge Emden, in a recent housing case at the Lambeth County Court, said: "The root of the housing difficulty in London is that persons who almost invariably describe themselves in ejectment notices as 'gentlemen' buy small house property as speculators, and put it in the hands of agents with directions to get as high a rate of interest as possible."

Ruskin's Portrait and Bust. — The trustees of the National Portrait Gallery, having already in their possession a portrait of the late Mr. John Ruskin, drawn in chalks by G. Richmond, R.A., and also a terra-cotta bust of the same, modelled by Sir J. E. Boehm, R.A., have decided to place these two portraits immediately on exhibition in the galleries, suspending their usual rule as to the expiration of ten years from the date of a person's decease.

Church Crafts League.—The following are on the provisional committee of the new Church Crafts League (referred to on page 378 of our issue for January 17th):—The Bishop of Rochester, Canon Scott Holland, Sir W. B. Richmond, R.A., Canon Rhodes Bristow, Mr. W. Goscombe John, A.R.A., Canon Gore, Mr. Henry Holliday, Rev. Percy Dearmer, Mr. Conrad Dressler, Mrs. Rupell Barrington, Mr. A. G. Walker, Hon. Mabel de Grey, Miss M. Lowndes and Miss Emily Ford.

Cartwright Memorial Hall: Builders' Grievance.—Combined action is being taken by the various sections of the building trade in Bradford to obtain a modification in certain requirements imposed by the Corporation with regard to the Cartwright Memorial Hall. The grievance consists of a stipulation that firms submitting estimates will have to give one tender for all trades. Although the Cartwright Memorial Hall Committee have decided to allow the successful firm to sublet the various contracts locally, it is contended that a departure has been made from the usual practice. A petition is to be presented to the Corporation.

Funeral of Mr. Ruskin.—On Thursday last the body of the late Mr. John Ruskin was buried at Coniston Church. Among the numerous flowers was a wreath from Her Majesty the Queen; Mr. G. F. Watts, R.A., sent a cross of Greek laurel, and on the accompanying card Mrs. Watts had written: "It comes from our garden, and has been cut before three times only—for Tennyson, Leighton, and Burne-Jones." The coffin was covered with a pall of hand-spun linen, woven at the Keswick School of Art. It had a border of red roses and rosebuds and bore the emblem of St. George and the legend "Unto this last." Simultaneously with the service at Coniston, a memorial service was held in Westminster Abbey.

TAKING OUT QUANTITIES.

AN IMPORTANT CASE.

THE case of Restell v. Nye was heard before Mr. Justice Mathew on January 23rd in the Queen's Bench Division of the High Court of Justice. The defendant was employed by the plaintiff as architect in connection with the building of a bungalow for the plaintiff in Sussex. By the terms of the employment the defendant was to be paid by the plaintiff for "plans, specifications, and supervision of works" 5 per cent. upon the amount of the expenditure, travelling and out-of-pocket expenses to be charged extra. In accepting the defendant's offer in these terms the plaintiff wrote that the charge was to be an inclusive charge covering everything. The defendant entered upon the work. He prepared a specification on which tenders were obtained, and included in it a provision that surveyor's charges for bill of quantities should be 2½ per cent. on the amount of the estimate, and for drawings, &c., £10 10s. The defendant himself prepared a bill of quantities, and obtained a tender from some builders at Brighton for the erection of the bungalow for £1,790. The tender was accepted, and a contract was signed by the plaintiff, which provided that the price should be paid by instalments upon the defendant's certificates, and that his final certificate should be conclusive evidence that the builders were entitled to receive payment of the final balance. The work was completed, and the plaintiff paid the contract price, together with the cost of certain extras on the defendant's certificates. The defendant was paid by the builders 2½ per cent. on the contract price for taking out the quantities and the ten guineas for the drawings. The plaintiff alleged that the receipt of these payments by the defendant was a breach of the defendant's term of employment, and was, alternatively, a secret profit made by the defendant in the course of his employment. The defendant contended that the ordinary course of business had been followed, and that the plaintiff was fully aware that the cost of taking out the quantities was not included in the defendant's charges for acting as architect to the work. The second head of the plaintiff's claim was for damages for negligence on the part of the defendant. The plaintiff's case was that the defendant had omitted to check the builders' accounts with due skill and diligence, and had passed as extras works included in the contract and had certified for sums improperly passed. These allegations were denied by the defendant. Since the action was begun the plaintiff had died, and his executors had been substituted as plaintiffs.

Mr. Justice Mathew, in giving judgment, said that the defendant alleged that the terms of his employment by the plaintiff were that his charges were only to cover the ordinary work of an architect, apart from the work of taking out the quantities. The course of business with regard to taking out the quantities was that the builder employed some one to take out the quantities. The builder affixed his own prices to the quantities, and he added to the amount of his tender the fee of the quantity surveyor, and in the event of the tender being accepted that fee was included in the first certificate given by the architect. It was not usual in London for the builder to employ the architect to take out the quantities, but it was said that in the country it was permissible, and that it was not considered that there was anything objectionable in that course being followed. In the present case the defendant, who was the architect to the work, acted as quantity surveyor, and the amount of his fee was included in the sum for which the defendant, as architect, gave his first certificate. Some time afterwards the plaintiff discovered that this had been done, and he claimed the benefit of the payment on the grounds that by the terms of the employment the defendant's charge was to be an inclusive one. On the other hand, the defendant said that the agreement contained in the correspondence was confined to his ordinary duties as an architect, and that the builder might, if he had chosen, have employed anyone else to take out the quantities, which, it was admitted, was a necessary thing to be done. His Lordship came to the conclusion that the agreement between the plaintiff and the defendant did not cover the cost of taking out the quantities; but his Lordship felt compelled to add that he did not think that the defendant had acted as an honourable man, because he had concealed from the plaintiff the fact that he was making this arrangement. The plaintiff was, unfortunately, now dead, but the learned judge was satisfied from the correspondence that the defendant did not disclose to the plaintiff the arrangement with the builder as to taking out the quantities. It was conceivable that if the plaintiff had known of it he might have disapproved. With regard to the other part of the case, his Lordship was satisfied that the defendant had been guilty of negligence which had benefited the builder at the expense of the plaintiff. His Lordship was clearly of opinion that damages were not recoverable. The principle of law applicable to the case was that when two men employed a third to settle a dispute they were bound by what he decided. The parties were supposed to have satisfied themselves as to the third person's skill and care, and they were not allowed to say, after his decision had been given, that he had acted negligently or with want of skill. The result was that there must be judgment for the defendant, but without costs.

ARCHITECTURAL ASSOCIATION.

A MEETING of this Association took place last Friday evening at No. 9, Conduit Street, the president, Mr. G. H. Fellowes Prynne, F.R.I.B.A., in the chair. The minutes having been read and confirmed, Mr. Prynne announced with great regret the decease, which occurred suddenly on Monday, January 22nd, of Mr. William White, F.S.A., F.R.I.B.A., who was president of the Association from 1868 to 1891. He referred to him as one who was always enthusiastic in his work, and one of the first in the Gothic Revival movement. Mr. Prynne also referred to the death of Mr. John Ruskin, whose loss, he said, perhaps to them as architects, they felt more than workers in any other kind of art. Ruskin was one who really loved their art as an art. His "Seven Lamps of Architecture," the ideas of which were elaborated in "The Stones of Venice" and also his other books, had inspired the public more with the true love of architecture than any other works in the past century. He would advise students to read the works of Ruskin, who seemed to be thoroughly overwhelmed with that perfect truth of Nature's works. His exaggeration, if a fault, was a fault on the right side; when he wrote those books, he was surrounded with a great degradation of all the arts. In his Lamps of Truth and of Sacrifice he brought out the very highest ideals it was possible to have in art. Behind all he wrote there was that deep sincerity, that deep feeling of love of what he was writing. The following gentlemen were then elected members of the Association: Messrs. A. N. Campbell, J. T. Burt, T. L. Dale and J. W. S. Humphreys Davies; after which a paper on "Cast Iron," reported in our supplement this week, was read by Mr. W. R. Lethaby.

New Companies.

Warner, Marshall and Co., Limited.

This company was registered on January 19th by W. H. Milne, 11, Hart Street, Bloomsbury, W.C., with a capital of £3,000 in £1 shares. Object, to carry on the business of auctioneers, surveyors, land and estate agents, &c. Registered without articles of association. Registered office: 11, Hart Street, Bloomsbury, W.C.

Castle Donington Brick Co., Limited.

This company was registered on January 18th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £2,500 in £10 shares, with objects as indicated by the title. The first directors (to number not less than three nor more than seven) are W. S. Eaton, G. T. Eaton, J. G. Shields, T. Webb, G. Welch and F. E. Burton. Qualification, £150. Remuneration as fixed by the company. Registered office: Castle Donington, near Derby.

Quarry Waste Development Company, Limited.

This company was registered on January 16th by Aylward and Cobbett, 16, Clifford's Inn, E.C., with a capital of £1,000 in £1 shares. Object, to acquire from G. M. Callender and carry on the business of a consulting brickworks' engineer carried on by him. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers. Qualification, twenty shares. Registered office: 11, Victoria Street, S.W.

Smoke Preventer and Fuel Economiser Limited.

This company was registered on January 18th by Budd and Co., 24, Austinfriars, E.C., with a capital of £300,000 in £1 shares, 100,000 of which are preference and 200,000 ordinary. Object, to adopt and carry into effect a certain agreement relating to improvements in inventions for the prevention of smoke, economisers of fuel, or the production of increased heat in boilers or other furnaces and fires, stoves, lamps; and in particular to acquire from J. Alves, of 131, William Street, Melbourne, in the colony of Victoria, the letters patent for Great Britain numbered 4,910, for improvements in and relating to fire bridges for steam boilers and other furnaces, and to develop, deal with, work, and turn to account the said inventions. The first directors (of whom there shall be not less than three nor more than seven) are M. Guthrie, H. Macdonald, J. Alves, J. McLaren and A. Anderson. Qualification, £250. Remuneration, chairman £300, ordinary directors £100 per annum each, to be increased according to profits.

Asbolith Flooring Company, Limited.

This company was registered on January 18th by Heath and Co., 3, New London Street, Mark Lane, E.C., with a capital of £20,000 in £1 shares. Object, to acquire from A. Reiner the benefit of an invention by O. Kraner for a material for making floors, ceilings, &c., and to manufacture and deal in the said material. The number of directors is to be not less than three nor more than seven; two of the first are to be nominated by A. Reiner and the others by the subscribers. Remuneration as fixed by the company. Registered office: Dashwood House, E.C.

Mitchell Bros., Shalford, near Guildford*	14,464

* Accepted.

HEREFORD.—For pulling down and rebuilding King's Head Hotel, Hereford, for the Hereford and Tredegar Breweries Company, Limited. Mr. G. H. Godsell, F.S.I., architect, Hereford:—

Beaven & Hodges...	£3,643 0
James Davies	3,562 0
W. Bowers and Co.	£3,498 10
W. P. Lewis and Co.*	3,480 0

*Accepted. [All of Hereford.]

HEREFORD.—For rebuilding the Imperial Tavern, Hereford, for the Hereford and Tredegar Breweries Company, Limited. Mr. G. H. Godsell, F.S.I., architect, Hereford:—

Building Contract.

J. Davies	£4,946 4 6
Beaven and Hodges	4,902 15 0
W. P. Lewis and Co.	£4,794 0 0
W. Bowers and Co.*	4,694 2 0

Decorating, Painting and Plumbing.

Alfred Dutton ...	£525 0 0
H. Barber	479 0 0
J. B. Vaughan*	£433 8 6

*Accepted.

HEREFORD.—For pulling down and rebuilding the "Three Crowns" Hotel, Eign-street, Hereford, for the Hereford and Tredegar Breweries Company, Limited. Mr. G. H. Godsell, F.S.I., architect, Hereford:—

Building Contract.

W. Bowers and Co.	£3,010 0
W. P. Lewis and Co.	2,949 10
Beavan and Hodges	2,940 15
James Davies* ...	2,768 0
Reuben Taylor ...	£2,745 0
W. Powell	2,697 0
C. Cooke. † Withdrawn	2,160 0

Plumbing and Decorating.

J. C. Vaughan	£379 0
H. S. Barber*	£360 0

* Accepted.

[All of Hereford.]

HEREFORD.—Accepted for alterations to Mitre Hotel, Hereford. Mr. G. H. Godsell, F.S.I., architect, Hereford:—

James Davies, Hereford	£595 4

HEREFORD.—For the erection of mineral water works and beer stores, for Mr. F. W. Allen, Black Swan Hotel, Hereford. Mr. G. H. Godsell, F.S.I., architect, Hereford:—

R. Andrews and Son...	£865 0 0
James Davies ...	824 10 0
W. P. Lewis and Co.	£792 0 0
W. Bowers and Co.*	751 17 6

[All of Hereford.]

*Accepted subject to deductions.

OSWESTRY.—For extensions of Market Buildings, construction of an underground convenience, and other work. Mr. G. William Lacey, Borough Engineer and Surveyor. Quantities by Mr. A. Bremner, Colwyn Bay:—

Jones and Evans	£5,794 12 0
E. H. Nicholas...	5,751 3 6
Wm. Felton ...	5,495 11 9
Jabez Higgins ...	£5,188 12 1
W. H. Thomas* (Oswestry) ..	4,990 11 9

[Borough Engineer's Estimate ... £5,700.]

*Accepted.

PRESTON WYNNE (Herefordshire).—Accepted for the erection of new farm building at Lower Town Farm, Preston Wynne, Herefordshire, for the custos and vicars of Hereford Cathedral. Mr. G. H. Godsell, F.S.I., architect, Hereford:—

A. Newbold, Bromyard	£755

SOUTHEND-ON-SEA.—For the erection of the Nelson Hotel, Prittlewell, for Mr. J. Berry. Messrs. Greenhalgh and Brockbank, architects, Bank-chambers, Southend-on-Sea. Quantities by the architects:—

Lyle Co.	£4,675
Shelbourne and Co. ...	3,706
Davis and Leaney ...	3,637
Dupont	3,668
West	3,447
Whur...	£3,190
Davey and Son, Queen's-road, Southend*	3,147

*Accepted.

WEOBLEY (Herefordshire).—Accepted for the erection of new stables at Weobley Vicarage, Herefordshire. Mr. G. H. Godsell, F.S.I., architect, Hereford:—

W. Gibbons, Weobley	£242

CONTRACTS OPEN.

THE Corporation of Middleton invite TENDERS for the BUILDING of their ELECTRICITY WORKS in accordance with plans and specifications prepared by Messrs. LACEY, CLIREHUGH and SILLAR, of 2, Queen Anne's Gate, Westminster, and 78, King-street, Manchester, Electrical Engineers to the Corporation. Plans, sections, &c., may be seen, and specifications, quantities, and form of Tender obtained at my Office on payment of One Guinea, which will be returned on receipt of a bonâ-fide Tender.

Tenders on the prescribed form, with quantities fully priced out, must be properly sealed and endorsed "Tender for Electricity Works," and delivered at my Office not later than WEDNESDAY, FEBRUARY 7th, 1900.

The Corporation do not bind themselves to accept the lowest or any Tender.

FREDERICK ENTWISTLE,
Town Clerk.

Town Hall, Middleton,
January, 1900.

HUNSLET UNION.
TO BUILDERS AND CONTRACTORS.

The Guardians of the Poor of the Hunslet Union invite TENDERS from competent Builders for the ERECTION and COMPLETION of their NEW WORKHOUSE and INFIRMARY at Rothwell Haigh, in accordance with the drawings and specification prepared by their Architect, Mr. J. H. MORTON, F.R.I.B.A., 30, King-street, South Shields.

Applications for bills of quantities and forms of Tender must be made to the Architect, on or before MONDAY, FEBRUARY 5th, 1900, accompanied by a deposit of £5, which will be returned on receipt of a bonâ-fide Tender. Bills of quantities, prepared by Mr. GEORGE CONNELL, of Newcastle-on-Tyne, will be supplied to such applicants only.

Drawings may be inspected, and all information obtained, at the Office of the Architect, and arrangements will be made for inspection of drawings, &c., at the Union Offices, Hunslet.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,
FRED. W. MEE,
Clerk to the Guardians.

Union Office,
Hunslet, Leeds.
January, 1900.

COMPETITIONS.

BOROUGH of EASTBOURNE.
TO ARCHITECTS.

The Corporation of Eastbourne invite Architects to submit competitive PLANS of an ART, SCIENCE, and TECHNICAL SCHOOL, PUBLIC LIBRARY, FIRE STATION, &c., to be erected at the corner of Water-lane, Eastbourne, at a cost not exceeding £20,000.

Premiums of Fifty, Thirty, and Twenty Pounds will be awarded for the designs adjudged of sufficient merit, and placed first, second, and third in order respectively.

The Corporation will be advised by a professional referee in the selection of the Plans.

The Premiated Plans will become the property of the Corporation.

If any of the premiated Plans be carried out, the Architect may be engaged to superintend the erection of the buildings, in which case the premium will merge in the commission.

Conditions of competition and instructions, with plan of site, will be sent to intending competitors on application to Mr. R. M. GLOYNE, Borough Engineer, on payment of One Guinea, which will be returned on receipt of a bonâ-fide Plans.

Plans must be sent in on or before MAY 1st, 1900.

By Order,
H. W. TOVARGUE,
Town Clerk.

Town Hall,
Eastbourne,
January, 1900.

SVPPLEMENT FOR SVRVEYORS · BVILDERS · SANITARY ENGINEERS ·

JANUARY 31ST, 1900.

BOYLE'S PATENT "AIR-PUMP" VENTILATOR.

THE LATEST PATENT HAS DOUBLE THE EXTRACTING POWER OF EARLIER FORMS AND IS ONE-HALF THE COST.

ROBT. BOYLE & SON. LTD., 64, Holborn Viaduct, LONDON; & 110, Bothwell St., GLASGOW.

See Large Advertisement, Back Page, Monthly.

NON-FLAMMABLE WOOD

Or Wood that has been chemically treated so that it Won't Catch Fire and Won't Spread Flames.

The London Non-Flammable Wood Co. Ltd.

beg to announce that their works in London, the first erected in Europe, are now complete, and they are prepared to supply Non-Flammable Wood in any quantity.

NON-FLAMMABLE WOOD.

BOARDS HAVE BEEN OFFICIALLY TESTED BY THE BRITISH FIRE PREVENTION COMMITTEE.

The Committee's Report says:—

"No incandescence or spread of flame was observed, nor did the material, as far as could be seen, contribute in any way to the spread of flame. The surface of the boards was charred."

NON-FLAMMABLE WOOD JOINERY and CABINET WORK has been specified by leading Architects, and the Company has fulfilled orders for the Royal Yacht, the Admiralty, the Crystal Palace, Mr. Wyndham's Theatre, etc., etc.

LIFT-SHAFT LININGS FOR FLATS AND HOTELS.

Use Non-Flammable Wood Matchboarding.

NO FIRE RISKS. NO PLASTERING. NO WASTE OF TIME.

Quotations will be furnished on receipt of Specifications.

THE LONDON NON-FLAMMABLE WOOD COMPANY Limited,

Regent House, Regent Street, London, W.

CAST IRON.

By W. R. LETHABY.

An interesting and useful paper was read by Mr. W. R. Lethaby last Friday before a meeting of the Architectural Association, and was followed by an entertaining discussion from several well-known craftsmen in cast-iron. Mr. Lethaby said:—There seems to be no doubt from numerous references that cast-iron was known to the Greeks and Romans; and a large use seems to have been made of it in China from an early time. It is not known whether a knowledge of how to obtain and deal with molten iron was preserved through the middle ages in any part of Europe. Lack of evidence till the fifteenth century suggests rather that it was then reinvented. In all districts where iron was reduced from the ore the iron in the furnaces approached the melting point, but until the blast furnace was discovered the heat was insufficient to cause liquifaction. Analogy with silver, bronze and lead, which were all readily cast, must always have kept the idea of casting iron in the minds of metal workers. Small objects in bronze were cast here from time immemorial; large bells were cast in the twelfth century, and beautiful full-size figures were cast in bronze in the thirteenth.

An approximation to casting iron was made in the stamping of small details while the iron was red hot into swages or moulds early in the thirteenth century. A beautiful example of this kind of work is afforded by the grate of the Eleanor tomb at Westminster, but a door at Windsor has ironwork of this kind in it probably thirty or forty years earlier. This ironwork at Windsor is particularly interesting, as (and I have never seen this pointed out) several seal-like forms have the name Gilbertus stamped on them; this work looks earlier than the Westminster example, and the chapel of Henry III., of which the door was the west entrance, was completed about 1250. It has been suggested that the running of iron into moulds was most desirable for the formation of cannon balls, and we know that cannon were already part of war equipment here, from early in the fourteenth century. Lead shot were first used, and later, as we know, cast-iron. I cannot but think that swaging the balls into shape must have formed an intermediate link.

Dr. Percy, who wrote on the metallurgy of iron, came to the conclusion that mediæval casting in iron was first practised in Prussia. Mr. J. Starkie Gardner, in an excellent paper in "Archæologia" (1898), the best illustrated and most recent contribution to the subject, argues for its origin in the Weald of Sussex and Kent. The contention, however, is, I think, not proven. Many Gothic examples of cast-iron stoves and grave slabs still exist in Germany. One elaborate stove front having figures within cusped panels—a far more important piece than anything in England—was illustrated some years ago by Mr. Brewer, and dated by him 1502. A fire-back at Bruges, dated 1565, of which there is a cast at South Kensington Museum, is a very beautiful design of two figures, cast from a model by a first-rate artist. This again, as a work of art, goes far beyond anything we can show.

The work on which the supposition of an early use of cast-iron in England is in the main founded is the grave slab of Jhone Colins, at Burwash Church, in Sussex. It is a flat slab with a small cross and an inscription in poor lettering of Lombardic character on it. I certainly have been inclined to put this down to the fourteenth century, but the fact that it would then stand alone, the earliest casting in England and probably in Europe, should put us on our guard. Mr. Starkie Gardner says its claim to be the oldest specimen of mediæval cast-iron existing is not disputed, and thus it appears to afford sure ground for the belief that the art of iron casting was invented in Sussex. The statement by Percy that Siegen, in Prussia, was the seat of the discovery, although casting was not practised there until the fifteenth century, has passed unchallenged, but Mr. Gardner thinks it probably contrary to fact. Mr. Gardner goes on to remark very properly that we can hardly suppose casting in iron was invented for the purpose of casting grave slabs, whereas a real and urgent need for castings in iron arose upon the introduction of cannon. Cannon are known to have been used in England from early in the fourteenth century. One exists which is said to be "at least as old as the early part of the fifteenth century," the interior chamber of which is of cast-iron. Now the making of war engines was at this time much developed in Germany and I should expect iron cannon to have been first made there, where, indeed, it is said they were in use early in the fifteenth.

In Stow's Annals under the year 1543 and the heading "First Iron Pieces Cast," he writes: "King Henry, minding wars with France, made great preparation and provision as well of munitions and artillery as also of brass ordinance, amongst the which at that time by one Peter Bawd, a Frenchman born, a gunfounder or maker of great ordinance, and our other alien called Peter van Collen, a gunsmith, both the King's feed men, who, conferring together, devised and caused to be made certain mortar pieces, being at the mouth from 11in. to 19in. wide, for the use whereof the said Peter, and Peter caused to be made certain hollow shot of cast iron, to be stuffed with firework or wildfire, . . . for to break in small pieces the same hollow shot, whereof the smallest piece hitting any man would kill or spoil him. And after the King's return from Boulogne, the said Peter Bawd by himself, in the first of Edward the Sixth, did also make certain ordinance of cast-iron of divers sorts and forms, as fawconet, fawkons, minions, sakers, and other pieces. Unto this Bawd, Lohn Johnson his covenant servant surviving his master did likewise make and cast iron ordinance cleaner and to better perfection, to the great use of this land. His son, Thomas Johnson, is yet living, a special workman. In the year 1595 he made forty-two cast pieces of great ordinance of iron for the Earl of Cumberland, demy cannons weighed three tons apiece." Even cast brass cannons were not made here, Stow says, till 1535, when John Owen began to make brass ordinance. He was the first Englishman, Stow adds, that ever made that kind of artillery in England. The actual founder of the cast iron pieces appears to have been Rafe Hoge; Holinshed says: "This year (1543) the first cast pieces of iron that were ever made in England were made in Bucker-stud in Sussex by Rafe Hoge and Peter Bawd."

Now we cannot traverse such direct and ample evidence as that for the introduction of casting for artillery, and I cannot think there is evidence enough to allow of our supposing that the grave slab of Burwash is any earlier; especially as a family of Collings, ironfounders, lived in the adjacent parish of Brightling. Mr. Gardner, indeed, suggests that the identity of Van Cullen himself, who made the hollow-cast shot in 1543, became merged with the Collings. Retaining the grave slab itself with the preponderating evidence that it can hardly be earlier than about 1545, and, comparing it with several late Gothic firebacks, it seems to me that there is every reason to assign it to this period. The letters on the slab are not good Lombardic ones, and such letters were used by bell-founders to a comparatively late date. Indeed, it is quite possible that they were used as dies, part of an old stock, just as we find Tudor decorations surviving for several generations on other castings. The art of decorating the earliest of these grave slabs and firebacks is strictly analogous to that used by the bell-founder by which separate devices and letters were impressed one by one into the yielding sand-mould. Mr. Gardner notes this, and, calling it a primitive process, says the firebacks decorated by this simple means afford distinct evidence that the art of iron-casting originated in the Weald and developed step by step there, and was not transplanted as a perfected art from abroad. When a sufficient number of backs are grouped together he says they exhibit an evolution from simple to complex. That, of course, is so, if you put the rude ones first; but there is nothing to justify this, and the simple elements of cable border and crossed pieces of cable used in the rudest examples occur again and again in examples which are shown by arms and other devices to be of late Tudor work.

The earliest actually dated are two of 1582. One of the most assuredly Gothic pieces of decoration on these backs is a vine trail along the top of one in a farmhouse at Buxsted, but the field of this same back is occupied by the Crowned Rose of Queen Elizabeth and her initials E. R., and even this last was old stock, for it is cast not in relief, but in matrix, and reversed. An example decorated with strips of vine and birds now on loan at South Kensington is probably the most beautiful of all, and apparently in style one of the earliest. Yet the very same pattern of parallel vertical strips of vine is found on the grave slab of Anne Forster, at Crowhurst, which is dated 1591. Another early fire back at Crowhurst, displaying the crowned royal arms with supporters, probably belongs to this same period—say from 1570 to 1590. Mr. J. C. Horsley, R.A., has an example at Cranbrook of a different type, on which the pattern was formed by circles of tracery pattern, but very shallow and poor; this back is probably no earlier.

The archæology of the subject stands thus. The earliest fire backs appear to be Elizabethan. The earliest grave slabs, which can be dated, belong to the same period, but the ornamentation of one example looks earlier; even if the early design of this were proved, however, it is quite easy to account for by the method of the old founders in using old ornaments. Finally, for cannon, which we might suppose would be the earliest things put into cast-iron, we have the most positive evidence that that was first done in 1543.

I feel some satisfaction in its being established that the use of ornamented cast iron was made by Gothic craftsmen. A reaction which followed Pugin's vital proclamation of principles swerved away from the use of such materials as plaster, cast-iron and whitewash; whereas a true application of true principles would only arraign their misuse fraudulently and thoughtlessly. The true principles of an organic art would proclaim that no material and no method is in itself outcast from the field of art, be it iron, lead, plaster, veneering, graining, casting or anything else. Iron itself, whether wrought or cast, seems to me evidently one of the noblest of materials. There is nothing mean in the idea suggested by the Iron Pillar of Delhi or the Iron Crown of Lombardy, or in the myth of Mahomet's coffin sustained in mid-air by lodestones.

In the composite image interpreted by Daniel iron stood for power: "Strong as iron: forasmuch as iron breaketh in pieces and subdueth all things." Dante built of "the moats profound; that circumvallate that disconsolate city;" and in Chaucer's temple of Mars:—

> Every pillar the temple to sustain
> Was ton-great, of iron bright and shene.

A material in which the poets can design to such effect as that is worthy of the best skill of the artist and craftsmen. Such notices as we have of the use of cast-iron by the ancients refer to its use for statues. Some quite pleasant works of a secondary order of sculpture were cast in iron a generation or two since—sleeping hounds for gate piers, and that sort of thing. The grave slabs spoken of above are no mere curiosities, rough and simple as they are; they are dignified and serious works of art. Fixed flush with the floor the walking over them is just sufficient to give them a little pleasant texture. It seems to me that this use of castings is most appropriate. A comparatively plain slab with just a little meandering border, and the field fretted all over with neatly drawn lettering, should make an excellent memorial, for if we do not continue to bury within our churches their floors might surely well receive memorials.

We cannot have art of any sort without having thoughts to put into it, but, if we had the thought and the material, cast-iron is well fitted to receive them. I am not one of those who wish to see in iron a material for a new architecture, as it is called. Mr. Ruskin, with that insight which made him refuse to talk about the fringe of a subject, saw clearly when everybody was clapping their hands over the Crystal Palace, that the finding and founding of iron is not one of the radically nobler employments, as stone hewing and setting is, or the felling and framing of timber. I would echo every word he says. But while we use iron in some degree, while we even need iron, while even it may grow into wider necessary use, I want to say, let us lend what grace we may to it, so that if obtained with cost, the greatest of all cost, an unkindly labour, it may not be mispent and more than spoilt. For in all these things it is human life we spend; for there is really no other currency.

Cast-iron was largely used in the pleasant and refined manner of building the eighteenth century London house. In the great area from Paddington to Pimlico, and Bloomsbury to Bayswater, there are an infinite number of examples of a quiet and charming taste—railings, balconies, verandahs, with graceful posts and panels of delicate lattice; or inside the house, the grates and stair balustrades were just as good.

The railings begin with the very fine design of the enclosure to St. Paul's, great baluster-shaped forms of beautiful profile; the railings at St. Martins-in-the-Fields following the same model; and there is a late example in Bloomsbury-square, where large rounded posts of this kind are used occasionally between straight uprights. Others have wide pilaster-posts at intervals, like a beautiful railing close to Apsley House in Piccadilly, or others have solid discs placed in the lozenges of lattice work, as on the west side of Lincoln's Inn. Even the ordinary area railing of straight bars has cast knobs and vase-like forms on the top, entirely good in their way, and everything so compact that you never see parts fractured.

The balcony railings are very light—a network of lattice. For perfect fitness, a natural and unashamed treatment of casting in iron, they could not be bettered. We never think of comparing them with wrought-iron to their disadvantage; both are excellent in different categories, and we might as well compare London Bridge to Lady Day, whereas modern castings do invite comparison with wrought-iron, by an infinitely careful ingenuity of pattern-making, emulating just those qualities in which to succeed is only the most of all to fail. For not the line, as in wrought work, the bent rod in scrolls, but the plate, plain or pierced, is the primary fact in design for casting.

Old London verandahs, many of them, are equally excellent, also some of the older lamp-posts. For the stair-railings, the usual plan is to have a wide, flat baluster of open work, one to each step, the metal very thin towards the view, and perhaps beaded. I remember to have seen a wide stone stair of the town-hall at Cherbourg; there was a continuous balustrade of cast plates of iron, pierced with apertures into forms, each edged all round with a delicate raised fillet; it was certainly successful. The French use cast-iron largely, and much of it designed with better taste than our own, and much, I believe, with worse. Where it is the work of one of their abler architects, as in the St. Geneviève Library, or the Northern Station, or the Palais de Justice, it is carefully studied and refined. Doors are also made of it, especially for tombs, and these are suitable, which cannot be said of the elaborate pair of Berlin castings at South Kensington, which may be taken to exemplify the "thou shalt not" of cast-iron. The grates that fill the older houses in London are, for the most part, of excellent design, and remarkable examples of careful casting; some are quite plain, with just a moulding or two, and others are fluted and beaded all over with tiny ornament on flat surfaces; the simplicity of the general forms saves the ornament from being worrying.

Again, let me say, the position I want to make clear as the point of view of these notes is not at all a claim to widen the application of iron, or that it is in any degree superior to other materials. Each material is the best, and our use of iron castings is sufficient, indeed excessive in all probability; but the claim is, that if we elect to use iron, we can do so for the direct "spiritual," if I may so use the word, appeal of the metal to the imagination; or, secondly, if for humbler and utilitarian reasons, it must be good in work and in thought—a work of art. Even the purposes which the worst and most offensive examples have served might, for the greater part, actually have been filled by cast-iron if the work had been naturally done—thought of first as use, then as beauty, and never as an imitation. The ornament, whatever it is, must be a surface decoration of a general simple structural form.

Repetition is of the very nature of cast-work. Repetition of a few simple elements in different combinations made great actual variety possible in old firebricks.

As to surface, rust is without any doubt the natural treatment, and I believe we might well let Nature have it so on occasion. Let us suppose a relief good in design, slight in finish, of the best iron, and absolutely untouched from the mould; put up under some simple pent, it will gradually acquire colour and texture—too much of both you think, but I am not sure. Remember, first of all, how frightened we are of beauty; and that natural colour and naturally-acquired texture are the very adornments to beauty herself. Decay is really much less than we suppose, especially on large rounded surfaces, and with even a small but constant amount of friction the metal keeps free from rust, or probably acquires a weather skin. Posts that block up roadways (of which there are a good many in Bloomsbury!), or the parapet of Westminster Bridge are examples; internal work, like the finely-designed gratings in Kensington Museum, becomes quite polished with ordinary wear.

Galvanising, the modern version of the tinning, which, applied to iron, is as old as Theophilus, is a valuable process. Galvanising and good oil gilding right over the surface would probably be a perfect protection, or the galvanising might be lacquered and varnished.

Electro-bronzing is another available method of which the French make use, and the dogs at Kensington are examples. We find it possible to get Japanese workmen here to furnish out a shilling show. Would it not be possible to get one or two to instruct us in their processes in iron working, and especially in finishing and colouring the surfaces? For some work oiling or varnishing may be sufficient; in many cases, of course, painting is really necessary, and for this I would recommend white, grey or black as constant colours. Simple black-leading, too, is to be entirely approved.

Some old grates are inlaid with brass, which forms flush patterns on the surface. Lead might also be suggested for inscriptions in flat slabs, and might be merely beaten into the hollows left in the casting; or even cements and mastics might be so inlaid, if only properly designed.

By way of moral I will sum up thus: (1) In designing we should give up attempts at the artistic; it is apt to miss fire. The thing to aim at is an elegant kind of engineering, straight to the point, simple and honest. Things should be finished to make them appear comfortable, as it were. (2) The forms, either solid or flat, should be homogeneous, approximating to a cylinder or a flat panel or lattice. Where modelling is applied, there should be a good space of level field, as in a coin, and the modelling, so far as possible, like a coin, should be of equal weight throughout. (3) We want exactly tabulated information as to how castings, simply treated, behave when exposed to weather without paint. We should aim at leaving the castings untouched from the mould. The Japanese in delicate kettles and the like leave the seams on; we should do the same with our bigger objects. We want to proclaim the casting, not to disguise it. (4) We should give up painting external objects Indian red, the worst of all colours for the purpose. Black or white or green are the best colours. (5) We should try to learn how the surfaces of Japanese castings are treated.

Mr. L. A. Shuffrey, in opening the discussion on Mr. Lethaby's paper, said it was singular how slowly cast-iron had emerged from he slough of detestation into which it was thrown by the Gothic Revivalists, and this was more particularly the case where it had been possible to use wrought-iron in its place, as in gates and railings, although cast-iron was much less readily affected by the London atmosphere than wrought-iron. Examples of good design in cast-iron were few, and even the vase or urn-shaped finials in combination with wrought rails and standards were fast disappearing as houses were pulled down in Marylebone and elsewhere. There were good cast standards in front of the old Portland-stone houses on the north side of Cavendish Square and at the corner of Henrietta Street and Welbeck Street consisting of a square pedestal with long fluted shaft above, and finished with a vase-shaped finial. These cast pillars at the angles of wrought-iron railings had a good effect, giving an appearance of stability which was wanting in a plain iron standard, and they were a pleasant contrast to the straight bay. Wrought and cast-iron had such different qualities that it would be generally found almost necessary to use them in combination. For monumental buildings cast-iron railings might be of massive design; they generally erred on the side of lightness. It was singular that with the amount of designing talent there was about our public lamp-posts should be so commonplace in design; the general form was no doubt a survival of the fittest, but the detail might well be improved. The electric light standards were a comparatively new feature in cast-iron design, but had not, so far as he was aware, got into good hands. There had been a great improvement in the form of pipe heads in cast-iron, many of the forms being taken from the old lead heads. They were less satisfactory than the lead ones in requiring painting, generally from frequently awkward positions, but, as down pipes were generally of iron also, it was as easy to paint the one as the other. For fire grates and stoves cast-iron was quite the best material. It could be left with the surface with which it came from the sand, this surface taking black-lead well; or the skin could be removed by the file or emery wheel, and blacked or left bright. On account of seams which showed unpleasantly on a plain surface it was customary to break up this surface with flutes, reeds, or fine ornaments, which had a good effect. This was carried out with good effect and with great refinement in the old double semi-circular grates of the last quarter of the last century, particularly by the Carron Company. Many of these had been broken up, but there were still plenty to be seen, and they certainly showed that design in cast-iron was at that time well understood.

Mr. H. Longden thought Mr. Lethaby had covered the ground very thoroughly. He showed a grate by Mr. Lethaby, for which the original model had been done in wood, which was worked upon with gesso, but carving in wood or modelling in wax might be used, according to the kind of work to be done. Sometimes plaster models cast from clay modelled work were the best to be used. There were rules to be observed as to thicknesses and specification in castings. No very great variations in thickness should be made in any castings, as these caused unequal shrinking in the cooking of the casting, and "pulled it to pieces"—to use the workshop term. Under-cutting should not be undertaken in cast-iron. It was now again recognised that cast-iron had its appropriate comeliness when properly treated; this was understood a hundred years ago. Cast-iron ought to look like itself; to do what only itself would do, and not to imitate stone, wood, plaster, or work in wrought-iron. When it was so handled it had what he might call its appropriate beauty.

Mr. R. Moreland said cast-iron and steel were both iron which had a certain combination of carbon in it. This combination might be made by mixing, in a mechanical way or chemically. When cast-iron or steel was chilled by being placed hot into water, the mechanical mixture became a chemical one and caused it to harden. The principal thing that happened many years ago was when Bessemer determined how to burn the carbon out of the cast-iron, and thus to produce nearly pure iron. This nearly pure iron he then made into steel by adding carbon. This removal of carbon could be done by putting cast-iron into a warmed bath of liquid containing oxygen; when thus treated it became capable of being bent, and was known as "malleable cast-iron."

Mr. G. H. Fellowes Prynne, the chairman, thought that the cast-iron fire backs treated in low relief were, generally speaking, better than those in high.

Mr. Beresford Pite referred to Mr. Lethaby's description of designing in cast-iron as elegant engineering as particularly apt, and thought architecture was merely sanctified engineering. It seemed to him that artistic design in cast-iron was merely a question of the suitability of the model; therefore, a consideration of what would be suitable in low-relief carving in wood would be suitable to cast-iron. He proposed a vote of thanks to Mr. Lethaby, Mr. Shuffrey, Mr. Longden, and to Mr. Moreland.

Mr. Leonard Stokes, in seconding the motion, said the thing which had struck him most had been the remark by Mr. Lethaby as to making cast-iron comfortable. The term "comfortable" appealed to him immensely; it expressed the qualification that seemed to be required in cast-iron—that of giving something you could stroke. Mr. Pite had said that it did not matter in what you modelled, whether in wood or in gesso. Mr. Stokes thought this was absolutely wrong; he did not see how carving in wood would produce a comfortable effect.

After Mr. Walter Millard, Mr. H. C. Eyres, Mr. W. H. Seth-Smith and Mr. E. Herbert had made a few remarks, the vote of thanks was carried, and the meeting terminated.

Heavy Failure of a Builder. — On January 23rd the public examination of Mr. R. Tomlinson, builder, of Adam Street, Adelphi, was held. The accounts showed a total indebtedness of £76,523, of which about £6,600 was stated to be unsecured; and an estimated surplus of £4,143. The hearing was adjourned.

Workmen's Compensation: What is a Wharf?—This question came up for solution in the recent appeal case of *Haddock* v. *T. Humphrey*. The plaintiff appealed from the refusal of the Liverpool County Court judge to award her compensation under the Workmen's Compensation Act for the loss of her husband, who was killed while in the employ of the defendants, carters, of Liverpool, at the timber yard of Messrs. Parker in Canada Dock. The points for consideration were: (1) Was the place where the accident occurred a wharf within the meaning of the Factory and Workshops Act, 1895? and (2) was the machinery—an overhead crane—which was used on the premises machinery within the meaning of that Act? Counsel explained that the yard of Messrs. Parker was about 150 yards from the waterline at Canada Dock. Behind the quay was a roadway, and behind the roadway were situate the offices of the timber merchants who had timber yards immediately in the rear. The county court judge held that the words "quay" and "wharf" were absolutely identical, and that the wharf ended at the beginning of the roadway in front of the offices and timber yards. He, therefore, decided that the yard of Messrs. Parker, where the accident happened, was not a wharf within the meaning of the Workshops Act, and that the plaintiff could not recover compensation for the death of the deceased under the Compensation Act. The plaintiff contended that any place in a dock which was not covered over, and where goods were stored, was a wharf, and that, therefore, the yard of Messrs. Parker was part of the wharf in Canada Dock. Lord Justice Smith, in giving judgment, said the conclusion he had arrived at was that the place where the accident occurred was a timber yard and not a wharf. In his view the word "wharf" meant a place which had something to do with water; it did not include a yard which was cut off from the piece of land, which, in his opinion, was the wharf at Canada Dock. The appeal was, therefore, dismissed with costs.

Surveying and Sanitary Notes.

The Estate of the late Sir Richard Thorne Thorne has been valued at £8,371 gross—£4,621 net personalty.

"Sanitation in Tenement Dwellings" was the title of a paper read before the Architectural Association of Ireland last week by Sir Charles Cameron. He said that for more than twenty years past he had held tenaciously to the opinion that the water system of conveying away filth from cities was the best. The great difficulty was in the wanton carelessness of the occupiers of tenement houses in the use of the sanitary accommodation provided for them, resulting in the flow becoming blocked. He recommended the use in outside closets of a trapless closet, on even a layer of asphalt, which, unlike concrete, was impervious to air or moisture. Mr. W. Kaye Parry said he found that where there was only one family in a dwelling the water system worked very well. The following new members were elected:—Messrs. John Knox Vinycomb, G. Hamilton Bailee, G. F. Beckett, and John Donohoe.

Manchester Sewage Problem.—In the supplement to our issue for November 22nd last we gave particulars of the recommendations made by the three experts (Messrs. Baldwin Latham, Percy F. Frankland, and W. H. Perkin, junior) appointed to advise on a comprehensive sewage scheme for Manchester. By these, and later, recommendations it is proposed "that an area of not less than 92 acres of filter beds shall be provided for the treatment of sewage by double contact." The Mersey and Irwell Joint Committee have since declined to entertain the suggestion that they should be satisfied "for a limited period with working trials of six acres of bacterial beds," and wish the whole of the sewage to be dealt with at once. The Manchester Rivers Committee propose to ask the Council to give full effect to the experts' reports, including the raising of the level of the existing tanks and the provision of four additional ones.

Claim for Altering Road Levels.—At the Norfolk and Norwich Assizes on January 23rd the case of *Hotblade and others* v. *The Norwich Electric Tramways Company* was heard before Mr. Justice Ridley and a special jury. According to the statement of claim, the plaintiffs own two houses and shops on Orford Hill, Norwich, and a piece of ground in the rear. The defendants have built a new street so that it crosses Orford Hill, raising the pathway in front of the plaintiffs' property 2ft. 10in., and so altering the levels; and the plaintiffs claimed that access to their property had thus been rendered difficult and inconvenient, and the traffic had been largely diverted. In respect of these injuries they claimed £600 damages, and an injunction ordering the defendants to restore the street to the proper level. His Lordship, in summing up, referred to the jury the following questions:—(1) Who did the work? (2) If the defendants, had they done such work as entitled the plaintiffs to claim damages? And (3) if so, what were the damages? The jury found that the work was done by the Corporation with the knowledge of the Company, and that the plaintiffs' property had sustained no damage. His Lordship said this amounted to a verdict for the defendants.

Traction Engines and Extraordinary Traffic.—At the Leicester County Court on January 23rd his Honour Judge Wightman Wood gave his decision in the case of the *Leicestershire County Council* v. *William Atkins*, brickmaker, of Mountsorrel, which was a claim by the former for £200 on account of damage done to the Loughborough Road through extraordinary traffic and excessive weight put upon it by the respondent. His honour, dealing first with the question of law, held that the traffic in question was extraordinary and the weight excessive within the meaning of the Highways and Locomotive Act. It was true that the aggregate weight of bricks (about 5,400 tons) carried over the road during the past year was the same as in the years when no damage was said to have been done, but the fact that a traction engine was now used, and a greater weight carried at one time, brought the mode of uses of the road within the meaning of the Act. (The traction engine weighed 11 tons, and the trucks, full of bricks, weighed about 10 tons. Two or three trucks were coupled to the engine.) He held, too, on the evidence as to facts, that damage had been done, but not to the extent for which the County Council claimed. There was no doubt in his mind that the road in question was during the last year made much stronger and better than in previous years, but there was no legal obligation upon the County Council to do that, and it was not an inevitable consequence of the use of the traction engine upon the road. Taking this into consideration, he gave judgment for plaintiffs for £105.

Engineering Notes.

Electroid Gas, the new illuminant, first introduced at Hunmanby, Yorks., has been interdicted by the Local Government Board as dangerous to the public.

Mr. Edward A. Harman, M.I.C.E., gas engineer to the Huddersfield Town Council, has been voted an increase of salary of £100 per annum from January 1st last, with an additional £100 increase from January 1st next.

Waterworks for Whaley Bridge.—The Whaley Bridge Urban District Council have decided to construct waterworks for their district, at an estimated cost of £7,000; they intend to construct a service reservoir to contain 247,000 gallons. It is expected that a sewerage scheme will follow.

The Decease of Professor D. E. Hughes, F.R.S., took place last Monday week. He was one of the most distinguishing electricians, and, among other things, invented the type-printing telegraph instrument known by his name. In 1886 he served as president of the Institution of Electrical Engineers.

A Notable Scotch Bridge.—The greatest engineering feat, perhaps, ever attempted in the Highlands is the railway bridge now in course of construction over Loch Etive, at the Falls of Lora. When completed, its span of 500ft. will be the second largest in Europe, coming next to that of the Forth Bridge. Sir J. Wolfe Barry, K.C.B, is the designer; and the entire superstructure will be of steel.

Electric Light at Govan, N.B., has been provided. The installation is on the three-wire continuous current 250-volt system and has cost about £26,000, which is about £8,000 in excess of the estimate. There are two boilers by Babcock and Wilcox; electrical machinery by the British Thomson-Houston Company; accumulators by The Tudor Company; cables by the Callander Company; and arc lamps by Crompton and Company.

Institution of Mechanical Engineers.—At the fifty-third annual general meeting of this Institute, held on Friday last (the president, Sir William H. White, in the chair), the annual report was presented. This shows that at the end of last year the membership was 2,922, as compared with 2,684 for the previous year; but there has been an excess of expenditure over revenue of £453 11s. 7d. The sum of £59,214 0s. 7d. has now been spent on the Institution House, which is the chief cause of the excess expenditure.

Masters and Men.

A Strike at the Paris Exhibition.—The carpenters employed on the Paris Exhibition buildings have struck for an increase of wages.

National Building Trades' Federation.—At the forthcoming conference of this Federation in London, the following gentlemen will represent the Bradford Builders' Association: Alderman Wm. Holdsworth, Mr. P. Drake, Mr. Wm. Moulson, Mr. A. Moulson, Mr. A. Gadie, Mr. Obank, and Mr. Copley.

Reduction of Wages in Dundee.—A movement has been started throughout Scotland to reduce the wages of the workmen in the building trades—joiners, masons, plumbers, painters, slaters, and plasterers—and in several districts intimation has already been made that the wages are to be reduced to the extent of 1d. per hour. Last week the members of the Dundee Master Builders' Federation agreed that a reduction of 1d. per hour should be recommended all round in the various branches of the trade, and to bring it into effect according to the terms of the by-laws in force between the employers and employed. In the case of the plasterers, however, it was stated that they had a Federation of their own, and before any steps could be taken in regard to that trade the Federation would have to be consulted. It is stated that the present position of the trade was not satisfactory. Old contracts are being worked off, and very few new ones are forthcoming; while the price of material is on the increase, the cost of certain kinds of wood, for instance, having risen ten per cent. since the New Year.

The Trades Union Congress will meet at Huddersfield in September, and arrangements for the reception of it are now busily being made by the Huddersfield Trade and Labour Council. All the local arrangements necessary for the lodgment and entertainment of the delegates will be carried out by committees of the Council, which, as a body, has already secured from the Town Council the promise of the free use of the town hall for the transaction of congress business. The hall is as convenient as it is commodious, and well suited for a gathering of the kind, having a large platform and an orchestra, so called, for the accommodation of speakers. The Trades Council have appointed finance, reception, and entertainment committees. The first-named committee, probably, will secure their funds chiefly by means of donations from within their own body. The local trades unionists number about 4,000, and it has been suggested that each member should contribute one shilling to the Local Expenses Fund, and it is believed that the sum thus secured would be sufficient to meet all the demands that would fall to the local Trades Council to bear. Members of some trades would not be able to contribute so much and others would probably contribute more.

Strike of Plasterers.—Last week the Scarborough plasterers struck work because of the refusal of the masters to sign their rules with the London agreement embodied. The Scarborough masters did not join the national lock-out of plasterers last spring on the ground that they had no grievance, and were not affected, and because the majority of union plasterers in the town were not employed by members of the masters' association. A settlement of that dispute was arrived at in May, but as the Scarborough masters had not joined in the lock-out they contended they were not bound by the settlement. At this time, owing to the Hull dispute, a lock-out was ordered of all trades by the Yorkshire Federation of Builders, and the Scarborough masters joined in the lock-out, which included 25 per cent. of plasterers. The result was that the whole body of union men came out. Eventually an agreement was arrived at, and they returned to work. The plasterers contend that the rules which applied to their trade were rendered null and void, and that new rules should be drawn up, in which the London agreement should be incorporated. This the masters declined to do, alleging that the agreement with reference to the demarcation of work and that with reference to the number of apprentices were not feasible in Scarborough. The masters have resolved, in face of the strike, that no union plasterers employed either by contractors or sub-contractors shall be allowed to work on works under the control of members of their association, and they further declare that the national rules are not workable in Scarborough and district.

Builders' Notes.

Advance in Prices for Baths, Lavatories, &c.—Messrs. Morrison, Ingram and Co., Ltd., sanitary engineers and brass and iron founders, of Hadfield Street, Cornbrook, Manchester, inform us that they are again compelled to advance the prices of some of their manufactures as follows:—Fine cast, plain painted 3rd and 2/2nd class baths (discount reduced 5 per cent.; the higher qualities remain for the present as advised August 10th, 1899); lavatories and sinks (discount reduced 5 per cent.); water-closets, cisterns and flushing tanks (discount reduced 10 per cent.).

Messrs. Julius Sax and Co., Limited.—In our issue for January 10th we stated that this firm had intimated to us their willingness to send a copy of their new calendar to any of our readers who would communicate with them. A correspondent writes expressing some annoyance that his request for a copy was not complied with by Messrs. Sax, who said that they would send the calendar on receipt of a "trade card." It is, of course, not unusual to confine such offers to the trade, but we agree with our correspondent that some trouble and disappointment would probably be avoided if an intimation of the offer being so restricted had been made in the first instance.

Covering Manholes: Damages Against a Builder.—In the Dundee Sheriff Court on January 23rd, John Rodgers, a labourer, sued Robert Laing, a builder, for £12 as damages in respect of personal injuries. He averred that on November 11th he fell through a manhole in Rattray Street, owing to its not being sufficiently covered by the defendant. It was pleaded that it was no part of the plaintiff's business to go near the manhole. The sheriff found for plaintiff for £3 and 10s. costs, and said that, even though it was no part of the plaintiff's duty to go near the manhole, defendant was at fault in allowing it to remain accessible to him.

Paper Roofs.—In connection with the statement that the Tokyo Card and Pasteboard Company, the largest in its line in Japan, were making a thick, tarred pasteboard as a substitute for shingles in roofing, the "Indian Textile Journal" says that what is required for the production of cardboard is a supply of coarse fibre and a cement to hold it together. India lacks neither of these, although they have not yet received sufficient attention. The uses of a strong and well-made cardboard include boxes, panels, partitions, roofing, ceilings, bookboards, and advertisement cards of all sizes. The tarred cardboard would not suit on a roof in India on account of its disposition to heat in the sun and soften. It would also require to be prepared with pitch of very high melting point to stand even the shade temperature. A paper roof would be far superior to sheet iron as a protection against the sun, and paper panels with an embossed device on them would offer a very neat, light and substantial filling as panels for screens.

London County Council.—At the reassembling of the Council on Tuesday in last week the Housing of the Working Classes Committee reported that they had framed a scheme, at an estimated cost of £500,000, for the erection of cottage dwellings at Totterdown Fields, Tooting. They recommended that the Council should purchase the estate of 38½ acres at a cost of £45,000. The proposed cottages would each provide for two families, and would consist of two self-contained tenements, one of two and one of three rooms. Separate gardens would be provided for each tenement, and, on an average, not less than thirty cottages would be built to the acre. The report was agreed to. The Finance Committee brought up a report showing that during the half-year ended September the completed works had cost £23,376 19s. 3d., as against an estimate of £23,964 17s. 7d. The total amount spent on the jobbing works was stated to be £36,275 19s. 7d., as against a schedule value of £38,929 13s. 4d. The report also showed that the total estimated cost of all works carried out since the establishment of the Works Department was £838,642, as against a total cost of £883,232, thus showing a loss of £44,590. Mr. Beachcroft pointed out that the loss on artizans' dwellings alone was £19,300. The Improvements Committee recommended the adoption of the estimate of £2,742,500, the balance of the cost of property and re-housing in connection with the new street from Holborn to the Strand. A sum of £2,000,000 was voted in August last. This was agreed to.

COMPLETE LIST OF CONTRACTS OPEN.
